STATE LIBRARY.

When, from whom, and how this volume was obtained, with the price paid, if any, may be found opposite the above number in the Register of Books, which is always open to inspection.

Extract from the Political Code.

SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books, or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

☞ The Foregoing Regulations will be strictly enforced. ☜

MINING AND SCIENTIFIC PRESS.

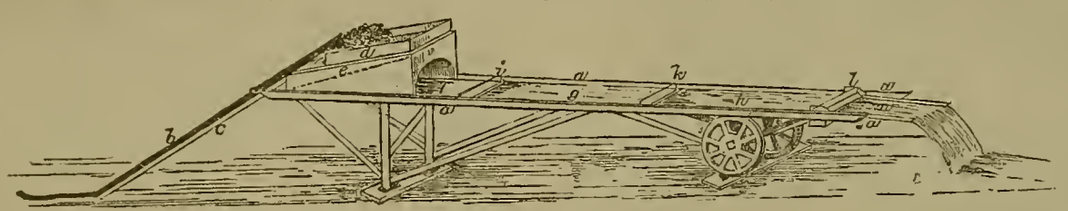
An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, JULY 7, 1883.

VOLUME XLVII Number 1.

Beach Mining For Gold.

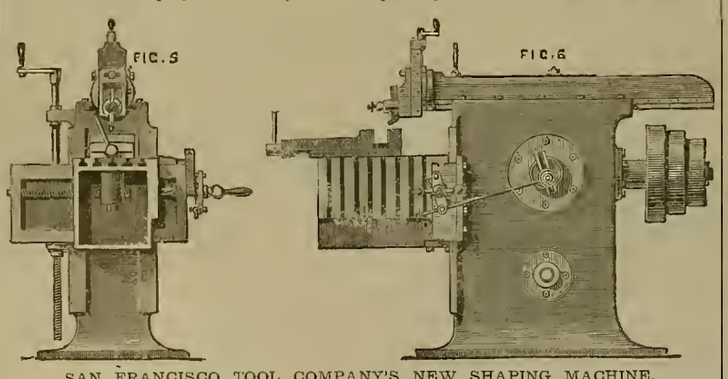


In the last number of the Press we gave a brief description of the beach mining for gold in Australia. We give in this issue an engraving of the machine there used. It is said to be successful, and as we have many gold beaches on our coast, perhaps this machine might be successfully introduced here. Warden Revell, a resident of the locality where this system is carried on, thus describes the machine:

The illustration is a sketch of a "beach-box," which is a fair representative of those now in use. The frame *a* is built entirely of timber, and from end to end measures fourteen feet. The hind legs are two feet high, and at the lower end the floor is eighteen inches from the ground. The fall is regulated by raising the legs or wheels, as may be necessary. The "hose" *b*, is three inches in diameter, made of stout canvas, generally tarred to preserve it and render it water-tight — through which the water is brought and carried up the "leader" *c*, thence emptying into the "hopper" *d*. The bottom of the hopper is a sheet of perforated iron, two feet square the size of the hopper. The perforations are one-fourth of an inch in diameter, and generally about one inch apart. The sand is shovelled into the hopper, and the finer part of it is carried through the perforations by the water, and drops upon the "slide" *e* (shown on the sketch by dotted lines), within the box below the hopper. A copper plate is laid over this slide, coated with mercury, to which the gold attaches itself. This slide is two feet wide and three feet long. At its lower end an opening is left two inches from the plate beneath it, and the same space from the end of the box, so that the water may drop on the next plate, *f*, and from that over the plates *g* and *h*, which are also overlaid with mercury. At the bottom of plates *f*, *g*, *h*, "rifles," *i*, *k*, *l*, are placed; *i* and *k* are formed by leaving a space between the plates, so as to form a hollow into which the water must drop before reaching the next plate. Above these two rifles slides are placed to break the impetus of the water when it reaches them, and force it more gently under them. The last rifle-box is of different construction from those above. It is five inches in depth at the upper side, thirteen inches in the lower, and five inches wide. In the center a slide is placed, and pushed down to within two and a half or three inches of the bottom of the rifle-box. The sand and water drop into this box, and are forced out again at the lower side of the "slides," thence running over the last table, or "tail-board," *m*. The object of the two first rifles is to break the force of the water, and that of the rifle-box is to catch any loose mercury that may come off the plates above it, and which on account of its weight, cannot be forced out again by the water. On the "tail-board," instead of mercury, "baize" or blanket is placed to catch all "rusty" gold that the mercury will not take. On the lower side of each rifle a "flange" is nailed so as to overlap the plate below, and thus prevent the water passing beneath. The plates are secured to the frame by battens, and are nailed at top and bottom. Each plate usually weighs about 14 pounds.

When sufficiently rich, the plates are taken from the frame and set on end, so that the loose mercury may run off. They are then scraped with a chisel, both gold and amalgam being taken off.

After all the mercury possible has been squeezed from the amalgam, the latter is retorted in the usual manner to free the gold of the mercury entirely. Should any of the copper have been scraped off with the mercury, it will remain with the gold, which latter has then to undergo the process of refining at the bank.



The working results of these claims are various and almost impossible to estimate, the beaches being often unworkable for months, for it is only heavy seas and strong winds that bring payable gold upon them. Revell thinks, however, that the average wages throughout the year would not be less than 2l. 10s. per week.

APPARATUS USED FOR GOLD BEACH MINING IN AUSTRALIA.

New Shaping Machine.

The machine here shown is among the late machines produced at the works of the San Francisco Tool Company. It has a quick return and a stroke of twelve inches. The table lowers to receive twenty-four inches. The tables have horizontal and vertical faces, and are provided with revolving vise boxes, or plain clamp vises, as shown above. They are strong, substantial tools, and in every way suited for the rough use such machines usually have to endure.

SAN FRANCISCO TOOL COMPANY'S NEW SHAPING MACHINE.

Work is now being resumed on many of the base ore prospects along the range between Pioche and Bristol. The prevailing idea that the Day furnace will resume work at no distant day is the cause of it.

Secretary Teller has recently decided that applicants for mineral patents may designate the name of the paper in which they desire the advertisement of such application to be published.

Test Silver for Blowpipe Use.

The silver used for both qualitative and quantitative examinations by the blowpipe must be chemically pure to enable the operator to make accurate and reliable assays for either gold or silver. For convenience, it is best to have the silver in two forms, one in the shape of an ingot, say about 1½ inches long and ¼ inch square: the other should be in thin foil, which latter may be found most useful in the gold assay.

If chemically pure silver cannot be procured from a reliable source, such as a mint, a first-class laboratory or assay office, George Attwood, in his "Practical Blowpipe Assaying," gives directions for preparing it as follows: Dissolve the purest silver that can be obtained in weak nitric acid, dilute with water, allow the solution to settle for several hours, after which decant carefully and reserve for use only the portions that are perfectly clear, to which add a solution of chloride of sodium (common salt) until the white flocculent clouds of chloride of silver cease to appear. The precipitation is then complete. Filter and wash the precipitate repeatedly in warm distilled water; then dry and fuse (in a new and perfectly clean crucible) with its own weight of crystallized carbonate of soda and about one-eighth of its weight of pure nitre. The heat should be applied gently at first, and finally raised to the fusing point of silver; and when cold, the crucible should be broken, and the button of silver carefully washed. The silver must be again dissolved in nitric acid, water added, the solution allowed to settle, and great care taken in decanting, as before. The silver is precipitated as before, and the precipitate repeatedly washed for twenty-four hours with warm distilled water. Dry, and again fuse with carbonate of soda. If this process is carefully carried out, the silver obtained will be found to be chemically pure.

Sir Michael Bass, of pale ale fame, has given £173,000 for popular institutions.

Advancement of Science.

The American Association for the advancement of Science meets at Minneapolis, Minn., on the 15th of August next. As considerable interest is manifested in this large association we make some extracts from its cases relating to the classes of members, patrons, etc.: Any person may become a member of the association upon recommendation in writing by two members or fellows, nomination by the standing committee, and election by a majority of the members and fellows present in general session. Fellows are nominated by the standing committee from such of the members as are professionally engaged in science, or have by their labors aided in advancing science. The election of fellows is by ballot and a majority vote of the members and fellows present in general session. Any person paying to the association the sum of $1,000 is classed as a patron, and entitled to all the privileges of a member and to all its publications. The name of any member or fellow two years in arrears for annual dues is erased from the list of the association, provided that two notices of indebtedness, at an interval of at least three months, shall have been given; and no such person is restored until he has paid his arrearages or has been re-elected.

The admission fee for members is five dollars in addition to the annual assessment. On the election of any member as a fellow an additional fee of two dollars is to be paid. The annual assessment for members and fellows is three dollars. Any member or fellow who pays the sum of fifty dollars to the association, at any one time, becomes a life member, and as such, is exempt from all further assessments, and entitled to the proceedings of the association. All money thus received is invested as a permanent fund, the income of which is used only to assist in original research, unless otherwise directed by unanimous vote of the Standing Committee. All members and fellows must forward to the permanent secretary, as early as possible, and when practicable before the convening of the association, full titles of all the papers which they propose to present during the meeting, with a statement of the time that each will occupy in delivery, and also such abstracts of their contents as will give a general idea of their nature, and no title is referred by the Standing Committee to the Sectional Committee until an abstract of the paper or the paper itself has been received.

Table Mountain Nickel Mines. — A Lovelock correspondent informs the *Silver State* that Bell, Curtis & Co., of San Francisco, have a number of men at work developing their nickel mines in Cottonwood canyon, Table mountain. They have several veins, from a foot in width upwards, that assay from twenty-five to forty-five per cent nickel, while the main lead is from twenty to 100 feet wide and carries from five to eight per cent of nickel. They are running a tunnel to crossent this ledge at the depth of 200 feet, and Mr. Bell, who is an experienced miner, is giving the matter his personal attention.

CORRESPONDENCE.

Howells—A New Town.

Walker District, Yavapai County, A. T.

[From our Arizona Correspondent.]

It was my privilege to-day to spend a few hours visiting the "Howell Smelting and Mining Co.'s" properties, situated at Lynx creek, twelve miles southeast of Prescott, the capital of Arizona, and also the county seat of Yavapai county.

This twelve miles has now an excellent hilly road, and the county has a large force of men working out a $15,000 appropriation for improving and extending this road through to the Black Canyon road to Phœnix, to shorten the mail route some fifteen miles between Prescott and Phœnix, and accommodate a rich and rapidly developing mining region with daily mail and freighting facilities. By this sensible move on the part of the Commissioners, they get a donation of the free use and ownership of fully 88,000 worth of graded roads, already made by John Howell, for the use of the Howell mines and smelting works. The additional labors of the county in extending the road will prove a great benefit and public convenience; and a few years' continuance of this good road policy, and the direct results and influences will more than double the resources of the county.

Last fall Mr. Howell was clambering about those pine-covered and rocky hills

To Make a Plant

For smelting and reduction works for the ore from the Belle Mine, situated beyond Lynx creek two and one-half miles, over high and rocky hills. He decided to plant the works on Lynx creek, and grade a road to the mines. The inconvenience and cost of lumber showed the economy of first erecting a sawmill, and cutting the pines growing near by for his building lumber.

But I hasten simply to mention some results of a very few months of well planned labor programme. There stands a thirty ton water jacket (Rankin & Brayton, S. F.) smelter; one eighty ton Howell cylinder rotary oxidizing furnace, to prepare rebellious ores for the smelter; a Wheeler crusher, of largest capacity; a small mill for reducing ore for accurate sampling; a steam engine of ample capacity to furnish the power for double the present plant. It would require a lengthy article to particularize, or even mention a small portion of the points of convenience secured by ingenious planniugs, positions and mechanisms, and even the most unshapely roughness of the location is used just as if it was intended and fashioned for a most perfect and

Labor Saving Reduction Site.

The steam engine moves the automatic combinations. The rock received from the teams on the upper terrace floor, falls into the crocodile jaws of the crusher that rapidly reduces it to the proper fineness or size, and it is thence automatically and regularly transferred to the rotary cylinder furnace, which revolves slowly as the heat passes through it. The cylinder is placed at a slight inclination, and as it revolves the ore within it is dropping from top to bottom and slowly passing downward toward the lower and hotter end, and gradually loosing its sulphur, arsenic, antimony and various properties that interfere with the most successful smelting.

This Howell Rotary

Was considered the greatest achievement of American success in the great problem of working the rebellious ores of Nevada, where it was used with eminent success as a chloridizer of the precious metals, and at the same time oxidizer of the base metals and thus preventing their being amalgamated, they were carried off with the tailings, and the dechloridized silver in the ore would then amalgamate and give from a base ore a result of fine bullion.

This one metallurgic achievement, in comparison with all the other devices calculated to attain the same results, stands out chief and alone, if viewed in its economic, healthful and successful records. This is one of the many silver ore machines that we take a special pride in, its being of Pacific coast origin, and one that every progressive mining nation will sooner or later adopt.

The smelter has been running now one month from 1st of May, has shipped crude bullion to amount of about $25,000 to Chicago by the A. P. R. R., sixty miles freighting by teams to depot at Ash Fork. The freight of nearly ninety tons of bullion out, and the coke brought in, amounted to 230 tons for this first month.

The Trinidad coke costs at furnace $36 per ton, but when the railroad now talked of, and surveyed, to Prescott, is completed (if ever), then the same coke would probably cost not over $16 per ton, and other expenses be reduced in similar proportion.

Improvements Making.

There is a large force of men employed in shaping the foundations for future and immediate additions. Another and larger water-jacket smelter beside the present one, and a stamp mill with pans, and settlers with Frue concentrators, will be immediately erected to dispose of a class of free-milling ores rich in gold and silver to better andvantage than by smelting and selling with lead bars. The concentrators will save the principal portion of the sulphurets, that are more or less seamed into the free-milling ores, and then these sulphurets will be passed through the smelter.

Refining and Reduction Works

Will also be put up, with cupel hearths to refine the base bullion, by converting the lead into litharge (oxyd of lead), and use that as flux for the furnaces, when needed, and bar the bullion, as fine silver and gold, instead of lead, as now shipped.

The sawmill attachment has now been disposed of, and the space utilized for extensive charcoal depository. This article is abundant, furnished at 15 cents per bushel.

The materials for these improvements are now mostly on the ground, and, when all is ready, will soon become a part of the plant. The great demand for supplies for the company and employes made it necessary early to lay in a large stock of such articles as are needed in such a camp. They order merchandise by full carloads, and thus get supplies at least possible cost, and from a bulletin board on the front of the store, I noticed some articles even 20 per cent cheaper than they were selling in the stores in Phœnix. The stock seemed of choice goods, and no bar attachment. But in this respect, the new town of "Howells" is amply supplied. As a miner counted them upon his fingers, he said: "There are nine whisky shops now in this camp." I have no space to moralize. The wise ones (saloonists) predict, of course, a great future for this camp. That a large amount of bullion from this and the many other less developed properties that must soon attract capital will make this a center for business, and hence their haste to set their traps early.

There are hundreds of smart business men who rely very much on the judgment of these saloon-men in making up an estimate of the future prospects of a locality. They certainly say by acts that this camp has backing. But I prefer to drop this and see where John Howell, our old Nevada youth of sober, steady habits and sound judgment, got his inspiration to make this wild plant far out among rocks and hills. So I will, or rather did, visit the mine that produces some of this hope I visited

The Belle Mine

Near Lynx creek, Walker district, Yavapa Co., expecting to find a hole in the ground several feet deep, etc. My open note to the mine foreman brought me in friendly relations with a nobleman, though dressed for his occupation of going anywhere in and about the mine, and entirely devoid of any official badge, except the square countenance of a thorough, reliable business miner. I am sorry I am prohibited by his request from mentioning his name. It would cheer many an old Comstocker and Eastern Nevada miner to know he is yet occupying a place of trust and responsibility, and enjoying the labors that make much for others' wealth. Having donned a miner's jacket and hat in the whim house, I took a lighted candle, and we proceeded to descend by a ladder in the shaft, all made firm and safe. All the way down as I faced the foot wall (but it was almost perpendicular), to my left was the ledge as it was broken off by the picks, gads and powder. It started at the surface small but gradually widened out to two feet or more, eye measurement, and this with slight wavings of the casings continued on down with us till we landed on the 105 level. We now pass through the tunnel, to the north, in the ledge, or the space which the ledge had occupied, and could inspect it every foot of the way overhead for 180 feet, to where we find the men driving on the tunnel. Here my guide took the hammer and gave some signal blows on the end or face of the tunnel, and they were quickly answered by rappings from a similar spirit on beyond us, who had started where the ledge outcropped on the hillside, and were aiming to connect with this tunnel; will speak of that again. The ore in this tunnel just passed over, is of a beautiful clean character, free from cab or waste of any kind, and a varied galena, with some elegant copper stainings, with oxide and carbonate of lead; in some portions it carries considerable free-milling gold and silver ore. Then from shaft and ladder, south, all the way in the continuous ledge 240 feet, brings us to the face of the tunnel and facing a beautiful full ledge. Some few stopings have been opened, which developed some very massive deposits of high grade smelting, and some free milling ores. Having thoroughly satisfied myself that every foot of drift here showed a very uniform and perfectly regular vein, we climbed slowly out, admiring what was glittering all the way up. Now, again on top, we go to the north and down the hill to the first tunnel going in on the end or edge of the ledge, toward the south ninety-four feet, all in the ledge same as we found in the tunnel, where we heard the raps from this open tunnel (soon to open into the other tunnel). Coming out we go down the hillside 100 feet more and enter the tunnel to connect with the 210 feet level as measured at the main shaft. This drift of 460 feet is all in ledge of same character, only gradually enlarging and improving, but of same character as above. This is the 210 feet level of the main shaft, which extends yet down to the 300 feet level, all the way in ledge and pay ore, regularly formed and gradually enlarging, as developed below. The entire work so far, is simply to show if it is a mine and to get tunnels with car tracks all ready for stoping out ore in a business way. As yet a simple whim with rope and bucket has sufficed to hoist for exploration developments. Now the machinery is on hand and the timbers hewn and sawed for a

First-class Hoisting Works

With wire cable and steam power—and the ore dump to be constructed with chutes for convenient loading of wagons. But while this work is being done ore sufficient to run the present furnace can be run out to the two tunnel dumps each having well graded roads for teams.

Mr. Howell has forgotten so far, all about exterior show. About the whole mine the only planed lumber is the ladder, and even his own family residence, in Howell, is free from all expensive show, and if my recollection is correct, I think it like the others, is yet of pine color, or unpainted and very plain. We had an excellent appetite for dinner, after finishing our explorations out and in the mine, and about 1:30 enjoyed dinner at the mine boarding-house, which was a fuller supplied table than the average of first-class hotels.

After dinner, retired to the foreman's office, a comfortable log cabin, where he enumerated his employes in and about the mine: Two cooks and table waiter, three packers, etc. The miners and graders in all amounted to 60 men. Wages for miners, $4 per day; others, $3.50 and $3; each paying $9 per week for board, unless they board themselves. There is quite an

Extensive Pay-Roll

Of workers at and about the smelter. This, with the many buildings being erected in the town, makes this one of the mining camps of old, especially when a dozen big freight and rock teams are encamped there for the night. All this stir comes from the faith of Boston capitalists in John Howell, and the faith that John Howell has in this Belle mine and other mines of Walker district. He was ready to back his faith by his own capital, and they acting largely on the faith in others' statements, invested, and now have the satisfaction of seeing a vast and successful wealth creating enterprise progressing.

In all my intercourse with the most practical business men, and those of mining and milling experience in this Territory and Nevada, I have never found one to speak disparagingly of Mr. Howell's skill and abilities, or any word derogatory to his character as an upright and thorough business man. Whatever may be the share owned by any distant partners, they have entrusted it in able and reliable hands, and from present appearances, nothing but some calamity can prevent their venture from that success which all in this vicinity prophesy and wish for it.

The Belle mine, though perfect in its dip, and a north and south true fissure vein containing within itself the requisite fluxes, and various favorable features, is by no means the solitary ledge of this district. I am told by disinterested parties that there are richer ores, and some other fine properties near by that await the arrival of capital to place them in paying position.

Maj. C. P. Dake, one mile above the Howell smelter, has a water-jacket smelter and reverberatory furnaces, also a good sawmill and several mines of good repute, but a financial embarrassment holds it back from successful operation at present.

Lynx creek has for years been mined in flood season for surface gold. Some good fortunes have been made here, and the wealth deposits are yet just being opened. B. W. CROWELL.

Prescott, A. T., June 1, 1883.

Wood River Bullion.

The Wood River *Times* of June 20th, says: The first freight destined for Omaha, via the Wood River Branch, the Oregon Short Line and Union Pacific railways, was received at Hailey on the 25th of May—about 15 days ago. Since that date the following shipments have been made:

BASE BULLION.

DATE.	BARS.	DATE.	BARS.
May 25	960	June 5	240
" 26	720	" 6	240
" 29	480	" 7	480
" 30	240	" 8	240
" 31	240	" 9	240
June 1	960	" 11	480
" 2	480	" 13	480
" 3	720		

Total, 720,000 pounds of base bullion.

The only company that has shipped ore to Omaha since the railway has been completed, is the Mayflower, which shipped as follows:

ORE.

DATE.	POUNDS.	DATE.	POUNDS.
May 31	68,000	June 7	24,000
June 2	48,000	" 8	48,000
" 3	24,000	" 9	24,000
" 5	24,000	" 12	24,000

Total, 284,000 pounds of ore.

The bullion carries an average of 300 ounces silver and 70 per cent. lead, and the ore averages 200 ounces silver and 70 per cent. lead per ton. The value of the shipments above given is therefore in the neighborhood of $177,000. If to this be added the value of the ore shipped by the Mayflower company since the first day of April of this year—about $90,000—it will be seen that the value of our ore and bullion shipments so far this year exceeds $265,000.

This, when the rate of freight on ore and bullion—$30 per ton—is taken into account, will be admitted to be a very good showing indeed.

The Silver King Mine at Calico.

The following is from the *Calico Print*, San Bernardino county: This mine is earning for itself a record that will eventually place it foremost among the rank of great mines on the Pacific coast. Up to the 1st of January last its progress was slow in its development, but since then it has made considerable advancement, and is now in excellent working order, and is turning out a good supply of bullion every week. Under the able management of Mr. A. Barber, the superintendent, assisted by Mr. Al. Waite, the foreman, the mine is worked in a systematic and careful manner, and is producing results that are quite satisfactory to all interested parties. We are indebted to the superintendent for valuable information concerning the condition of the mine, and to the foreman for his kindness in showing us through the various levels, and describing the characteristics of the ore deposits, and the veins that have been opened up, besides the different methods employed in all its operations. We were informed that Nadeau's ore teams, that haul the ore forty miles to the company's mills at Oro Grande, are supplied with twenty tons of free milling ore every day, and that the average milling returns per ton from the ore is $90. Up to date 3,200 feet of openings have been made in the mine since December, 1882. At present, forty persons are employed in and about the mine. In company with Mr. Waite, we ascended the steep hillside, while the thermometer was on tip-toe, and trying eagerly to reach 115° in the shade, but failing to force the quicksilver above 100°. When we reached the highest level the view of the landscape below and beyond was grand and interesting.

We first entered the first level at the west end. This level extends through the hill in a westerly and easterly direction, is 400 feet in length and at a depth of sixty feet from the summit. It follows the ledge from the foot wall. Eighty feet from the entrance a winze has been sunk to a depth of eighty-six feet, which contains ore from top to bottom. In this level there are fifty-four feet of crosscuts, and 250 feet of stopes, besides an upraise of fifty-five feet. A car track is laid nearly the whole length of the level, the waste rock being run out in the ore car to the mouth of the tunnel and dumped down the hill, while the ore is dumped down a chute to the second level, and from thence to the fourth level, where it is run out on the tramway to a large chute. In this level numerous rich pockets have been opened, some of the assays from which reached as high as $1348.

Along a considerable portion of the wall, which is on the north side of the level, no ore was uncovered; but on the south side drifts have been run in following veins that carry ore, assaying from a few dollars up to hundreds of dollars to the ton. We next passed along the second level which is in two hundred feet, which contains good milling ore its entire length at frequent intervals. We next examined the third level, which is in 650 feet, and has three upraises. No. 1 is thirty-five feet high; No. 2, 40 feet; No. 3, ninety feet; cross cut forty feet. Large quantities of ore have been taken from this level. We next entered the fourth level where we found considerable work had been done. The length of this level is 540 feet, and it runs in a north-westerly direction. It contains a cross cut of seventy feet and three upraises, the first sixty feet high, the second sixty feet, and the third twenty feet. Two winzes have been sunk; the first one to a depth of seventy-five feet, and the second sixty feet. In the fourth level, 200 feet from its mouth, running in a northeasterly direction, is a cut-off which extends upwards through all the levels, and which contains no ore as far as it has been prospected. Ore can be seen in this level along the ledge in many places, in pockets, which sometimes yield rich ore and sometimes low grade, but which will average over $100 to the ton. All the ores from the levels above are lowered to this level by means of chutes, and then hauled out by cars to the smallest of the large chutes. At the month of this level is the company's blacksmith shop, which is kept constantly busy making and repairing implements used in the mine. The lowest level runs in a northerly direction, and is 375 feet from the apex of the mine, and is 550 feet long. At a distance of 400 feet from the month of the tunnel is an upraise of 170 feet. In this level several veins of ore have been cut through. But it is the intention of the managers to cut through the ledge before any quantity of ore will be taken from this level. After awhile connection will be made from this level to those above, and all the ore that now passes out of the fourth level into the two large chutes will be discharged from the fourth level into the new 60-ton bin a short distance above the superintendent's office.

There are on the dump about 2,000 tons of third grade ore, which averages about $25 to the ton, which it will not pay at present to mill, but will probably be reduced when a quartz mill is put up near the mine, which will, no doubt, be done at some time, not far in the future. Good roads have been graded to the mine, and every improvement is being made that will lessen the expense of operating the same, and no doubt some day a tunnel will be run from Wall street canyon, under the town of Calico, into the mine, out of which the ore will be taken in ore cars.

MECHANICAL PROGRESS.

Solid and Hollow Iron Columns.

A confusion of ideas is sometimes found among practical men respecting the comparative strength of solid and hollow pillars. One hears it often said, says the *Building News*, that a hollow pillar is stronger than a solid one. Now, this is, as one able authority has pointed out, not absolutely the case: it is perfectly true that, comparing the strength of two pillars of the same hight and diameter, one solid and the other hollow, the latter has the advantage of being economically stronger. The fact is, the solid column is stronger than the hollow of the same external diameter: but the lesser area is more effective than the greater, because the central portions of the solid pillar are less useful in resisting the bending force than the metal in the circumference of the hollow pillar. But if the quantity of material in both the solid and hollow pillar of equal hight is the same, the hollow pillar is by far the stronger. A simple geometrical construction will enable any one to understand the fact, by enabling us to proportion a hollow column of the area as that of a solid one, by one of the diameters being given.

It is shown, in fact, that hollow columns of the same area of metal as the solid one may be made to any larger diameter, their strength increasing proportionately till a limit is reached by the shell of the metal becoming too thin to insure a sound casting. Taking an example from Downing's work a hollow pillar nine inches in external diameter, having an internal diameter of 8.062 inches, and a thickness of metal of 0.47 inch, or about one-half inch, is five and one-half times stronger than a solid pillar with the same quantity of metal. A thickness of one-half inch may be regarded as a practical limit in manufacture.

VISIBILITY OF RULED LINES.—In regard to the "visibility of ruled lines on glass," to which reference was made in these columns two or three weeks since, a correspondent of the *Scientific American* says: I find that lines properly ruled on glass are similar to graven lines: they are smooth, clean cut, having a definite shape and depth. Such lines are always visible in the microscope, and central or oblique light will show the bottom of each cut as a dark or colored line, plainly visible, and requiring no graphite or other foreign substance to indicate it. The microscope is the test for a properly ruled line. The mechanical elements (pressure, etc.) entering into the process of ruling are not at all evidences that lines have been properly ruled. The slightest accident to the point of the cutter, or the surface of the glass not being perfectly clean, will spoil a line; that is, produce a scratch which cannot be satisfactorily illuminated in any light. Well ruled bands of lines, 70,000 to 80,000 to the inch, are visible in the microscope with central light; and with a Smith vertical illuminator (giving central light), I have seen 100,000 lines to the inch. As these individual lines have a width of about 1-200,000 of an inch only, it follows that the difficulty is not to see such a narrow line, but to eliminate the diffractions which tend to blur the image in the microscope, and so prevent the resolution or separation of the lines in a band of them.

THE TREATMENT OF CEMENT.—At an assembly of German manufacturers an interesting report was made by Von Froideville, in which he asserts that a really good cement, one that has been suitably mixed, not only does not crack, but even in a northern climate is able to resist the weather. If, however, too much water has been used, so that a mossy crust forms on the surface, and the whole mass is not homogeneous, the cement checks or cracks, and as soon as hair cracks appear moisture enters and the frost destroys it. Another fault referred to in this report is that of the cement striking out, which it ought not to do. Von Froideville also says that cement can be colored nicely and permanently with suitable colors, but quite a good deal of color is necessary if it is required to entirely hide the natural color of the cement and give it the exact color desired. It is to be borne in mind, however, that the addition of any coloring substance to cement tends to give it a softer and more friable character, so that there is required a comparatively larger quantity of cement than without color.

THE ORIGIN OF WATERSPOUTS.—What facts were noted of several waterspouts seen in the Pacific ocean have been examined by Mr. George Atwood, and he concludes as follows: The waterspouts on the Pacific were caused by a cloud heavily charged with cool moisture drifting from the high mountains of Costa Rica coming into contact with air currents and clouds traveling in a different direction and of a warmer temperature, by which contact the clouds surcharged with aqueous vapor acquired a rotary motion, causing them to discharge a part of their moisture and make them assume a cylindrical form, which finally fell by its own gravity into the ocean.

THE production of rails of various descriptions in the United States last year was as follows: Bessemer steel, 1,438,155 tons: iron, 227,874 tons; open hearth steel, 22,765 tons; total, 1,688,794 tons. The corresponding production in 1882 was as follows: Bessemer steel, 1,330,302 tons; iron, 488,581 tons; open hearth steel, 25 217 tons: total, 1,844,100.

THE band-saw mill, says the *Wood Worker*, is evidently the mill of the future where valuable hard-woods are to be cut. Even now the novelty of this style of mill has almost worn off, and they are being set up in nearly every part of the country. That this mill is looked on as the coming mill is evidenced by the fact that there are not less than half a dozen prominent machinery builders who have recently brought them out, or are preparing to.

The product of a band-saw mill sells for a better price than the product of a circular saw; but it is not every person who can run a band saw for cutting logs. The man who successfully engineers a band mill is always capable of doing first-class work, and with the advantages his machine possesses over the circular mill for nice work, there is little wonder that his product sells for more. There is likely to be a loud call for competent band-saw millers within the next few years.

STOPPING ENGINES BY ELECTRICITY.—The Dundee *Advertiser*, in describing this new application of electricity, says: "The huge engine at Manhattan Works, working at from 600 to 700 horse power, and driving a fly-wheel of about 35 tons weight, formerly took two minutes to come to rest after the steam had been taken off. This apparatus has been fitted to it, and the ponderous engine is now brought up in 30 seconds. To see this powerful, majestic piece of machinery, the developer of power for a long range of works, almost immediately brought to a standstill by the mere touching of a button at the far end of the building, is an impressive illustration of the easy control of enormous force by wisely ordered arrangements. To mill-owners the utility of the apparatus will be evident." The device has been applied to the driving engines of several of the largest mills in Dundee.

THE BEST MATERIAL FOR JOISTS.—It is claimed by many builders that wood joists, encased in plaster, are proof against any ordinary fire, and for many reasons are much preferred by them to the ordinary regulation fire proof iron joists. Strips are attached to the joists, over these strips of iron are run, and on these the plaster is spread. The theory is that in any ordinary fire these joists thus treated will be fire proof, and only when the fire has reached such a fury that the building must go any way will they be affected. Here comes in one of the advantages claimed for them. When a building is being burned by a furious fire the iron joists expand and crush out the walls, and do other damage. The wood joists would simply be burned up without injuring the walls at all.—*Lumberman*.

ALUMINUM COATED IRON.—Dr. Gehring, of Landshut, has invented a very simple process of coating iron with aluminum, by which it may be cheaply rendered highly ornamental. He uses a Bunsen burner with a blast or a muffle, and is thus able to manufacture various objects of the durable metal for daily use, the coating of aluminum giving them a silver white luster. He also produces a gold luster or any other color, and even an enamel coating, all of which substances are said to adhere very firmly to aluminum. Aluminum, like tin, does not oxidize under normal conditions, and even stands the heat of an ordinary fire, while it is much more lustrous than tin.

A NEW WOOD SCREW was recently described by Mr. Geo. Barnham, Jr., at a meeting of the Philadelphia Engineering Club, in which the thread, instead of being cut, is formed by pressure, the blank being passed through a series of rolling dies. The first set of dies forms a slight ridge, the second deepens the depression, and so on until the screw is perfectly formed. The point of the screw is left conical, without any thread, thus differing from the ordinary wooden screw, so that, in soft woods, it may be driven part way home before using the screw-driver, as is now done with most iron screws. Screws of all the larger sizes and bolts are made in this way. The thread is said to be as perfect to the eye as a cut wood-screw, and much stronger.

WASTING OIL.—One difficulty with tyros in the use of machinery is the wasting of oil by its to profuse use. It often happens that a bearing will heat when supplied with too much oil that will run cool when supplied with the proper quantity. The reason is that when the lubricator is partly worn it becomes sticky: it resists removal; it remains tenaciously between the shaft and its bearings; whereas too much of it, usually thin and limpid, serves to "wash the bearing," and let the part into closer contact.

PULLEYS.—*The Wood Worker* says: Our cast iron pulleys are much lighter than formerly, and latterly, wrought iron pulleys have been introduced, having in addition to the advantages of being already balanced and being stronger than cast pulleys, that of being very much lighter. Wooden pulleys of very neat construction have been placed on the market, and paper has also been pressed into service as pulleys.

MARBLE VENEERS.—Another substitute for wood finishing in the line of veneers has made its appearance. A patent marble veneer company has been formed in New York City for the manufacture of pliable veneers, that perfectly imitate marble or any variety of wood, and can be applied to any surface, no matter how irregular. The advantages are apparent. It is predicted that it has a profitable and possibly brilliant future.

SCIENTIFIC PROGRESS.

Progress of Electric Science.

Speaking of the work of the electricity division, and the recent marvelous development of electrical inventions, Mr. E. M. Bentley, one of the examiners of the electrical division of the Patent Office, gives some very suggestive facts. He says that about two thousand applications for patents in electricity were filed in 1882, of which about two-thirds were granted. To show how the subject has grown in importance within a few years, he said that in 1877 electricity was a sub-class in a division. Now it is the largest division in the Office, and regarded as the most important. The astonishing growth is due chiefly to two causes: First, the invention of the telephone; and, second, the development of the magneto-electrical machine. The telephone had opened, directly or indirectly, a wide field of inventions. The minds of many persons throughout this country were turned to this class of invention, and not only were improvements upon the telephone itself attempted, but attention was given to a great many incidental appliances useful in its successful application.

The second great stimulus to invention was the development of the magneto-electrical machine. For thirty years the world has been awaiting a cheap and convenient source of electricity. Immediately following the discoveries of Faraday and others, from 1830 to 1840, there was a wide spread effort to make practical use of them, and special activity was manifested in the lines of electric lighting. The arc light was put into practical form, and the foundations of incandescent lighting were laid. But no economic source of electricity was at hand; for the galvanic battery consumed too much zinc for profit. The principle of the magneto-electric machine had, indeed, been long known: but it was left for the Italian, Pacinotti, in 1860, to perfect a machine wherein continuous and constant currents were generated. The idea literally lay on the shelf, however, until 1870, when Gramme re-invented practically the same machine, and pushed it into notice. He was speedily followed by the Siemens brothers, of Berlin, and by Mr Brush and others in the United States. The magneto-electric machine, affording a cheap and abundant supply of electricity, immediately rendered practical all the half completed inventions of thirty years, and opened the way to many new ones. Brush got his patent in 1877, Weston soon after, and the growth of the electricity division of the Patent Office has been steady and marvelous ever since. The invention had been, however, rather in the application of known principles than in the discovery of new ones; for during the fifty years that have elapsed since the investigations of Faraday, little new has been added to the science of electricity. The present activity springs from the application of well known exhibitions of the still unknown force; and moreover, only a few of these features of the science have been as yet made of practical value. One of the broadest and most successful patents appears to be the telephone.

Absorption of Oxygen by Iron Cement.

In the construction of a railway bridge over the Forth, a number of cylinders were sunk into the bed of the river. They were built of iron rings six feet in diameter and several feet high, and made a total hight of sixty feet. The space round the sections was filled up from the inside by a rusting composition of iron turnings mixed with sulphur and sal ammoniac. When wet, this mixture oxidizes and swells up, so as to fill the spaces into which it is thrust. It was applied to the joints by one man. One day last May, however, when there was a perfectly still, somewhat hazy atmosphere, and considerable heat without direct sunshine, this man was observed to become overpowered by some "mysterious influence," and a companion descended by a windlass to bring him up to the top of the cylinder. He managed to get the man into the bucket of the windlass, and so to get him hauled up into purer air; but the deliverer himself succumbed to the same influence, and falling into a pool of water at the bottom of the cylinder was unfortunately drowned. One of the contractors now descended, taking care, however, to fasten a rope to his body, and it was fortunate he did so, as he also succumbed and had to be pulled out by the rope. Dr. Wallace was called in to account for this fatal accident and traced it to the absorption of oxygen by the rusting compound, thus depriving the air in the cylinder of its sustaining power. The oxygen combined with the iron and sulphur of the mixture, and the state of the atmosphere prevented free circulation of fresh air into the cylinder. The result was that the gas breathed by the man was nitrogen, or air robbed of its oxygen. The normal proportion of that gas in the air is 20.9 or 21 per cent, and Dr. Augus Smith has shown that this proportion cannot be altered, even by one quarter per cent, without producing appreciable effects, while a loss of one half per cent gives rise to serious inconvenience, and air containing only twenty per cent of oxygen may produce grave consequences if breathed for a considerable time. When the deficiency of oxygen exceeds this to a sensible extent, a candle refuses to burn.

THE RADIATION OF SILVER IN SOLIDIFYING.—At the International Congress of Electricians in 1881, M. J. Violle proposed, and M. Dumas, the famous chemist seconded, the use of an absolute unit of light consisting of the radiation emitted by a square centimetre of platinum in melting. At the instance of M. Cochery, the French Minister of posts and telegraphs, an investigation of the subject has been begun by M. Violle, and his first experiments have led him to some observations on the raidation of silver in solidifying. A bath of pure melted silver was placed under a thermo-eletric pile connected with a mirror galvanometer. The radiation from the bath fell normally on the battery through an aperture in a double-walled screen kept cool by circulating water. As the bath cooled the pile showed that the radiation slowly decreased until the instant just before solidifying, when there was a light increase preceding the final decrease after solidification.

TO DETERMINE THE HEATING POWER OF COAL.—In determining the heating power of coal and other combustibles, an apparatus is now employed, consisting of a cylindrical vessel of copper, punctured below with numerous small holes, and to the top of which is attached a hollow tube of the same material, closed with a stop cock; a small vessel of the same form to contain the materials, and a basal piece in which to fit it. In practice, a weighed portion of the finely powdered combustible, is intimately mixed in the mortar with a certain quantity of nitrate and chlorate of potassa, and this mixture is next placed in the small copper cylinder, and ignited with a fuse of known dimensions. Before the combustion takes place, the outer cylinder is slid down over it, being held there by springs attached to the basal piece, the whole contrivance being then plunged into a vessel containing a quantity of water of known temperature. The combustion soon sets in, continuing with vigor until the material has burned completely out. The instant the combustion has ceased, the stop cock in the tube is turned, and the water allowed to enter the air chamber, to cool down the heated interior; the temperature of the water is now observed. From these data it is easy to calculate the results, making allowance for the slight loss occasioned by the impossibility of bringing the apparatus back to its first temperature—owing to the increased temperature of the water—and the very small losses by radiation and conduction.

BY THE following simple method, plates for telephones and microphones may be made of any thickness: One or more plates of the desired shape and size are cut out of a piece of sheet iron. After dressing, rub them well on both sides with a dry cloth. This is essential to obtain an equal thickness, as otherwise the greasy spots left by handling would prevent a uniform action of the acid. It is better, also, to treat only one plate at a time. After wiping the plate well, it is plunged vertically, so as to be submerged in a bath of azotic acid. Acid that has been used several times in a Bunsen battery can be used, or else the azotic acid of commerce, with the addition of one fourth of water. The plate must be taken out frequently to ascertain the thickness. When the proper thickness is obtained, the plate is well washed in water, until the coating of blackish rust or oxide has completely disappeared; it is then let dry and one or more coatings of black Japanese varnish given on both sides to prevent oxidation. In this way plates may be obtained as thin as desired, and of all shapes and sizes. When membranes are used in microphones this is no slight advantage. *La Nature*.

SINGULAR EXPLOSIONS.—A singular accident and one of a somewhat alarming character recently occurred at one of the ironworks establishments in Middlesboro, England. A large slag ball was taken from one of the furnaces and tipped over upon the slag heap when it instantly exploded. Three large pieces of the half molten slag were thrown high into the air, and, in falling, crushed through the roof of the railway station near by, falling in the immediate vicinity of several passengers waiting for the train. The query naturally arose—how was the explosion produced? Another equally singular explosion is reported as having recently occurred at Lancaster, Texas, where a bin containing about 3,000 bushels of cotton seed recently exploded, as supposed, from the generation of gases.

TO REMOVE THE ODOR FROM PETROLEUM.—The disagreeable odor from petroleum or benzine may be removed, according to F. Grazer, by allowing it to percolate through animal or wood charcoal, or by treating it with sodium carbonate or lead carbonate. Another plan, which is recommended, is to employ a solution of bichromate of potassa, acidified with sulphuric acid, with which the benzine is agitated. A subsequent washing with water is necessary. A simpler plan than any of the above, that we recall having seen recommended, is to agitate the benzine with milk of lime, freshly prepared, which is reported to be very effectual.

ORIGIN OF THE UNIVERSE.—The well known Parisian editor, M. Moigno, has written a paper on the synthesis of the heavens and the earth. In this he makes the deduction that everything originated from ether, which first generated hydrogen. To an impulsation of ether he attributes the existence throughout the universe of the action of gravitation.

Bullion Shipments.

Hanauer, June 25th, $3,500; Ontario, 25th, $1,526; Horn Silver, 25th, $9,000; Hanauer, 28th, $3,850; Horn Silver, 27th, $18,000; Ontario, 28th, $4,447; Horn Silver, 28th, $9,000; Hanauer, 30th, $2,020; Crescent, 30th, $3,775; Ontario, 30th, $8,233; Horn Silver, 30th, $9,500.

A LIVELY CAMP.—The Leadville mines employ 3,250 men, and the pay rolls aggregate $280,000 per month. Leadville has produced $7,557,000 in gold, and $70,000,000 in gold, silver and lead up to the present time, while the incorporated mining companies of that city have paid stockholders in dividends within the past four years nearly $20,000,000.

NEGOTIATIONS between France and China have been difficult and unfavorable but have not been broken off.

Mining Share Market.

Mining stocks have been dull. The abandonment of business at the Board, for the few holidays, has of course had the usual effect. The *Enterprise* says that prices have generally gone down by slow stages, as the faith of holders and north-end stocks has oozed out during the progress of the west crosscut on the 3000 level toward the point where it was expected would be cut the ore vein found on the 2900 level. Many have arrived at the conclusion that the streaks of quartz already cut where the continuation of the vein found above, or that said vein does not come down to the 3000 level. Others, however, in view of the fact that no clay wall has yet been cut or water tapped, have faith that the vein looked for is still ahead. The foundation for this faith is the fact that the west wall of the ore vein when last seen on the 2900 level was slightly inclined to the west. Supposing, however, that its general course should be vertical, there is still room for a considerable body of ore against it. The east wall must have changed its dip, and assumed a more vertical position than it had above in the Union gound, or something would have been seen of it. We know that the dip of said wall was much steeper in the Sierra Nevada than in the Union ground, and as the whole chimney or deposit was making toward the south this dip would be likely to be carried to about where the crosscut is being run on the 3000 level. Broken in two by the occurrence of our national holiday, neither fraction of the current week, showed much vivacity in mining shares. On the opening of the Board, Thursday morning after a recess of four days, the report that the Union Con. crosscut had developed some good ore obtaining, that stock was advanced $100 per share over Saturday's prices; whereby, the bulls were a good deal elated. That such a trifling advance should have created such a stir shows the low estate to which this business has fallen; nor would there be much to regret did this incident presage its early extinction. With this shrinkage of business the attendance at the Board has been light. The din and clamor of the olden time has nearly subsided, while the army of stock dabblers that once swarmed about the Exchanges, or loitered in Pauper alley, has dwindled to a mere Corporal's guard. The manipulator of deals will be obliged to open up somewhere, another bonanza, or he will in a short time find his occupation clean gone. Mere prospects and favorable reports will fail to keep life in the market much longer.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

JACKSON.—*Ledger*, June 30:—The prospects of this property developing into a profitable mine have materially improved of late. In upraising a body of ore from three to five feet in width has been encountered, which prospects big, much of the rock showing free gold. From 40 to 50 tons of milling ore lies on the dump. Two gentlemen from San Francisco prominently identified with the enterprise came up Wednesday night on business.

PACIFIC.—In reply to an inquiry by the editor of the New York *Mining Record*, we will say that the Pacific Company has absorbed the Empire, according to good authority, in this way: In a suit for damages brought by the Pacific against the Empire some three years ago, the plaintiff recovered judgment for $75,000. The general opinion is that in satisfaction of this judgment the managers of the Empire have voluntarily surrendered the property to the Pacific, although we are not aware that any formal transfer has been made.

MAMMOTH.—The air-compressor for the tunneling operations on this claim arrived in Jackson Thursday evening, and proceeded to the mine early this (Friday) morning. It is from the Marysville foundry, and made to operate two drills. The drills have not arrived. It will take two or three weeks to get all the machinery in position ready for actual tunneling.

IMPORTANT CONSOLIDATION.—A document embracing some 40 pages of printed matter has been filed with the County Clerk for recording. It consists of articles of agreement and consolidation of the Pacific, Empire and Plymouth mines, of Plymouth, under the name of the Plymouth Consolidated Gold Mining Company. The capital stock is $5,000,000, divided into 100,000 shares of $50 each. The Plymouth mine, adjoins the Pacific on the east. This consolidation is probably the final outcome of the long standing litigation between the Empire and Pacific mines.

MISCELLANEOUS.—The Seaton Company are vigorously prospecting the Maryland claim, adjoining the Seaton, and which was recently purchased by the Seaton Company.

Butte.

GOLD DUST.—*Record*, June 30: To-day a Butte creek miner came to town, and deposited something over two thousand dollars' worth of gold dust in the bank of Butte county. This deposit was the result of a month's clean-up. The miner reported everything quiet along the creek, only a few of the claims being worked. "The miner" wisely objects to having his name mentioned in this paper, fearing that foot-pads may lay for him sometime.

El Dorado.

THE MELTON MINE.—*Mountain Democrat*, June 30: H. H. McClelland, Superintendent of the Melton mine, Grizzly Flat District, was in town Tuesday and Wednesday. The improvements in his mill have been completed, and he started up his fifteen stamps last Monday. He is working four levels, each, except the lower one of course, 100 feet above another; putting through the mill all that comes out and realizing a satisfactory and very respectable average.

GREENWOOD.—Georgetown *Gazette*, June 30: Mr. A. J. Morrell, President of the Morrell Con. Gold M. Co., has been in Greenwood during the past week busily engaged in arranging details for exploring the Co.'s mines on the Cedarberg belt. The 6-stamp mill, which is a circular battery for prospecting purposes, weighing all 30 cwt., is now on the ground and will shortly be put in place, and will then be used for reducing the vein matter extracted, many portions of which show free gold. Mr. Morrell proposes to apply a small donkey engine for running the mill. Mr. Easton the superintendent arrived with Mr. Morrell, and with Mrs. Easton and their little daughter are a very agreeable addition to our population, and will we hope make a long and prosperous stay in Greenwood. Judge Swift was also of the party, a gentleman whose legal experience and acumen is only equaled by his practical knowledge of mines and mining. Commencing with California in '49 the Judge has since then owned, worked and experted mines in Australia, Colorado, Arizona, Mexico, South America and other places that he has visited, not simply as a tourist, but as a practical miner, reducing theory to practice. We hope to see Judge Swift again in this section, and that he will then be able to more thoroughly examine our mining opportunities. The new Eureka ledge continues to improve in development. Mr. Cheek has uncovered the ledge about 100 ft south of the first prospect shaft and finds the lode in no way inferior, it being more than 10 ft in width and pr specting from wall to wall in a good showing of free gold. Mr. Check is now sinking for this lode some 200 ft to the north, and by another week we hope to report the discovery of the lode at this point. The carpenters are pushing ahead vigorously on the new mill building. The mill and machinery are now at Auburn station, and will be here in a few days.

Mariposa.

A GOOD MINE.—*Herald, June 29*: We are glad to know that the mine owned by Louis Repetto and Alex. Bogliolo, on a branch of Maxwell's creek about five miles from Coulterville, furnishes promising prospects. The lode is about three or four feet in width, and produces some fine gold-bearing quartz. A section of four or five inches on the vein is very rich in free gold. Some specimens we have seen were simply superb. The quartz is very brittle and therefore of easy milling grade.

Mono.

STANDARD CON.—Bodie *Free Press* June 28: There were extracted and shipped to the mills during the past week 1475 tons of ore. The bullion shipment was valued at $32,334.47. The west crosscut 1200 level, has been advanced during the week 19 ft; total length, 320 ft. South drift No. 2 has been advanced 19 ft; and it is now 13 ft. The vein at this point is about 5 ft wide.

BODIE CON.—During the past week there were 131,885 tons of ore hauled to the mill, and 174,240 were crushed. The average value of the pulp was $28.92 per ton; that of the tailings $6.02. There were 218 car-loads of ore hoisted from the mine. At the 1000 level the west crosscut was driven 11 ft; total length 275 ft.

BULWER CON.—The west crosscut from the north drift 700 level, has been advanced during the week 15 ft; total length, 304 ft. The ground continues hard.

Plumas.

CRESCENT MINE.—Greenville *Bulletin*, June 27: At the Crescent mine all work, other than pumping, is for the present suspended. Mr. Chapman, one of the owners, spent some days at the mine last week. He publicly expressed himself highly satisfied with all that Mr. Davis has done. He has since returned to San Francisco, and will make such report to his partners as will govern their future actions.

GREEN MOUNTAIN.—No new developments yet to report in the big tunnel, the drift goes ahead rapidly and steadily, the ledge does not yet prospect enough to warrant milling any of the ore, but is of such character as to justify belief that pay will soon be reached. In the meantime ore enough is taken from the upper tunnels to keep both mills fully supplied.

PLUMAS CON.—Nothing at all is being done at the Plumas Con. A contract was let some months ago for an extension of the main tunnel; this contract was finished some time ago, leaving the face in solid granite, where it still rests, and is likely to.

GOLD STRIPE.—On last Wednesday the mill was started up, but will be kept running day shift only for some time. Some prospecting is kept up, and upon the result of this, future operations will depend.

Shasta.

SOUTH FORK.—Cor. *Shasta Courier*, June 30: Robinson & Co.'s arastra is running as usual. The mine looks well and is yielding some fine silver ore in addition to the decomposed gold bearing ore.

J. B. Strong is mining and having a run of ore put through E. L. Ballou's arastra.

Wright & Ormsby are getting good ore and expect to make a good run.

Crum's arastra is idle now but will start as soon as they can get some ore down from the mine.

The Manzanita is yielding as well as ever.

Smith & Cooper's arastra is running and their mine yielding as usual.

Water is abundant at present, but gradually failing.

Trinity.

A REGULAR BONANZA.—Trinity *Journal*, June 30: While at Bolt's Hill on Sunday last we had the pleasure of meeting Mr. T. J. Blakemore, and from him learned that the recent quartz discovery made by "Uncle Jim" Blackmore near Eastman Gulch, was turning out much better than had at first been anticipated. Sixteen and one-half tons of the rock ground in the arastra produced $2,500, or at the rate of $150 to the ton, and the rock which they are now running is variously estimated at from $200 to $400 to the ton. The lode has well defined walls, and widens and improves as they go down on it. Under these conditions, it is not surprising that the Blakemores last week refused $50,000 for their mine, the offer being made by a justly celebrated quartz mining expert from San Francisco. The Hickey mine, in the same district, continues to pay largely, and with every indication of permanence. Much prospecting is now being done in that vicinity, and in several instances splendid prospects have been found.

BULLYHOOP.—The development tunnel on the south end of the Mammoth is being pushed vigorously, working three shifts night and day. Length of tunnel at date is 165 feet. According to estimates, 20 feet further will strike the ledge, showing the vein at the depth of 185 feet. If the showing proves as good as the surface prospects, our camp is made. The Bullychoop Co. are cleaning out the old shaft on the ridge. This shaft yielded upwards of $6,000, but on account of bad management was allowed to cave, and the work on the tunnel was prosecuted in view of tapping the chute from below. The Davis Bros. are fitting up their mill, and expect to take out rock from the old workings as soon as the water lowers. Thomson has opened a new drift south in his upper shaft, showing some very fine rock and widening fast in the face. The Cumberland Co. are getting encouraging prospects. The ledge is the first north extension of the Mammoth, and bids fair to rival it in size and richness. The property is in the hands of a company of Red Bluff men, who intend to test its merits for themselves.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, June 30: The winze on the 2600 level is down little over 40 feet. Streaks of ore that assays well are still being found at the bottom of the winze. These are supposed to be feeders of a large ore deposit lying further to the west. The water winze on the 2400 level down to the top of the 2500 station. They now have between 700 and 800 feet of drifts to drain.

UNION CON.—The south lateral drift on the 2700 level is being overhauled and retimbered. The joint Sierra Nevada cross-cut on the 3,000 level is out 73 ft from the winze. The face was yesterday in hard, green porphyry. There is no water coming in. The rock does not break well in blasting, and rapid progress cannot be made. The ore vein cut on the 2900 level is supposed to be farther ahead.

OPHIR. Very good progress is being made in cleaning out and repairing the old Central tunnel, but in some places it is found to be badly caved. Are also repairing the ladders and track in the main ineline. Ore is still being regularly extracted from the croppings. The yield of ore from the old upper works will be greatly increased upon the completion of the repairs to the old Central tunnel.

SIERRA NEVADA.—Thus far no sign has been seen of the ore vein found on the 2900 level.

SAVAGE.—No work is being done in the mine at present, nor can any explorations be economically made until the Hale & Norcross winze connects the 2400 and 2600 levels, and gives a free natural circulation of air upon which to draw.

CALIFORNIA.—The C. and C. winze is being sunk at the rate of about 10 feet per week. The south drift on the 2500 level is making the usual progress.

BEST AND BELCHER.—The northeast drift on the 2500 level is being advanced at the rate of about 25 feet per week. It is still in vein porphyry, and is out over 425 feet.

MEXICAN.—On the 2700 level are cleaning out the drain in the west cross-cut. The main north

lateral drift on the 3100 level is being driven ahead as rapidly as possible.

NORTH GOULD AND CURRY.—The bottom of the shaft is still in rock that shows stringers of quartz and seams of clay. The predominating rock is vein porphyry.

SCORPION. The usual progress is making in the west drift on the 500 level. There is no water, and the material remains unchanged.

ALTA. Rapid progress is being made in the drain drift to connect with the Sutro tunnel. Work is being pushed at both ends of the drift.

ANDES. The prospecting sections show some quartz of fine appearance, and some paying ore is still being extracted.

GOULD AND CURRY. On the 2500 level west cross cut No. 2 is making good progress in vein material of a favorable appearance.

YELLOW JACKET. Are taking out about 150 tons of ore per day at the Winters shaft. Are still re-opening old drift and stopes.

Aurum District.

FINE PROSPECT.—White Pine *News*, June 30: Judge Stearns, who has returned from Aurum, informs us that the people over there are highly elated over the prospects in the mines of that district. Very flattering developments have lately been made in the Blue Bell mine. The Judge saw some of the ore, which he pronounces first-class, and they say they have lots of it. We are pleased to note this encouraging sign of prosperity among our neighbors. Dr. Brooks and Mr. Mikel deserve success. They have worked hard to acquire such a result. May their sanguine hope be realized.

Columbus District.

NORTHERN BELLE.—*True Fissure*, June 30: There has been very little change in the appearance of the mine since last week. A large amount of prospecting is being done in all directions, the same being pushed ahead as rapidly as possible. The southwest drift on the fifth shaft level has been extended 10 ft; its total length is 133 ft. The ground in the face of this drift has become much softer within the past two days. The crosscut to the south has been advanced 11 ft in the same formation as last reported. The total distance run to date is 117 ft. Owing to the extreme heat in the face of the main drift on the fourth shaft level, eight shifts of men are now doing the work. The stopes on this level are producing the usual quantity of ore. Both mills are running steadily and doing good work. The crushing for the Great Western mine has been completed, and mill No. 2 is now engaged entirely upon the company's ore. The bullion shipments amounted to $14,161.25 for the week ending June 28th, and aggregate $41,778.69 on June account to the same date.

MOUNT DIABLO.—The stope near winze No. 1 is turning out a little $50 ore. The stope east of lower winze No. 2, shows some 2 ft of $70 ore, while the intermediate drift, between the second and third levels, nearly above winze No. 1, is yielding some $150 ore, from an 18-inch streak that carries some waste. The stope above the west drift from the Callison winze is looking well and turning out more ore than a week ago. The ledge will average fully 3 ft in width for a length of 100 ft, the grade of the ore being something over $100 per ton. A shipment of bullion valued at $3,959.72 was made June 21st, and one of $9,286.10 June 25th.

Mount Cory District.

MILL AND MINE.—Esmeralda *Herald*, June 30: The new mill for the Mt. Cory mine will be built after the pattern of the Geddes and Bertrand mill, close to Eureka. It will consist of a revolving crusher and a Brockner furnace, and will have a capacity of 80 tons every 24 hours. It is to be completed by the first of September, and will cost $150,000. The Mt. Cory mine is jointly owned by J. C. Flood, J. L. Flood, George R. Wells and Alexander G. McKenzie. The company is a strong one, and will undoubtedly soon bring their property—which promises well—to the front as one of the leading bullion producers of the country.

Northumberland District.

LOOKING WELL.—Belmont *Courier*, June 28: Mr. George, of Northumberland, was in Belmont on Monday. He reports that the mines in that district are looking tiptop. There is considerable ore on the dumps, and good bodies of it in sight in the mines. The mill will start up about the 1st of next month, when bullion shipments will be in order.

YIELDING.—Belmont *Courier*, June 30: It is expected that the Northumberland mill will start up on ores from that district some day next week. The mines are yielding the usual quantity of good ore.

Pioche District.

MEADOW VALLEY.—Pioche *Record*, June 26; On Wednesday we were up at the Meadow Valley mine taking a look at what is called the "new strike," and in company with Supt. Duff we entered the mine. The strike was made in the old Fitzhugh tunnel, and is in a distance of 600 ft from the entrance of the tunnel on Meadow Valley street. The ledge has been sunk on about six ft from the bottom of the tunnel, and is nearly four ft in width from wall to wall at the place where work was then being done. Some five tons of this ore was sent to Dry Valley mill, and the pulp assay went $44 in silver and $6 in gold, the total pulp assay being $50. This discovery is nothing new. The workings of the mine shows this. The ore above this point was all extracted years ago. The ore had all been extracted down to the tunnel level in early days, then it becoming of low grade, it was abandoned, very probably because in those days $50 ore would not pay. It is simply the continuation of the ledge, where work had been left off. In the tunnel level, on the ledge, several winzes have been sunk by chloriders, who finally abandoned them. In some of the winzes the ore is said to go from $50 to $80, at the bottom. At the present time $50 ore will pay a company a handsome profit.

Reveille District.

GOOD ORE.—Belmont *Courier*, June 30: Work progresses satisfactory in the mines at Reveille. Good ore is encountered daily. The weather is said to be very warm in that district.

Safford District.

ANOTHER STRIKE.—Virginia *Enterprise*, June 28: It is now reported that a good strike was made last Saturday in the Good Luck mine, Safford district. A streak of ore has been found that is four ft thick, which assays several hundred dollars per ton. Samples of the ore which were brought from the mine look as if they had been burned black, but flakes of horn silver could be seen all through them. The gangue is not quartz, but black spar, which gives the ore a burned appearance.

Schroeder District.

THE NEW DISTRICT.—Safford *Express*, The new mining district lately discovered by C. E. Ferguson of our village is situated in this county, 13 miles north of the C. P. Railroads, and known as Schroeder District. Rich deposit of copper ore and nickel have been discovered, besides lead carbonates assaying high in silver. The ores resemble those of Eureka, and are similar to them to a great extent. The principal mines now located are the Pride of Nevada, Chicago and Sandy Jim, which are being now operated by a Chicago firm.

Silver Point District.

DEVELOPMENT.—Belmont *Courier*, June 30. The work of development goes bravely on in the mines at Silver Point, and the ore from that district is being hauled to the Jefferson mill for reduction.

Tuscarora District.

TUNNEL.—*Times-Review*, June 28: The contract for running an additional 50 ft in the Tuscarora tunnel has been completed. The formation in the face of the tunnel is undergoing a change, the rock becoming harder and more regular, with considerable moisture, all of which are regarded as favorable indications. Another contract is to be let soon.

Tybo District.

MILL START.—Belmont *Courier*, June 30: The Tybo mill will soon start up on company's ore, and a long profitable run is confidently expected.

Ward District

THE MARTIN WHITE.—Ward *Reflex*, June 29: Some wonderfully rich ore was struck in the Martin White mine north of the old whim shaft Wednesday last. Some pieces are nearly all horn silver, and as malleable as lead. One chunk of this character was taken out that weighs 35 pounds. Two wagon-loads of ore, in sacks, supposed to be worth several thousands dollars to the ton, have been taken to the company's office, it being considered too rich to leave at the mill at present. Don't all get excited at once. It is not all of the above character by any means. Where the work is going on, under the old croppings, not to exceed 15 ft from the surface, there is considerable ore in the face, but little is known about its extent. The ledge matter here is fully 25 ft wide. It was in this portion of the mine that the large and rich body of ore was struck that first attracted attention to Ward, and that has not been touched worth speaking of for a number of years.

A NEW DISCOVERY.—Safford *Express*, June 30: On Saturday last an important strike was made in the Good Luck shaft at Safford at a depth of about 25 ft from the surface. There was encountered a streak of ore fully four ft wide, assaying several hundred dollars per ton. Samples of the ore look as though they had been burned black, and is similar in a great many respects to the Onondaga ore. Flakes of horn silver are visible throughout the rock, which, being black spar, gives the ore a burned appearance. The ledge has widened considerable during the week and now appears to be a permanent thing. The owners are highly elated over the find, and propose continuing the work in order to assertain if "she goes down" a fact which will be welcomed by our community.

Washington District.

BIRDIE.—Grantsville *Bonanza*, June 30: We are informed that a rich strike has been made in the Birdie mine, which is located in San Juan canyon, Washington district, Nye county. This property is owned by Matsy Merton and R. W. Scott. There are several valuable mines in this district but very little work is being done on any of them at present.

ARIZONA.

JOTTINGS.—Prescott *Courier*, June 28: A. A. Alexander, superintendent of the Black Warrior mill and mine, arrived in Prescott Sunday night last, with two and one-half bars of fine silver bullion. The Howell Co. are making a great deal of bullion. The mill site will soon be graded. Copper mountain smelter not running. Three shifts are taking ore from the mine, Saturday last, the shaft in the Gavin mine was down 20 ft; vein strong and rich. Rumor hath it that Mr. McDonald recently found a rich deposit near that of Gavin & Co's. News from Trainor's camp, Turkey creek district, is encouraging. Lodes yielding well; smelter about ready for operations. Mr. Merrington has received a concentrator, for service at his Groom creek mill.

COLORADO.

NOTES.—Georgetown *Courier*, June 30: The Wallace is producing two tons of 300-ounce ore daily. The Eclipse is shipping about 15 tons of ore per month which mills nearly 300 ounces per ton. An air compressor is to be put in the Lehanon Tunnel. It will be operated by water power, and used in place of steam in mining operations. An air compressor has been put in place to run the drills on the Mendota tunnel in place of steam. The tunnel heading is now in over 125 ft. A chunk of ore about 20 inches thick, four ft wide and five ft long, was shot down last week in the Hennessy & Shay lease on the Mendota. A three inch vein of 300 ounce ore has been encountered in the Saxon Extension. The property is being worked under lease by Mr. R. Root. A vein of wire gold one-fourth of an inch thick, was struck at a depth of 34 ft in the Tariff lode, Ute creek, last week. The vein also shows 14 inches of quartz impregnated with free gold. The lucky owner is S. J. Kennedy. From a new discovery of Comstock & Lawrence, on Ute creek, specimens of free gold were taken at a depth of seven ft, valued at $150. The vein has also shown from grass roots a three-inch streak of ore assaying 180 ounces silver and one-half ounce gold per ton, and also another streak composed of galena, gray copper and zinc blende. The surprise that an assay gives one sometimes from barren looking lode matter, was illustrated a few days since, by the assay of quartz showing no mineral, from the High Line lode, on Griffith mountain, which gave a result of four ounces gold per ton. Mr. Colburn has been extracting some very fine ore from this lode recently, which mills 192 ounces silver per ton. Last week we mentioned the finding of good ore at the surface of the Sonora, on Griffith mountain. During the past week, work has developed nearly nine inches of solid ore that will probably mill in the neighborhood of 800 ounces per ton. Mr. Joseph Guanella, the owner of this property is justifiably enthusiastic over the prospect of a large pocket of high grade ore.

IDAHO.

CURTIS MILL.—Wood River *Times*, June 20: The mill of the Columbia and Beaver M. & M. Co. of Sawtooth will be started up in a few days, on custom ore, of which there are several hundred tons at the Pilgrim, Columbia and Beaver, Silver King, and Bidwell mine dumps. The mill men intend to charge $35 a ton for reduction, and will guarantee a yield of 90 %.

THE ALLEN GROUP SOLD.—Connor & McGregor yesterday purchased and paid the cash for the Allen group of mines on Warm Springs creek.

AN IMPORTANT STRIKE.—This morning news came in of an important strike in the Red Cloud mine, located on the south fork of Deer creek, and owned by A. L. Mason and the Porter brothers, of Bullion. While stripping the ledge on the surface, yesterday, they cut through a vein of high grade silver galena, from two to three ft wide. The Red Cloud is near the great Chicago and Green Mountain Boy mines, and is regarded as on the same vein as the former. The Chicago, owned by James Mahana and Chicago parties, is being developed by an incline shaft, which is sunk on the foot-wall in quartzite. The vein is on the hanging wall, which is a lime formation, and the course of the vein is north and south. It is, therefore, a contact formation.

CHINESE MINERS.—Idaho *World*, June 26: The Chinese Co. that have been working Plowman's drifting ground (on the south side of East hill) on shares, cleaned up last Saturday. The cleanup was $6,000. They have been at work since last fall. Plowman furnishes water and tools. The Chinese get 70% of what comes out. The cleanup was larger than was expected. They have commenced work again in the drift.

THE BIG CAMAS.—Matthew Williams, with several miners, is now at work on the Big Camas mine. The Camas mine was started 18 years ago, when Indians roamed this section, has been run into the hill 430 feet, but as no vein was cut at that distance in, and as the owners wish to realize some returns from the property, work was resumed yesterday on the surface. The outcrop for a distance of 800 feet along the course of the vein is 30 feet wide, and thousands of tons can be broken down and actually quarried out from the surface, as in most places the croppings stand several feet above the ground. The company expect to build a double-bed arastra mill, to be run by horses, and will locate it in the gulch below the mine, where they have some 30 miners' inches of water. The croppings run an average of $15 to the ton, and the formation is soft rendering the extraction of the ore inexpensive,

ON THE EAST FORK.—M. J. Brockway came in Saturday from the East Fork of Wood River, where he has been examining the mines during 30 days past, as well as on the Middle Fork of Little Wood River. On the latter he has discovered an immense iron mine which, he states, is 22 ft wide of solid ore and of a finer quality than yet found in the country. He located this iron mine May 10, and has since that time had it examined by a number of experts. The ore contains but little silica, and can be quarried out so easily that all the smelters can be supplied with iron for fluxing. The Faro King and Wasatch are also promising locations near by.

THE IDAHOAN MINE.—Willian H. Nye will visit Hailey after July 4, to see the Idahoan mine. Judge Turner is shipping ten tons of ore a day from the mine now, and expects to have the machinery, concentrating works, etc., very soon. T. J. Edington, another of the owners, is now in Denver and may go to Chicago to secure the machinery, which will consist of a rock crusher, Cornish rollers, pigs and concentraters. The water ditch has been completed and is now ready for the machinery. Judge Turner says they will secure the best machinery made for the purpose and as soon as it is set all the second and third grade ore which has been left standing in the mine will be extracted and concentrated

SUMMARY OF NEWS.—Wood River *Miner*, June 30: From parties just in from beyond the Sawtooth range, it is learned that J. D. Murphy is opening up the Atlanta mine, at Sawtooth and having considerable high grade shipping ore extracted. The Columbia and Beaver Co. are getting ready to start their mill and are prepared to buy ores from the mines and from prospectors in any amount, paying cash down. The mill management charge $25 per ton for milling, and return 85 per cent of the assay value or buy the ore on that basis. The prospects for flush times and lively camps at Vienna and Sawtooth are 200 per cent brighter than last year at this time. The Nellie group in Smiley gulch, has been started up again, and five miners are now developing the property, and more are to be added as soon as there is room to work them. The Rosebud, on the South Boise river slope, is a new location owned by Julian Riley, and assays gives an average of the ore at 400 ounces of silver to the ton. The roads will be open soon around Vienna, or in about ten days, and then the mines well ship ore to the mill, which is about completed and will be ready to run by the time the ore is at hand. There has been deep snow on the grade between the mill and the mine, and the hauling of ore has been delayed on that account. The lower tunnel on the Mountain King mine has cut a body of ore stronger and of higher grade than at any point in the upper workings. The Vienna mine is showing up finely, and producing ore rapidly from the stopes and the management will ship to Johnson's mill as soon as it starts up. The 20 stamps can be kept running constantly the entire season on ore now extracted and in sight.

MONTANA.

GREGORY.—*Inter-Mountain*, June 29: On the 600 ft west drift the character of the product shows a great improvement over that extracted from the levels above, for the ore at that depth appears as a solid body of galena varying in width from 20 inches to 4 ft and sampling 80 ounces in silver, 60% lead, and $20 in gold. This remarkably rich streak is found on the hanging wall for a continuous length of 175 ft from the 600 ft station. The foot wall side of the ledge has not yet been explored, nor has its distance from the hanging wall been ascertained. The daily output is about 35 tons which will be very largely increased on the completion of a projected concentrator which will have a daily capacity of 100 tons. A new hoist with a capacity to sink 1,000 ft has been already ordered and will be started into operation as soon as possible. On the Fourth of July when the Northern Pacific railroad celebration shall take place in Helena, the Gregory Co. will add a glory and importance to the event by the shipment of 1,000,000 pounds of silver-lead bullion from its smelter—the accumulated product of a long and very successful run.

NEW MEXICO.

NOTES.—*Southwest Sentinel*, June 28: Wyman & Co., shipped a carload of Bald Mountain ore to Pueblo, last Thursday. The William Bros. are still drifting south on the Sherman, and the ore body continues to show up well. Thos. Hall sold the Mogul mine, Pinos Altos district, last Thursday, to Bell & Stevens. Consideration, $6,000. About 40 house are now completed at Fleming, and building is still going forward. Tents are gradually giving way to houses. The Ruby M. Co., is employing a heavy force of men at Lone mountain, and is rapidly developing a number of its mines. The company has 75,000 ft of lumber at the mill site, and it is thought the mill will be up and the machinery running before winter. Jack Frost is working his shaft on the Home Ticket, Lone Mountain district. He is now down about 75 ft in a fine body of ore. The Home Ticket has always yielded 200 and 300 ounces ore. It is one of the best mines in the district and its assays have run up to 800 ounces. Owens, Swancoat and Richards are working on the Champion mine, about three-quarters of a mile northeast of Camp Fleming. They are in granite and are down 15 ft on a clearly defined ledge some 18 inches wide. The ore assays from 400 to 600 ounces to the ton. T. M. Hall is working, or as he terms it, prospecting, the Alice and Carrie mines on the west slope of Pinos Altos mountain. On the Alice he is down 50 ft, sinking along a porphyry wall. The work is mostly in lead carbonates running from 20 to 30 ounces in silver. The Carrie is the adjoining and parallel claim, and shows heavy iron croppings. A shaft has been commenced at this lead and is now down about 20 ft. A splendid body of ore has recently been exposed on Houston & Thomas' Alpha and Omega mine near Pinos Altos. A cut 150 ft in length and averaging six ft in depth has been run along the vein or deposit of ore, and then the entire surface stripped a distance of 65 ft back from this cut and for fully 100 ft of its length. The enormous body of ore thus exposed is of precisely the same character as that shipped sometime since, and which by actual mill tests runs—first lot $23.40, and second lot $29.80 to the ton. Worked on the ground in a Mexican furnace, it yielded 27 ounces to the ton. F. C. Taylor having failed to meet the third payment of $20,000, on the Old Man mine at Camp Fleming, due on the 15th, his working bond was forfeited, and the property reverted to J. W. Fleming and his associates, the original locators. The owners are still pushing work on the mine, having let a contract last Wednesday for a shaft to be sunk 50 ft deep on the contract. June, one of the owners is now in Albuquerque, sampling ore shipped under the Taylor bond, for which no returns had been made at the expiration of contract, and which of course became the property of the original owners. Mr. Taylor gave an order for the same promptly upon the forfeiture of his bond. Upon June's return a full force will be put to work upon the mine.

TELEGRAPH DISTRICT.—Cor. *Southwest Sentinel*, June 30: The main incline on Mother lode has reached a depth of 105 ft. Ore body is six ft thick, of good milling ore. This ore body is still compact and shows no indications of weakening in quantity or quality. The ore samples about 35 ounces per ton. The drift at the 100 level running south is in 36 ft showing a thickness of six ft of 50 ounces free milling ore. The north drift on same level is in 31 ft showing six feet blanket ore, richer than that of the south drift. The main shaft on the Good Hope is now 41 ft deep and is being pushed as fast as possible. It is expected that this shaft will reach the ore contact at a depth of 75 or 80 ft. The shaft at south end of claim shows three ft of chloride ore, that will mill 18 ounces. A phenomenal strike of rich ore was made on the Tecumsch this week, in the discovery of the continuation of the Mother lode. The deposit has been stripped a distance of 120 ft. Average thickness from 5½ to 6 ft. This ore is very high grade, and will equal if not surpass any yet discovered on the Hill. The stripping is being pushed rapidly, and by another week an ore body will probably be exposed that for strength and richness has never before been found in the Territory.

AVERY.—At the 41 level the drift is in 11 ft, showing 4 ft vein of sulphuret ore that is probably the richest average ore in the camp. Carefully sampled from wall to wall it assayed 175 ounces. This is a fissure vein in granite, and the improvement in the results of the last week's work is something extraordinary. Mr. John T. Mitchell, under whose supervision this work is being carried forward, is confident that the ore bodies so far exposed give evidence of a strength and richness that will place this camp among the leading bullion producers of the Territory, when the reduction works soon to be erected are in operation. All the ore so far discovered in the principal mines is an absolutely free mill ore, and with the facilities that the camp affords for cheap reduction, can be milled as low as 8 ounces with a fair profit.

UTAH.

PARK CITY MINING NOTES.—Salt Lake *Tribune*, July 3: At the Disappointment mine the force of men has been increased and the first carload of ore will be shipped to-day. The Silver Key may now be considered a regular producer. This week three carloads of ore were shipped from this property. More will follow right along in regular order. Mr. Pearson is now engaged in making preparations to commence work on the Pioneer. He is fixing up his cabin and getting things in shape to put on a force of men and push the work of development ahead. White Pine canyon will be a lively place this summer and we hope rich lodes of ore will be uncovered there before snow flies next fall. There is some valuable lime rock in this region. A couple of prospectors, in working on a ledge this spring, uncovered a quality of rock which suited the fancy of a citizen of Salt Lake, and he unhesitatingly offered them $400 for the claim. The boys have the matter under advisement, but they are inclined to believe that farther on there is something more valuable than lime rock in their ledge,

High Prices for Prospects.

The following suggestive article is from the Butte, M. T., *Inter-Mountain*: Mr. F. Melvin Chadbourn, connected with the Mining Bureau of the London Mercantile Association, has been in Butte for the past month. During his visit here he has occupied himself in examining the silver and copper mines of Butte, and speaks in very favorable terms of their extent, richness and productiveness. It is understood that Mr. Chadbourn's object in coming here was to bond some good properties and place them in the London market. But the gentleman intends to leave on Thursday morning on his return to England, and learning that he had made no arrangements to bandle any of the Butte properties a reporter this morning stopped the gentleman on the street and inquired why he did not succeed in his mission, and why he proposed to go away so soon?

"Well," was the reply, "I had heard before coming here that there were many fine mining properties here possessing every favorable indication as to size and permanence, but still idle for lack of capital. They were many of them owned, I was informed, by poor men, who, fully aware of their own inability to work them, would give a liberal, or at least a reasonable 'layont' to any one to agree to develop them under lease and bond, and that the bond would not be placed at any exorbitant figure."

"What did you find on your arrival?"

"I found a part of the report to be strictly true. I found more promising prospects than I ever saw in any other ten mining camps I ever visited. I found forty, fifty and sixty foot shafts sunk on ledges of great promise—ledges with smooth, well-defined walls, regular dip, uniform width and fine veins of ore. Many of them are idle because the owners have no money to buy pumps and hoists or money to put up mills and smelters, or to take out ore and have it worked at the present custom rates. These properties, you should remember, are not mines but prospects, and in most of them not a pound of ore is in sight below water level except what the main shaft exposes. They may all be capable of very profitable development, and such is a reasonable presumption judging from the experience with other properties which have been opened. But English capital is no longer invested on merely presumptive evidence. That kind of business is played out long ago, as did many of the mines which were bought on a surface showing. The policy of mining investors has changed, and while they are still willing to pay a good price for a good property, one of ascertained value, they will pay nothing for properties which have not been opened and proved. We realize how difficult it is sometimes to purchase a developed mine and we are therefore willing to develop them provided that if they suit us we can have the option of purchasing them. But here an insuperable difficulty intervenes.

The prospector either demands a tremendously high cash price, or an enormous bond and a gigantic forfeit. We protest, and they say to us: 'your policy doesn't give us a square deal. You open our properties and take them if you are suited; if not, you throw up your bond, and we have on hand a worthless property, or else one with a very black eye. We take the chances and you get the money, if the mine proves a bonanza.' This kind of talk is what a man always gets when he wants to bond a mine, and unless he is willing to bond at five times the cash price, and pay a forfeit besides, if he does not take the property he is called a shark and looked upon as a speculating adventurer. This is an extreme injustice to the agents of capital, and unreasonable too. For instance, what honest man would sell a property at a high figure, which a little development would prove to be worthless; and, *per contra*, if a prospect owner has confidence in the extent and value of his mine, why should he refuse to bond it and have it developed? If it opens well, he gets what he was willing to sell for, cash down, and the bigger it is, the better for him, the purchaser and the district."

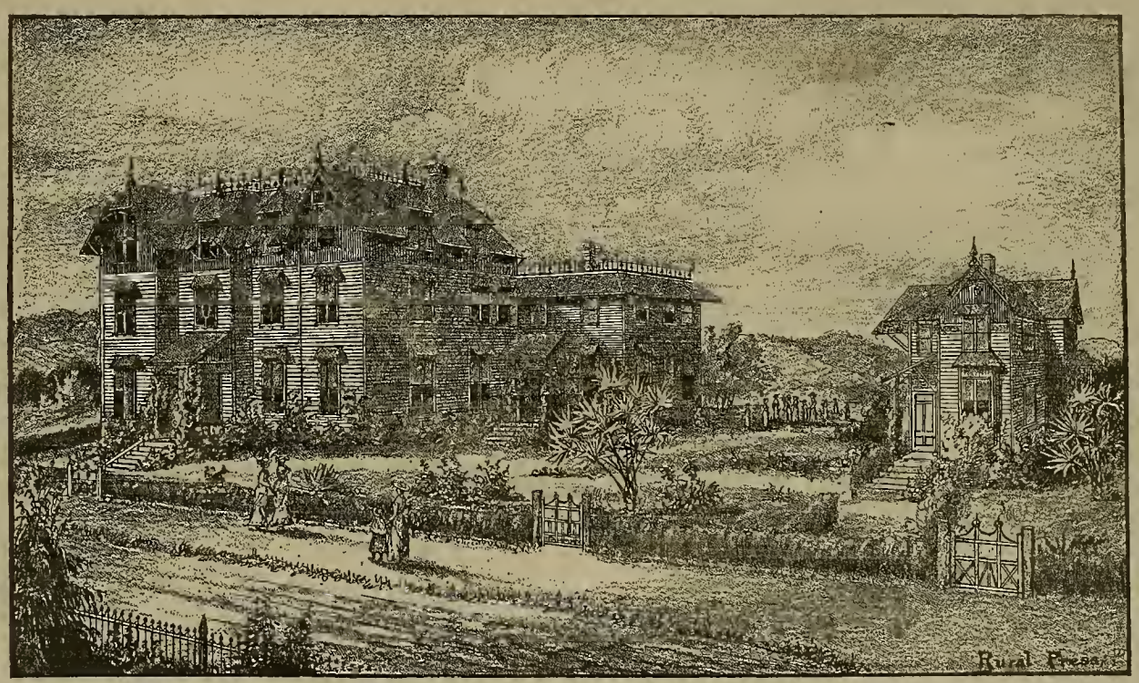
"Have you had any trouble such as that you speak of?"

"Yes. There are half a dozen properties here which I should very much like to bond, and they show well on the surface and look very promising. If I could get a reasonable bond I would develop them, and my impression is that they would open up well enough to justify me in negotiating their sale. But I cannot afford to take any chances. One man in particular came to me and offered a property that impressed me most favorably. It has been idle for four years, and is likely to be idle for four more. He would take $15,000 in cash, or bond it for 60 days for $50,000. I told him I would bond it for six months for $25,000, and he indignantly left me. I have had a similar experience a number of times during the past month, and the only thing for me to do is to go away and wait till next year."

"Then you think that time will bring about a change?"

"I do. At least one of two things will happen; either Butte will have a big boom this year or operations will continue to be conducted by the big companies now here, and little outside capital will be introduced. Within the next six weeks or two months a great many mining men will visit Butte because the fame of the camp is rapidly spreading, and it has a better reputation abroad and at home than any other American camp. These incoming capitalists will either buy mining properties at ruling prices or go away dissatisfied, refusing to invest a dollar. For myself, I concede the right to every prospect owner to get all he can for his ground. I should do the same; but since you asked me a pointed question about my success in Butte, I have seen fit to give in reply a plain statement of fact.

PARADISE GOLD MINES.—J. M. Miller, in company with J. S. Clapp, recently visited the mines in the vicinity of Paradise valley, and is very much pleased with the prospects there. The main leads so far worked on are the Eagle and the Vulture, situated about two miles in a southerly direction from the springs. He made a close examination of the Vulture. It crops out boldly for a distance of 600 feet. The lode is well defined, and whenever work has been done shows a body of pay quartz from two to four and a half feet wide. He tried about 50 samples from different parts of the lead with a prospecting horn, and found it would work from $5 up to $150 a ton, free gold, and he is satisfied that it will develop into a valuable property, with a small amount of capital judiciously invested. The formation is granite. The springs, which are owned by the Vulture Company, consist of three—two warm and one cold—and afford quite a supply of water, an abundance for mining purposes, but there is no fuel there except about 100 mesquite trees, which offer a delightful shade. The distance from the Pioneer Mill, at Hawley's station, is 18 miles over a good road, which passes by Coyote Holes, 10 miles from the station, where there is plenty of water.—*Calico Print.*



THE KEELY MOTOR AGAIN.—The president of the Keely Motor Stock Company, Mr. Edward Randall, of Brooklyn, is one of the officials of the Erie railway, and he is a firm believer in the successful application of the new power which he thinks Mr. Keely has discovered. "There is a discovery without any sort of doubt," he said yesterday; how he is going to apply it is the only question which troubles us. The Erie engineer, Mr. Canute, says it is some new and to him mysterious motor, and he has been the generator repeatedly. We are now building," added Mr. Randall, "a locomotive of 500 horse power, with which we propose to draw a train of Pullman Palace cars from Philadelphia to this city." "At what time?" "In August next." "And in what time?" "Ah!" that remains to be seen."—*N. Y. Tribune.*

The Harmon Seminary.

We give a sketch of the Harmon Seminary for young ladies at Berkeley. The engraving although it hardly does justice to the pleasing details of the buildings and surroundings gives an idea of the exterior features of the institution: The Seminary Building, which was erected in 1882, is pronounced by all who visit it a model of excellent construction and tasteful finish. It was planned with special reference to its use as a Boarding and Day School for Young Women. It is a commodious, three-story, suburban villa. Its interior, aside from rooms for general use, has been arranged to secure a cluster of neat and cosy apartments, instead of the cheerless dormitories which are too prevalent in boarding-school architecture. In both its exterior and its internal arrangement and furnishing, it presents the characteristics of a comfortable and commodious private residence, and the impression imparted to the pupil on entering is that of access to a home and not a public edifice. Thus the building is made to conform to the central idea of the institution, which is to combine the influences of a refined and cultured home with the discipline of the school and class-room.

The Seminary is entrusted to the management of Rev. S. S. Harmon and Mrs. F. W. Harmon, who have had an experience of more than twenty years in the education of young ladies in this State. The present institution embodies the results of their ripened judgment in its plan and policy and the accommodations and arrangements are such as their wide observation and experience designated as most desirable. It is not an ambition of this school to bring together a large and imposing array of pupils. Its numbers are limited; hence, each pupil receives that close personal attention and instruction rendered impossible where multitudes are gathered together. The institution is well supplied with instructors in the common branches, and thorough work is done. In the special branches of music, art and laugnages, the masters are among the most eminent in the State. The courses of instruction are various and include all degrees of advancement from the kindergarten upward. The regular course leads to the diploma of the Seminary. There is a special course for those who desire to enter the State University, and special courses, also, for those who desire to advance themselves in music, the arts or literature. The range of instruction is very broad, and, in addition to the matters usual in similar schools, it has practical instruction in floriculture and horticulture for those who desire it; and in silk culture, which is now becoming prominent as a household industry in this State.

The seminary closed a very successful year on May 30th, and the next term will open July 26th.

THE HARMON SEMINARY, FOR YOUNG LADIES, BERKELEY CAL.

DANGER.—Every person must try to learn what dangers are connected with his trade or profession and how they may be avoided. Some of these dangers are dust, lead, quicksilver, arsenic, coal-gas, carbonic acid gas (found in wine and beer cellars), and the poison of dead bodies and sick animals.—*Wolfberg.*

IT IS sagaciously noted that to determine the value of building stone a ramble among the tombs is wise. In far fewer years than most imagine monuments are in decay.

Union Mining District.

There are probably as many mines in this district on which nothing is being done as in any section of the State. Mines that, if properly handled, ought to yield a large amount of the precious metals, and prove a source of profit to the parties operating them; but for some reason they are closed down, and are of no benefit to their owners or any one else. It is claimed by many that the patenting of a mine is generally the means of closing it down. The mines of Ione have been shut down for years, and it is a well known fact that there is not one of them patented; the owners make a pretense of doing the assessment work necessary to hold them, and then lay back and refuse to sell for anything but fabulous prices. There are other sections of this district suffering from the same complaint. Mines are held by parties who won't work them themselves nor allow any one else to.

The most extensively worked mine in this district was the Alexander, which in the course of a little over three years produced nearly a million and a half of dollars in silver. A little over one year and a half ago operations were stopped on this property, but the lack of ore was not the cause. Competent mining men say there is an immensity of ore in sight, and, as yet, no depth is attained in the mine; that the ore goes down there is no doubt, and it is almost certain that the ore bodies will show no decrease in size and richness. The Brooklyn also produced large quantities of good ore, but now it lies idle and unproductive; parties who know say it has still got good bodies of pay ore in it. Capitalists looking for mining properties capable of producing large quantities of ore can find several in Union mining district. The mines of Ione alone, worked systematically, are capable of producing ore enough to make them dividend payers, but a moderate outlay of capital would be needed to open them so that ore could be taken out advantageously. John Centras' mines, at Centrasville, are also well worthy the attention of those who are seeking a good investment. In the leading mine there is a fine strong ledge carrying high grade ore. In Union canyon there are numerous prospects on which considerable work has been done that show more or less ore of a good grade.

The McMahon & Irvine C. M. & M. company have resumed operations in the Centennial. This mine has every indication of developing into one of the most valuable properties on the coast, but it will take coin to open it and make it a bullion producer. In the main tunnel ore of a high grade has been cut, and as the face of the tunnel is advanced, it continues to come in stronger. Preparations are being made for the erection of a ten-stamp mill (with a capacity for twenty stamps) to reduce their ores. We sincerely hope that the efforts of the management will be crowned with success, and that the hearts of the stockholders may soon be gladdened by the payment of regular monthly dividends for years to come. [Since writing the above all operations have been suspended in the Centennial mine and the work of grading stopped for the mill, for what reason we know not. One thing is certain, however, the mine looks vastly better now than at the time machinery for the mill was ordered. If it is the intention of this company to open their mine in a thorough and systematic manner, and work it for what it contains, and not as a stock gamble, they can rest assured it will take capital to do it. Starting up a property and running it for a few days and then closing it down, not only hurts the reputation of the mine but does serious damage to every other mining property in its vicinity.]—*Grantsville Bonanza.*

SELFISHNESS AND HAPPINESS cannot flourish on the same stem. He who cares only for himself never finds what he seeks; he grows narrow, stunted and mean, and becomes at length incapable of any but the meanest enjoyment. It is as if he were surrounded by flowing streams, and, though athirst, has not the power to drink of them. It is only the man of generous impulses who can know what real happiness is; but to develop these impulses in the right direction and make them truly valuable to mankind, thoughtful intelligence and wise discretion are indispensable.

Better Metallurgical Methods.

The metallurgical processes of the present day are not up to the standard required by the position and importance of the mining industry. This position is, doubtless, largely due to the fact that scientific men have not given the subject the attention which its importance demands, and the business has been conducted, to a large extent, at a remote distance from business centers, and the presence of skillful and well informed men. Under the present methods the element of loss is too great a factor—loss of time and valuable material. In many localities the most primitive methods and agencies are in use in the reduction of ores; appliances that show no improvement in the whole history of mining for centuries.

In almost any other department of the mining industry, especially in the working of mines, a marked advance is everwhere apparent. The compressed air drills, the steam hoisting machinery, the improved explosives, and all the arrangements for mining the ore, show but slight resemblance to those in use even a few years ago. As mining comes more and more a productive industry, and is operated in a legitimate manner, for the development of mineral resources, the condition of facilities and the unsatisfactory results of present processes for the reduction of ore must demand attention and compel a revolution in means and methods. The product of the mines of the country is estimated from the portion of mineral that appears in the channels of industrial and commercial activity. If to this utilized portion could be added that which has been lost between the mouth of the shaft and the bullion mould, the result would be surprisingly different. Estimates of the Treasury Department show a decrease of the gold produced in California, during the past year, amounting to $1,000,000. We will venture to state that it is more than probable that the tailings of mill and flume have borne away more than five times that amount within the year, and the annual loss of precious minerals, under present methods of treatment, would more than pay the cost of all investments made. Under careful management the waste dump, slag pile and tailings, even with prevalent means, have, in many instances, given better results than the mine from which the ores were taken. This ruinous factor of waste must be eliminated before the problem of successful mining be definitely solved. Mining, grand as is her present showing, never can be truly estimated in the full measure of her magnificent resources until this vampire of loss shall release its paralyzing grasp.—*Idaho World.*

An Electric Sluice Box.

We witnessed this morning the operation of a new style of sluice box, to be used on mill tailings and in washing gravel. The appliance is a new one, the patent on which has been applied for by C. H. Wetzel and F. J. Taylor. The sluice box used is the ordinary shape and size, in the bottom of which are arranged wedge-shaped riffles, two abreast, but with the ends reversed in every set. The riffles are each about a foot long, and all are covered with a sheet of zinc and copper, the copper being next to the wood. The copper plate has the zinc fastened to it so that the zinc is not allowed to touch either the riffles or the side of the box. In this way it is claimed that an electric current is generated that precipitates and catches all mineral in solution passing off in the tailings, and at the same time a stronger affinity is created between the mineral in its natural state and the plates. The reversed motion given the water and pulp in its passage through the sluice box, by means of the alternated wedge-shaped riffles, will, it is contended, bring every particle of mineral in transit in direct contact with plates; which, being charged with both electricity and quicksilver, will seize and hold the same. There is also suspended in the sluice box a small wheel with copper arms that are also charged. The current of water passing underneath this wheel revolves it, thus again bringing a charged copper surface in contact with the "slimes," and floating mineral in the water. Those two latter substances have baffled the efforts of mill men in times past to successfully work them. At the end of the sluice box is arranged a reservoir, copper-lined, into which all the pulp is emptied. In the center of the reservoir a gate is placed that prevents any pulp from running off into the waste pipe until it has been churned and brought in contact with the metal lining, which gives the apparatus still another chance to seize what mineral may have avoided contact above. Mr. Taylor is making a test of the invention on tailings at the Centennial mill, and a number of mining and milling men who have witnessed its operation have high opinions of its merits and speak confidently of its success.—*Inter-Mountain, (Butte, M. T.)*

MESSRS. WM. T. COLEMAN & CO., of San Francisco, have purchased the defunct Standard Soap Co.'s fine plant at Alameda Point, which they will use as a borax factory to refine the crude mineral from the Death Valley mines.

THE SAN FRANCISCO MINING AND SCIENTIFIC PRESS speaks favorably of the substitution of silver for iron in making shoes and dies for amalgamating pans. It has been tried in this Territory with good results.—*Prescott Courier.*

USEFUL INFORMATION.

How Tea is Adulterated.

The New York Tea Appraiser has completed the investigation of the cases of teas brought to this country by the Flintshire, and found that a large proportion of it is grossly adulterated. He to-day presented his report to the Collector, showing that he had rejected 3,100 packages, which if sold in the market might have there realized about $22,000. These teas consisted of greens of all colors, sizes and descriptions, some of which were mixed with sand, some with gravel, others composed of exhausted leaves, and still others being composed of dirt and paste rolled into pellets. Above five hundred packages of colored Japan dust were also rejected on the ground of high color and the admixture of mineral substances, intended to make the tea heavier in weight. This tea was also brought to this country by water, on board the Flintshire.

The Collector and Appraiser of the port of St. Louis have forwarded to Davies samples of the so-called tea sent to this city by way of San Francisco. The examination has clearly shown that the stuff was only wild leaves, indiscriminately collected and dried and sent to this country to be palmed off as tea. This was intended to be sent to a part of the country remote from the regular markets, and there disposed of as tea, regardless of the fact whether or not it was an injury to consumers. Davies said this morning that the new crop now arriving overland appeared to be of good quality.

TO MEASURE THE FLOW OF STREAMS.—The *Manufacturer and Builder* gives the following very simple method: To measure water roughly in an open stream, take from four to twelve different points in a straight line, across the stream, and measure the depth at each of these points, and, adding them together, divide by the number of measurements taken. This quotient will give you the average depth, which should be measured in feet. Multiply this average depth by the width in feet, and this will give you the square feet of cross section of the stream. Multiply this by the velocity of the stream in feet, per minute, and you will have the cubic feet, per minute, of the stream. The velocity of the stream can be found by laying off 100 feet on the bank, and then throwing a board into the stream at the middle, note the time required to pass over the 100 feet, and dividing the 100 feet by the time and multiplying by sixty gives the velocity in feet, per minute, at the surface. The velocity at the center is only eighty-three per cent of that at the surface, and so only eighty-three per cent should be calculated. For example, suppose the float passes 100 feet in ten seconds, this, divided by ten and multiplied by sixty, (seconds in a minute) gives 600 feet, per minute, as the velocity, and eighty three per cent of this gives 498 feet, per minute, as the velocity of the stream at the center, and the area of the cross section, multiplied by this, will give the number of cubic feet, per minute, in the stream.

OUR BIRDS.—It would be well if a little more information were imparted in our schools on the subject of our birds, song birds especially, for the amount of good work done by insect-eating birds is something wonderful. A writer in *Good Words* gives an illustration of the enormous appetite of the bird. A thrush will eat at a meal the largest snail that England produces. If a man could eat as much in proportion, he would consume a whole round of beef for his dinner. The redbreast, again, is a most voracious bird. It has been calculated that to keep a redbreast up to his normal weight, an amount of animal food is required daily equal to an earthworm 14 feet in length. Taking a man of average weight, and measuring bulk for bulk with the redbreast, and assuming a sausage nine inches in circumference to be a fair equivalent of the earthworm, it is found that the man would have to eat 67 feet of such sausage in every twenty-four hours. By these two examples it will be seen what slayers of insects our birds are, and it seems almost beyond belief that they should be slain. If information such as the above were more widely disseminated, we should hear less of the practice, injurious as it is wanton, of bird's-nesting and bird-catching, in which boys and young men take only too much delight.

PAINT FOR BOILER FRONTS AND SMOKE STACKS.—The *Manufacturer and Builder* recommends the use of the Silico-graphic paint, so called. It is furnished already mixed, and may be further thinned down with oil when desired thinner. The practice reported by one of the master-mechanics at the Hornellsville shops of the Erie Railway Co., on locomotive smoke stacks, it strikes us, would be useful to follow in the case of boiler fronts. His practice is to rub the paint into the iron with waste, and, sift over it some finely powdered blackhead, and polish briskly with a brush. The result is reported to be a rich, glossy, smooth black surface, which will not burn off, and is very durable.

NEW USE FOR THE POTATO.—If what the *Agricultural Gazette*, of Vienna, gravely states is true, Ireland may potentially possess a gigantic fortune in her ability to raise innumerable potatoes. That paper says that the humble but indispensable tuber may be transformed into meerchaum pipes of the first quality, and likewise into any article now made of ivory, by subjection to the following treatment: Having been carefully peeled and suffered extraction of its "eyes," the potato is boiled steadily for 36 hours in a mixture of sulphuric acid and water, after which it must be squeezed in a press until every drop of natural or acquired moisture is extracted from it. The residuum of this simple process is declared to be a hard block of a delicate, creamy, white hue, every whit as suitable to the manufacture of ornamental and artistically executed pipe-heads as the finest clay, and unsurpassed as a material for brush and umbrella handles, billiard balls, fans and chessmen.

GOLD GLASS.—There appears to be quite a run of late by manufacturers upon novelties in expensive gold and silver artistic glass. The executors of the late Joseph Webb, of the Coalburn Hill Glass Works, Stourbridge, have entered the lists, and have brought out what they term the "New Gold Glass." It is made in various ornamental shapes for the drawing room. The surface has a crumpled appearance, colored with gold, which is worked into it in the course of manufacture. The gold surface is not to be compared to gilding, it being, as it were, a top layer of the glass, and is brought in combination with different colored bodies. Some are worked out in green, and others in amber glass. The elevation of the crumpled shapes admits the light through, which throws up the tinge and adds to the effect. This firm also makes a specialty of glass furniture.

A PLASTIC MASS, which is valuable for many purposes, is made under a recent German patent, by well mixing, in equal proportions, ground calcined and paste magnetite, and a solution of sulphate of magnesia of 1.9 specific gravity, and running the mixture into oiled molds. The mass can be washed with warm soap and water, when hardened and will have the appearance of white marble, the hardness of which it also acquires with time. This new substance is called "marmorin."

COVERING FABRICS WITH A FILM OF TIN.—A recent French process consists in permeating fabrics with a solution of tin. A mixture of zinc powder and dissolved albumen is first made, and spread over the fabric with a brush, and, after drying, the stuff is passed first through superheated steam, then through a solution of chloride tin. In this way an exceedingly thin layer of tin is spread over the whole side of the fabric, which is thus rendered waterproof, and protected against ordinary rough usage.

GOOD HEALTH.

Hints on Sleep.

The question of chief importance to most people in these overwrought, wakeful days and nights is how to get good sleep enough. Dr. Corning drops a few simple hints which may be of value. In the first place, people should have a regular time for going to sleep, and it should be as soon as can well be after sunset. People who sleep at any time, according to convenience, get less benefit from their sleep than others; getting sleep becomes more difficult; there is a tendeney to nervous excitability and derangement; the repair of the system does not equal the waste. The more finely organized people are, the greater the difficulty and the danger from this cause. The first thing in order to sleep well is to go to bed at a regular hour, and make it as early as possible. The next thing is to exclude all worry and exciting subjects of thought from the mind some time before retiring. The body and mind must be let down from the high-pressure strain before going to bed, so that nature can assert her rightful supremacy afterward. Another point is, never to thwart the drowsy impulse when it comes at the regular time by special efforts to keep awake, for this drowsiness is the advance guard of healtby, restorative sleep.

Sleep is a boon which must not be tampered with and put off, for if compelled to wait, it is never so perfect and restful as if taken its own natural time and way. The right side is the best to sleep on, except in special cases of disease, and the position should be nearly horizontal. Finally, the evening meal should be composed of food most easily digested and assimilated, so that the stomach will have little hard work to do. A heavy, rich dinner taken in the evening is one of the things that murder sleep. Late suppers with exciting foods and stimulating drinks make really restorative sleep next to impossible. Narcotics are to be avoided, save as used in cases of disease by competent physicians. The proper time, according to Dr. Corning, to treat sleeplessness is in the daytime, and it must be treated by a wise and temperate method of living rather than by medicines. This is good common sense, says the New York *Star*, from which paper we copy, and doubtless a vast deal of the debility, nervous derangement, and the insanity of our time would be prevented by more good, restful, natural sleep.

MOSQUITO OIL.—The following is a very good mixture for anointing the face and hands while fishing: Oil of tar, 1 oz.; olive oil, 1 oz; oil of pennyroyal, ½ oz.; spirit of camphor, ½ oz.; glycerine, ½ oz.; carbolic acid, 2 drachms. Mix, and shake well before using.

The Evil Effects of Tobacco.

Many years ago Dr. Wm. A. Alcott published a very valuable little work on the "Physical, Intellectual and Moral Effects of Tobacco on the Human System." That work has since been revised, with notes and additions, by Nelson Sizer, and published by Fowler & Wells, of 753 Broadway, New York. In the new addition Mr. Sizer has added a sufficient amount of matter to nearly double the size of the book, and has brought the information and the facts bearing on the subject down to the present time. It shows the effects of the tobacco on the teeth, on the voice, and on the special senses; also its effect on the appetite and digestion, and how it leads to various diseases; its effect on the intellect and morals, and points out who are suffering most from its use. The slavery to tobacco is discussed in an extended and interesting account, giving the history and confessions of a tobacco chewer, and showing how he gave up the habit. An interesting history of a smoker is given, showing the great benefits he derived from quitting its use. This work should be in the hands of those who wish to have presented a feasible way of overcoming the habit, as it is shown that the greatest slave of tobacco may learn how to give it up without much difficulty, or the feeling of nervous loss, and so become thoroughly restored to self-mastership and health; and especially should it be placed in the hands of the boys, and of moderate smokers who have not yet fully acquired the habit. Its arguments are convincing, and we know of no better use that can be made of 25 cents than to send it to the publishers of this little book, and on receipt of the amount in postage stamps they will send it to any address by mail, post paid.

HOW TO REMOVE BLACK WORMS FROM THE FACE.—A contemporary says: The black points, flesh worms, or comedones, which are found in the face, and especially near the nostrils, are not at all produced by the accumulation of the particles of dirt or dust, as has generally been believed, but by pigmentary matter, which is soluble in acids. The following treatment bas been recommended: kaoline, four parts; glycerine, three parts; acetic acid, two parts, with or without the addition of a small quantity of some ethereal oil. With this pomade cover the parts affected in the evening, and if need be, during the day. After several days all the comedones can be easily expressed; most of them even come out by washing the parts with pumice stone soap. The same results can be obtained by bandaging the parts affected for a long time with vinegar, lemon juice, or diluted hydrochloric acid. The acids act like cosmetics, as they transform the black color into a brown and yellow shade, and destroy it gradually altogether.

POISON IN POTATOES.—No person should buy their potatoes of grocerymen who let them stand in front of their stores in the sun. Potatoes belonging to the "Solanum" family, of which the deadly night shade is one of its full brothers. All branches of the family contain more or less of that poisonous nareotic, called "solanine." The bulb, or potato, contains the least of this, unless they are exposed to the sun, which rapidly develops this element. Long exposure to the light, without the direct sun, will develop the solanine in the potato, and make an article unfit for food. But exposure to the sun is so injurious to the potato, making it not only unpalatable, but actually injurious to health, that any grocer for the offence of selling potatoes which have been exposed two or three days to the sun ought to be indicted for selling unhealthy and dangerous human food.—*Albany Journal.*

CHLOROFORMING THROUGH KEYHOLES, ETC.—We read now and then of cases in which burglars are supposed to have rendered their victims unconscious by holding cloths wet with chloroform to keyholes before entering an apartment. Of course the absurdity of such a fiction is sufficiently apparent. Whether sleepers can be made to pass from natural to chloroform sleep, if the chloroform is held near to the face, is still a question. Sometimes the experiment has succeeded, but in five experiments recently made to determine the fact, every one of the sleepers experimented upon woke at the expiration of three minutes, before they had come under the influence of the drug.

PREVENTION OF BOILS.—A St. Petersburg physician, Dr. Sieven, commends a very simple treatment for the prevention of this very painful form of abscess. He claims that if the skin be superficially scraped with a knife, so that a drop or two of blood may be pressed through the epidermis as soon as the peculiar stabbing or pricking sensation and slight induration announce the commencement of the boil, it will not be further developed.

CORN AND WART CURE.—Gezou's remedy for corns and warts is prepared as follows: Acid salicylic, 30 grains; extract cannabis indic, 10 grains; collodion, one-half ounce M. A correspondent of the *British Medical Journal* states that he has found the application of a strong solution of chromic acid, applied three or four times a day with a camel's hair pencil, to be the most easy and efficient way of removing warts. They soon become black and fall off.

TABLE OF CONTENTS.

EDITORIALS.—Beach Mining for Gold; New Shaping Machine; Advancement of Science, 1. Passing Events; A New Industry; Blunders in Mining; New Wet Ore Separator; Lead Smelting; Powder or Lime for Blasting, 8. Roasting and Chloridizing Furnace; Mining Patents; Working in Bad Air in Mines, 9.

ILLUSTRATIONS.—Apparatus Used for Gold Beach Mining in Australia: San Francisco Tool Company's New Shaping Machine, 1. The Harmon Seminary for Young Ladies, Berkeley, Cal., 6. Nevin's Ore Roasting and Chloridizing Furnace, 9.

CORRESPONDENCE.—Howells—A New Town, 2.

MECHANICAL PROGRESS.—Solid and Hollow Iron Columns; Visibility of Ruled Lines; The Treatment of Cement; The Origin of Waterspouts; Stopping Engines by Electricity; The Best Material for Joists; Aluminum Coated Iron; Wasting Oil; Pulleys; Marble Veneers, 3.

SCIENTIFIC PROGRESS.—Progress of Electric Science; Absorption of Oxygen by Iron Cement; The Radiation of Silver in Solidifying; To Determine the Heating Power of Coal; Singular Explosions; To Remove the Odor from Petroleum; Origin of the Universe, 3.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 4.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 4-5.

USEFUL INFORMATION.—How Tea is Adulterated; To Measure the Flow of Streams; Our Birds; Paint for Boiler Fronts and Smoke Stacks; New Use for the Potato; Gold Glass; Covering Fabrics with a Film of Tin, 7.

GOOD HEALTH.—Hints on Sleep; Mosquito Oil; The Evil Effects of Tobacco; How to Remove Black Worms from the Face; Poison in Potatoes; Chloroforming Through Keyholes; Prevention of Boils; Corn and Wart Cure, 7.

NEWS IN BRIEF—On page 12 and other pages.

MISCELLANEOUS.—Wood River Bullion; The Silver King Mine at Calico, 2. High Prices for Prospects; The Harmon Seminary; Union Mining District, 6. Better Metallurgical Methods; An Electric Sluice Box, 7

BUSINESS ANNOUNCEMENTS.

Assessment Notice—Seaton Gold Mining Co., S. F
Plumbers' Materials—San Francisco Brass Works.
Dividend Notice—Standard Con. Mining Co., S. F.
St. Mary's Hall—Rev. L. D. Mansfield, Benicia, Cal.
Mining Engineer—B. Salazar, San Francisco.

Passing Events.

This has been rather an "off" week. The national holiday coming in the middle of it has caused a cessation of business, many persons taking a three days' holiday. News from the mines is somewhat meager, also.

More attention seems to be paid just now to the Idaho and Montana mining regions than anywhere else. Many immigrants are coming into those territories, and no doubt hundreds of new mines will be opened this summer. Oregon and Washington are also attracting many, but that population is more of an agricultural one. Southwestern Nevada is being opened up in a rational manner now, and the extension of railroad facilities is developing a wide region. Part of this State is greatly benefited also. In Storey county, the great mining center, prospecting operations are going on, but no developments of importance have been made. Utah is at present, in bullion production, doing very good work.

IT is stated in a Montana paper that some excellent prospects are found in the country bordering the Yellowstone river. At the head of Emigrant gulch, one of the richest auriferous gulches worked in the country, several claims have been located. The Great Eastern is the name of a mammoth vein, 100 feet between the walls, with a fourteen foot pay streak. The owners are about to begin taking out ore and can keep an 80-ton smelter busy with a small force of men.

A New Industry.

Metallurgy of Nickel.

Mr. George J. Rockwell, of this city, has recently made the first bar of nickel ever produced on the Pacific Coast directly from the ore by one single process. The ore worked was of low grade (4½ per cent of nickel) but the process employed showed that ore of this quality could be worked practically and economically on a large scale. Mr. Rockwell has applied for a patent on his process, and is now engaged in prosecuting his experiments so as to include other ores of nickel.

Nickel occurs in the form of sulphides, arsenides, arseno-sulphides, antimono-sulphides, a sulphate, carbonate, silicates, arsenate; it also occurs in meteorites. These compounds are of various colors, namely: brass-yellow, tin-white, steel-gray, pale copper-red, rose color, apple-green; the latter color often confounding the mineral with copper carbonate. The following blowpipe test will serve to isolate nickel from other metallic oxides.

Blowpipe Test for Nickel.

Roast a quantity of the pulverized ore thoroughly on charcoal in the oxidizing flame to remove any sulphur, arsenic or antimony that may be present.

Dissolve a very small quantity of this roasted ore in a borax bead on a loop of platinum wire in the oxidizing flame and observe the color produced; oxide of nickel alone, in the absence of other metallic oxides, colors the glass reddish-brown. Saturate the bead with the roasted ore and shake it off into a small dish. Treat this bead on charcoal with a small piece of silver or gold, in a strong, reducing (yellow) flame. Lead may be used instead. Iron, manganese, cobalt, etc., remain in the bead, while nickel, copper, etc., are reduced and collected by the silver or gold button. Remove the button from the bead by breaking the latter on an anvil between paper. Treat the button on charcoal in the oxidizing flame with a salt of phosphorus (phosphate of soda and ammonia) bead, removing it while the bead is hot.

If nickel and copper are present, the bead will be green when cold; if nickel only, yellow; if copper only, blue.

Pacific Coast Nickel.

Nickel has recently been found in several places on this coast. In Oregon there is a large deposit of silicate of magnesia and nickel, technically known as Garnierite; this ore, which will not average more than five per cent. of nickel, nevertheless carries more than some which are worked profitably. Very large and valuable deposits of this metal, also, occur in several localities in Nevada. One of these deposits which is being rapidly developed promises to be the principal mine of nickel on this coast; the ore averages 20% and several tons have been sent to Europe and realized a handsoms profit over all expenses. It is expected that Mr. Rockwell's improvement will make it possible to reduce this ore at home and thus avoid the duty of 15 cents per lb. on the imported metal.

Nevada, which has already showered into our laps her millions of silver, will now add a new source of wealth to this coast.

The annual consumption of nickel in 1879 was about 600 tons, but the recent discovery of Dr. Fleitmann of Germany, who has succeeded in rendering it malleable will introduce it for many purposes hitherto impracticable owing to its brittleness.

Blunders in Mining.

Some of the old mining errors are still being committed. People occasionally now build quartz mills before they are sure of having a mine. Then also they begin working their ore when they try a mine with some new, untried process, and try to develop a mine and process both at once. One is generally enough for ordinary people to attend to. A common blunder is to judge a mine by a rich specimen. The existence of rich specimens is not proof of the high value of a mine. Among experienced miners this excites distrust. As a general proposition, pocket lodes are not very profitable, though sometimes of course they yield large amounts. Sinking deep shafts when nothing is found of value on the surface is in gold mining very risky. Crushing a lot of rock without selection or proper consideration of its value is a common blunder too; as is also failure to make assays of the tailings to see what is passing off.

Trying to run a mine by letter and not by personal presence is pretty often a losing operation. The business requires the supervision of competent men, but when competent men are found they should not be hampered. Absentees can never judge so well as those persons right on the ground.

Perhaps the most frequent error and that which has led many times to disastrous results is in supposing any one can run a mine. Because a man has money enough to buy a mine, or luck enough to find one, it by no means follows that he can manage it properly. Nor is it a reason when a rich man owns a lot of stock that a lot of his relations can run a mine better than old miners. Sending out inexperienced men from the East, putting in storekeepers, sailors, salesmen, drummers, etc., as resident managers; and trusting the ignorance of those they knew rather than the knowledge of those they did not know, has brought many a mining investor to grief.

When one sees these old blunders being repeated again and again, he thinks it strange inexperienced people don't employ proper persons to inform them what to do, rather than squander money, gaining experience on subjects already well understood by thousands.

New Wet Ore Separator.

Miles B. Dodge, of this city, has just received through the MINING and SCIENTIFIC PRESS Patent Agency a patent for an improved separator for wet ores. The apparatus is intended for the concentration of valuable metals and sulphurets from the gangue. The invention consists in the construction and arrangement of a conical water pan, a centrally placed cylinder and piston, a surrounding screen to receive the ore, and novel feeding and distributing devices, all operated by connected mechanism.

The apparatus in general consists of a conical pan or receptacle having a cylinder supported centrally and above the bottom, and around this cylinder a horizontal screen extending across the top of the pan with flanges or rims extending a short distance above it. Within the cylinder a plunger moves vertically, being operated by suitable mechanism, and water is admitted into the pan from below, filling it, so that the sudden downward movement of the plunger will force the water up through the screen and lift the body of ore upon it, so that the heavier, valuable portions will settle through the screen while the lighter material will be kept at the top and will run off over the outer rim when it has reached a sufficient hight, being assisted by revolving plows or scrapers which travel just inside the rim. The material is fed into a hopper surrounding the central shaft, having holes in the bottom which discharge upon a conical distributor, at the bottom of which are openings to allow the material to pass through upon the screen as the distributer revolves.

The operation is as follows: The screen bed being properly supplied with ore, and water being admitted into the pan through the supply pipe until it is full, the machine is set in motion, when the pistou will be lifted by inclined teeth, or cams upon suitable disks, and will be forced suddenly downward by a spring as often as it is raised and released from the cam, thus forcing the water up through the screen among the ore on the surface. The effect of this intermittent rush of water up through the screen is to cause the lighter portions to rise to the top and eventually to flow over the outer rim into the waste chute, and through it to any desired point of discharge. The heavier particles will settle upon and through the screen into the water in the pan, and flowing down its sides will escape through the discharge opening. Plows or scrapers on the arms of the distributing cone assist in discharging the waste material over the outer edge of the screen. The stroke of the piston may be regulated.

A GOVERNOR AS A MINER.—The Eureka *Sentinel* says: Last November Governor Adams purchased at auction, for a song, the personal property of the old Lemmon mill. When he was here, recently, he made arrangements with "Scotty," the well-known teamster, to haul it to Reveille, to his Gila mill. Yesterday 31,450 pounds of the freight were loaded up, and Heyworth started with a part of it, and "Scotty" follows with the rest of it to-day. The Governor has several thousand tons of tailings from the Gila mine, which will go over $30 per ton. The freight is composed of a White furnace, which will be put up at the mill for the purpose of roasting the tailings.

Lead Smelting.

For easily smelted ores, carrying a high percentage of lead, the Belgian smelting process is a good one. The furnaces greatly resemble the Flintshire, except the Belgian has two fireplaces—one at each end—and the hearth, instead of being concave as the Flintshire, slightly inclines at an angle, from both fire-places toward the center. The object of the two fireplaces is to economize fuel and afford a greater uniformity of temperature. The charge remains in the furnace 16 hours. Two workmen only are employed.

When the furnace is first charged, the temperature is kept for about half an hour at a red heat. At the end of this time the charge is worked, with short intermissions, for six hours, the temperature being raised toward the last to a cherry red heat. Molten lead now appears; the doors are closed and the temperature raised. In about four hours, during which time the ore is turned every half hour, lead ceases to flow, when powdered charcoal and lime are mixed with the charge to make it pasty and to reduce the oxides and sulphates which are formed. The charge is heated (being repeatedly worked) for about four hours longer, great care being taken that the temperature does not rise above a certain limit, lest other metals should also be reduced.

The dross is now subjected to an increased temperature for one-half to three-quarters of an hour, whereby it is agglomerated. It is then withdrawn from the furnace and smelted in a low-blast furnace, with slag from the smelting of the impure ores, dross from the lead refining furnace, and agglomerated fumes from the condensing chambers. The object in thus slowly roasting the ore, and conducting the reaction process by a low temperature, is manifold. With ore containing much copper and antimony, their reduction is avoided by the comparatively low temperature, and on the first reaction period the lead is not only purer, but holds most of the silver in the ore, and as the operation ceases when the lead in the dross reaches 60 per cent, the volatilization of lead is diminished. The loss of lead amounts to about five per cent. The amount of dross is great but the combined losses occurring both in the reverberatory, and the following smelting in a low-blast furnace is much smaller than it would be were the reduction originally carried on to greater extent in the reverberatory furnace.

Powder or Lime for Blasting.

We have several times noticed the experiments that are going on with relation to the use of lime for blasting in fiery coal mines. Not long since we gave a description of the way the process is carried out. Mining engineers in studying up the subject should not only consider the question of cost in coal mining, but also that of life-saving. It seems all the inquiry is as to cost alone; but the miners' lives should be considered as well. Still, as to cost, some comparative results are now obtainable with lime cartridges in place of wedging for twelve months at the Shipley collieries. It must be understood that in working the deep hard coal at these pits no shovels are allowed in the stalls, and only such of the small coal as can be picked up by the hand is sent to bank, the rest being thrown back into the gob. The quantity of coal produced per acre by the use of lime cartridges is seventeen per cent greater than from those stalls where wedging is still practiced. No comparision is made with the cost of powder, as no powder has been used here for twenty-five years.

In Belgium, the result of six months' work ing at "Hasard" collieries gives an increased percentage of large of from twenty to twenty-five per cent, and an increase selling price of from one and a half to two francs per ton after allowing one-half franc for additional labor in undercutting to prepare the coal better for the action of the lime cartridges.

There has been great delay in getting efficient machinery made for the factories which will shortly be erected in different parts of the kingdom. When these manufactories are in working order the large number of collieries now awaiting to adopt the system will be in a position to give more extended information.

GALENA, Idaho, has a good smelter, but the miners are anxious to sell their mines and indifferent about extracting the ores, and the smelter is standing still this summer for want of ore to smelt. Other localities are pursuing the same course.

Roasting and Chloridizing Furnace.

Robert A. Nevin, of this city, has a patent on an improved roasting and chloridizing furnace, designed to work low grade refractory ores of gold and silver quickly and cheaply with no waste of salt or loss of precious metals. The accompanying engravings show the form of furnace. Fig. 1 is a side elevation, and Fig. 2 a plan. In the accompanying drawings, *A B* represent the cylinders encircled by bearing-rings, *a*, which rest on friction-rolls, *C*, which are suitably journaled in boxes, *b*, that are fixed on a bed, *D*. Said cylinders, or furnaces, *A B*, are set at an inclination of an inch to the foot, or thereabout, and are designed to be revolved by means of worm and wheels, *E*, or other suitable device. The two furnaces, *A B*, are set at different elevations, the furnace, *A*, having its higher and receiving end revolving in a flue, *F*, that is connected directly with the smoke-stack, *G*, while its lower end revolves in the fire-box, *H*.

Extending laterally from the fire-box, *H*, is a flue, *I*, that extends parallel with the flue, *F*, for a short distance, and then turns at right angles and enters the smoke stack, *G*. The higher, or receiving end of the furnace or cylinder, *B*, revolves in the flue, *I*, on a lower plane than is the fire-box, *H*, and the lower end of said furnace, *B*, is supported in a fire-box, *K*, on friction-rolls, or other suitable device.

When the device is in operation the ore to be operated upon is fed into the higher end of the furnace A through a hopper, (indicated at *c*,) and passing through the furnace *A*, is exposed to a gradually-increasing temperature as it approaches the fire-box H, whereby the ore is wholly or partly desulphurized, the sulphurous fumes passing off at the same time through the flue F directly into the smokestack G. From the lower end of the furnace A the desulphurized ore falls through an inclined passage or chute, *d*, in the flue *I* into the higher end of the furnace B, and as the desulphurized ore passes through said passage or chute *d*, common salt is introduced through the hopper *f* to mix with the ore and fall with it into the furnace B. The mingled ore and salt then gradually descend through the furnace B, exposed to a gradually-increasing temperature as they approach the fire-box K, whereby the metallic portions of the ore are chloridized, until the ore finally falls into a receptacle, (indicated at *g*,) whence it may be removed for lixiviation or amalgamation. In this operation, the ore being wholly or partially desulphurized or oxidized before the application of the salt, the metallic portions of the ore and the chlorine of the salt more readily and thoroughly combine, thereby effecting a saving of salt and of the metals over the ordinary methods; and the passage of the ore from one furnace into the other being continuous the ore does not become cooled in the operation. It is well known, of course, that it is not new to first roast the ores by themselves and afterward with common salt. In this the two furnaces are combined and connected by a chute, and the salt is introduced into the ore in the passage of the latter from one furnace to the other.

One of these furnaces is running at the Nevajo-Independence mill, Tuscarora, Nev. It gives very good satisfaction. The superintendent says that the improvements made in the manner of desulphurizing and chloridizing have added four per cent to the working results, and a saving of 25 per cent in salt. The workings have averaged 94 per cent since this furnace was put in use. The shipments of bullion from the mill have been steady, showing results of the most satisfactory kind. They have shipped, since they begun working with this furnace, some $700,000; capacity of mill, 10 stamps.

The principle on which the Nevin patent ore-roasting and chloridizing furnace does the work so effectually and quickly is based on the old and approved method of oxidizing or desulphurizing before chloridizing.

There are two flues, a construction which admits of driving off the fumes while the ore is being desulphurized, but the chlorine of the salt is retained in the chloridizing furnace. Robert A. Nevin, patentee; box 2361, San Francisco, Cal., will issue licenses for use or sale; or will construct furnaces.

Two hydraulic miners, G. F. Jacobs and Michael O'Brien, coming into Nevada City from the Sargent & Jacobs' hydraulic claims, at Quaker Hill, were "stood up" by two masked highwaymen. The robbers took an iron pail containing $1,200 worth of wet amalgam, cleaned up that day from the head flumes of the Scott's flat set of diggings.

Mining Patents.

The Commissioner of the General Land Office a short time since rejected the application for patent of a California gravel mine, because in the necessary publication of the notice the tract was described as the east half of a certain section when it was really the south half. The initials S and E were used as is customary in such notices. The owners of the tract applied to the Secretary of the Interior, who rules that patents cannot properly issue unless the land applied for is specifically described in the publication, or with such certainty that persons in interest cannot be misled thereby. Publication as to the E. ½ of the tract in question was not publication as to the S. ½, and persons interested in the S. ½ were not required to take notice thereof. It is immaterial that, as claimed by appellants, this was a typographical error merely, because it was not, legally or in fact, publication of notice of the ten acres of land applied for.

The Secretary does not say, therefore, that the Commissioner's decision is erroneous, but he modifies that decision, and directs that if appellants shall so elect, they may, within sixty days, under direction of the Register, publish a supplemental notice of their application for patent for said S. ½, with the same rights thereunder, and the same rights to other parties, as if it were an original publication, provided the tract shall not then be otherwise appropriated, or valid adverse rights shall not have attached thereto; and if such right shall not have attached, the Commissioner is instructed to withhold the tract from other disposition pending the time allowed appellants for selection.

Working in Bad Air in Mines.

We have several times referred to the apparatus for working in bad air underground, which is being introduced in the various England collieries, where it is kept for use in case of accident. It is called the Fleuss apparatus. It is self-sustained and wholly independent of the surrounding atmosphere, and will supply breathable air for four hours at a time, thus enabling the wearer to breathe with safety in the most deadly gases. The principle of the apparatus is, that the wearer breathes his own breath over and over again, the carbonic acid being taken from it at each respiration and the requisite amount of oxygen restored, the revivified breath is fit to be again inhaled in the form of pure air. The apparatus, which is carried upon the back of the explorer, in the form of a knapsack, consists of a strong sheet copper cylinder, twelve inches by six and one-half inches, with domed ends, and capable of holding four cubic feet of oxygen gas, at a pressure of sixteen atmospheres. Above the cylinder and attached to the side of it is a square metal box, twelve by twelve by four inches, to contain the filter, which is a box of vulcanite divided into four compartments by vertical diaphragms, and with a wooden lid, made air-tight by an india-rubber washer, and having an inlet and outlet pipe with valves attached. This box is filled with hempen tow and stick caustic soda; the exhaled breath passes twice up and down through the tow and soda, and is thoroughly freed of carbonic acid, the excess of moisture collecting under a perforated false bottom arranged for that purpose. A flat bag of vulcanized india-rubber, 15 by 12 inches, is fastened in front of the wearer, and is connected by an india-rubber pipe passing over the shoulder to the outlet pipe of the filter: the bag is also in communication with the oxygen chamber, and the supply of oxygen can be regulated by a jamb screw valve under the control of the wearer. An india-rubber mask is made to fit airtight to the face and is held in place by straps buckled up at the back of the head. The mask is fitted with a pair of flexible pipes, the one for exaling being in communication with the inlet pipe of the filter, and the other for inhaling being in communication with the air bag. The exhaled breath having passed through the filter, enters the bag in a purified state, and there meeting with its complement of oxygen, is fit to be again inhaled. The bag, being perfectly flexible, readily expands or contracts as the breath passes in or out of it, so that no effort is required in respiration. Foster and Fleuss' safety mining lamp is a modification of the lime light, methylated spirits of wine being used instead of hydrogen gas, and consists of a strong copper sphere, seven inches in diameter, and capable of being charged with oxygen at a pressure of from sixteen to twenty atmospheres. To the top of the sphere is attached a small spirit lamp with two wicks, between which, through a small jet, a minute stream of oxygen, regulated by an adjusting valve on the sphere, is allowed to pass, carrying the flame against a cylinder of lime held on a stud placed to receive it. The light is covered in and rendered perfectly safe from inflammable gases by a double dome-shaped metal casing, having an annular space left between its inner and outer surfaces, which is filled with water. Discs of plain glass are inserted opposite each other in the inner and outer casings and a small outlet valve is fixed in the inner case near its lower part for the escape of the products of combustion from the inside of the casing into the annular space filled with water between the two cases, through which the gases bubble and escape through another outlet valve fixed on the top of the outer case. The cover is attached to the lower part by means of a screw, an airtight joint being made by a leather washer seating. The lamp will burn for four hours under water, in carbonic acid or in firedamp, and it cannot get hotter than boiling water. The essence of these inventions is, that all means of communication with the surface or pure atmosphere is now dispensed with, and the wearer of Fleuss' dress is enabled to carry with him, not merely compressed air, but more compactly, and therefore lasting for a longer period, the ingredients for producing and reproducing breathable air. The lamp also is isolated and self-contained, giving light that is inaccessible to the gases or water by which it may be surrounded without imparting or sustaining injury, and without any connection with tubing or electric wires.

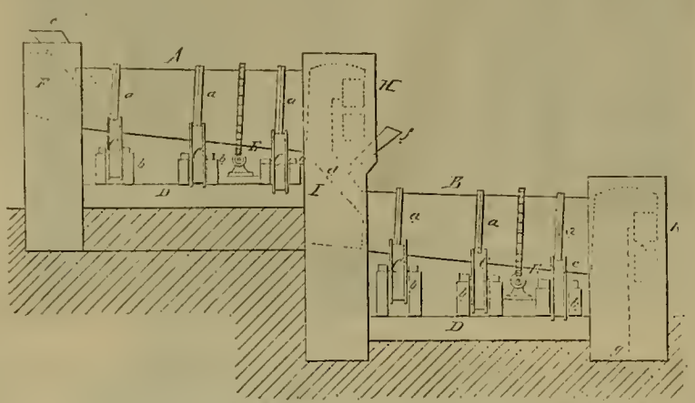

FIG. 1.—NEVIN'S ORE ROASTING AND CHLORIDIZING FURNACE.

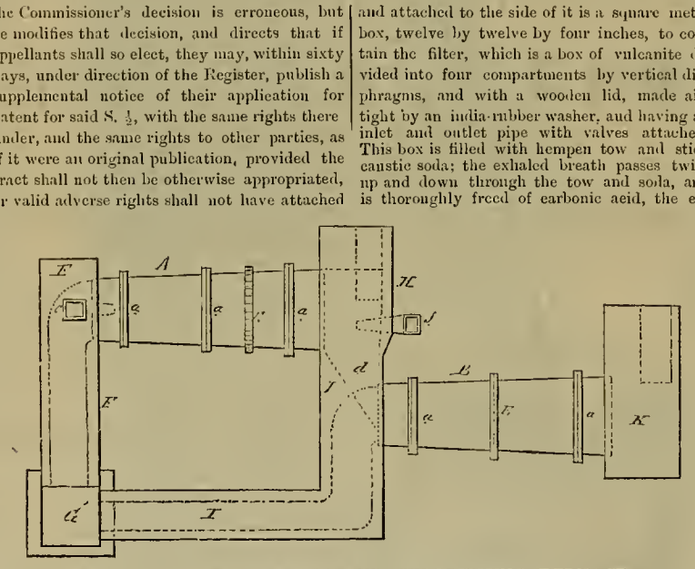

FIG. 2.—PLAN OF ROASTING AND CHLORIDIZING FURNACE.

Reduction Works.

The Mardoch reduction works, which are to be put in operation at Ogden this season by a company of Eastern capitalists, propose to combine with facilities for reducing the various kinds of ore, sampling works and the purchase of ores on a large scale. We hear of sampling works being contemplated at several other points where ore purchasers and miners will be accommodated, but sampling works and ore purchasers at Ogden will benefit only the few miners in this camp who have a sufficiently high grade of ore to warrant the expense of transportation to that point. Could the ore market be brought to our door by the establishment of the works here, not only would thousands of men be employed in the works and in extracting ores from lower grade mines, but the capital employed would be kept at home and the projectors of the enterprise could buy their ores at prices so reasonable as to insure a large return on the capital invested. —Butte *Miner*.

Enlarged Issues of the Mining and Scientific Press.

It is the intention of the publishers of this journal to spare no enterprise in advancing the future interests of its readers by all reasonable and practicable methods. Among other advances, we contemplate issuing soon several extra sized sheets, especially devoted to different important localities. The next will be on

Utah Territory, July 2'st.

Utah has won for herself a bright name from her many dividend paying properties, and each year her mineral resources are being more and more developed. The mines are scattered over a wide region and are in great number. The record of bullion shipments is highly encouraging in the interests of legitimate mining. A general description of the mining regions with such maps as will aid in illustrating the locations of the districts, will be given in this edition.

Other double editions will follow shortly after, which will be devoted to the special interests of other mining localities.

All these regions possess more or less interest for California and San Francisco. We ship goods of certain kinds from here, and, from a commercial point of view alone, our interests are mutual. Moreover, the advancement of these regions does good to the whole coast, in which we are all interested.

Persons who can contribute information of special or general interest to our readers for these various issues are solicited to send the same as early as possible. If miners will send us descriptions of their mines or camps we shall be very glad to receive them.

As we make this extra effort to advance the interests of all concerned in the places named, we ask that all who can, to favor our enterprise by making the matters more widely known, and the MINING AND SCIENTIFIC PRESS more extensively patronized. The mining literature of the world is comparatively limited. Miners and scientific men especially should be liberal to assist their helpers in a line of publication, which, at best, cannot be expected to be largely profitable while doing strict justice to the highest interests it represents.

The dates of issue of the proposed extra sheets may be varied, if circumstances should demand it, but due notice will be given.

MENTAL depression, weakness of the muscular system, general ill-health, benefited by using Brown's Iron Bitters.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Ratherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

SAW SWAGE.—Simon Kinney, of Port Townsend, W. T. No. 279,769. Dated June 19, 1883. This invention relates to a new and useful improvement in the class of saw swaging machines, and more especially in that certain machine previously patented by the same inventor. The improvement consists in a novel swaging die or block of peculiar but simple construction. It is of such a shape that it is practicable to make it of a single piece of steel. One side of it acts as a hack or guide to steady the side which is serving as a die, and it cannot rock or roll. It is strong, and has nothing to work loose. Its single guide arm is sufficient, as the pressure is all on the back; and it may be for this reason made less cumbersome than the old form.

New Smelters.

Operations at the smelters continue at a lively rate. One hundred men are now employed in constructing the new plants and running the old ones. Among important buildings recently completed is a large brick stack about fifty feet high and 8x8 at the bottom, which serves as a final outlet for the fumes, which are freed from lead by passage through a lengthy horizontal flue after leaving the furnaces.

One of the forty-ton furnaces was blown in on Wednesday evening, and the remaining one, which is now under preparation, will be ready by the 20th instant.

Ore hauling to the smelters continues at the rate of 50 tons daily. Seven large teams are making regular trips from the West Fork and Irwin mines, while two are hauling from the Elkhorn, two from the Star, one from Star Mountain, and several from East Fork, besides those engaged in hauling fluxes.

The 21 charcoal kilns are kept in operation by the wood from Warm Spring creek, which is floated down in large quantities in the V flume. It is estimated that 5,000 cords are ready for the flume. Everything looks lively at the works, and the new building improvements necessary for the managers and men, being nearly completed, add much to the general appearance of the place.—*Ketchum (Idaho) Keystone.*

A PROSPECTOR'S LUCK.—Sam. Schepp, a prospector, a short time since, went to an old citizen of Graniteville, this county, and asked for a pointer as to where he could go to work and make grub money. He was directed to the croppings of a ledge that crosses the wagon road between Graniteville and Morse's mill, and advised to try his luck there. He sunk down, took out 30 tons of ore and had it crushed, and realized $600. The quartz gets better as it goes down, and now the locator proposes to open his claim systematically. For 17 years Schepp had been picking around the county, but he managed to hit the wrong place every time till now. For a great many years a string of wagons have been traveling over the croppings of this rich ledge, and many a prospector has taken a look at it only to conclude that he could expend his labor somewhere else to better advantage. That's the way the wheel of fortune whizzes around in a mining county. You can't tell when it is going to stop at the right notch.—*Nevada Transcript.*

THE excess in the value of exports over imports for the twelve months ending May 31, 1883, is $99,334,649; total value of imports and merchandise for twelve months ending May 31, 1883, $731,068,482.

"ONE OF OUR MOST INTERESTING EXCHANGES," is the way the *Southern Planter*, of Richmond, Va., speaks of the RURAL PRESS.

Placers and Lode.

A very important decision has been rendered by a federal court in the case of the Iron Silver Mining Co. against Sullivan and the Champion Mining Company. The decision was based upon a number of new questions of law which have never before entered into any mining suit, and the result is that millions of dollars worth of mining property will be affected by it. It decides four different suits, three of which are against the Champion Company. They are all for ejectment. It is claimed that the defendants located lodes within the property patented as placer mines by the Iron Silver Mining Company. In their respective answers they held in general terms only that the lodes were "known" lodes and failed to show whether or not they had ever taken any silver from the lodes or had filed any claim previous to the location of the placer claims. A general demurrer was entered to their answers and the demurrer was sustained yesterday. The decision holds that the term "known lode" within a placer claim does not make the owner's title good unless he can show that he had filed a claim for the lode, which ante-dates the claim for the placer property.

Judge McCrary expressed a wish that the decision in this case, which affects numerous others, might be submitted at an early day to the consideration of the Supreme Court of the United States. He said he had found much difficulty in the construction of sections 2,320 and 2,333 of the Revised Statutes of the United States, the meaning of which is involved in these cases.

A New District.

The Rochester mining district, situated in Madison county, Montana, is just now attracting considerable attention, and the indications point to renewed activity in that section, during the present season. Not a few of the prospects there have been opened up very successfully, and the ore, in the majority of cases, is of excellent grade and exceptional milling quality. The veins crop distinctly and are parallel and continuous. The district has already produced several hundred thousand dollars in gold, but as no one had the enterprise or money to erect a custom mill of adequate capacity, to enable a number of mines to be worked at the same time, mining operations, until quite recently, have never been prosecuted in the district with much energy. Now, however, an awakening interest is felt in Rochester mines, and the fact that the ledges there are in the main gold-bearing, and the ore therefore of a character easy to realize upon, is quite certain to result in the inauguration of a number of important mining and milling enterprises. The latest evidence of this statement is the sale last week of a fourth interest in each of the three properties known as the Magna Charta, Garfield and True Fissure for the sum of $10,000 to Eastern parties represented by John Zurcher and Edward Wright, two solid and well known mining men. These interests were owned by Mr. M. G. Fitzgibbons, a practical and experienced miner, who is also interested in the Santa Maria and Colusa, which are rich and promising claims. Messrs. Larahie and Mellich, of Butte, are also extensively interested in Rochester, and the former, who is a capable mining engineer, speaks very highly of the prospects of the camp. Mr. Van Dusen, of Butte, also bought into a Rochester prospect a few days ago, and will leave to-night for the purpose of exploring his purchase. Before the end of next summer Rochester will rank among the best gold camps on the coast.—*Inter-Mountain.*

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for so many years, the firm' name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That is this understood and appreciated is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

News in Brief.

THE Chicago banks are following the lead of the New York ones, and are using every means possible to throw the trade dollar out of circulation.

THE strike of the Chinese laborers on the Oregon extension still continues, and the Mongolians are provided with three weeks' rations.

ADVICES indicate a general outbreak of smallpox among Arizona Indians, and Commissioner Price has ordered a supply of vaccine virus sent to the threatened points.

IT IS sagaciously noted that to determine the value of building stone a ramble among the tombs is wise. In far fewer years than most imagine monuments are in decay.

THE idea of a prominent European Sanitary Board for protection against epidemics and other diseases, is mooted by the press of Vienna. It is thought that the Austrian Government will officially propose the formation of such a Board.

A CAVE in or filling up of the great diamond mine of Kimberly, in Cape Colony, has caused much distress. The disaster has affected other mines, and ten leading diamond merchants have committed suicide on account of their financial troubles.

MACKEREL and sardines are being caught just now in large quantities off the wharf. If sardines or anchovies are so plentiful and olive oil so abundant here, why cannot the sardine packing business be successfully inaugurated here?—*Santa Barbara Press.*

THE action of the United States authorities and the general expression of the public opinion of America in relation to the influx of paupers from Ireland, have plunged some of the Irish Poor Law Guardians into the deepest alarm and perplexity, and have called forth in England a good deal of sharp criticism.

THE cholera has almost closed Port Said to commerce. The loss and delay consequent upon a lengthy quarantine keep vessels from taking coal and water there. The French fleet is preparing to leave, and transfers of merchandise are refused unless they have been subject to quarantine.

THE production of rails of various descriptions in the United States last year was as follows: Bessemer steel, 1,438,155 tons; iron, 227,874 tons; open hearth steel, 22,765 tons; total, 1,688,794 tons. The corresponding production in 1882 was as follows: Bessemer steel, 1,330,302 tons; iron, 488,581 tons; open hearth steel, 25 217 tons; total, 1,844,100.

THE Philadelphia Smelting Works at Ketchum, Idaho, cover several acres of ground. One hundred tons of ore are delivered daily, all of which is paid for at an average of at least $50 per ton. This gives employment not only to the miners who extract the ore, but to all the business men and citizens of the place, in one form or other, either directly or indirectly. It is said that fifty teams are employed in hauling ore, lime, coke, iron ore and other supplies to these smelting works. While other localities are holding their mines for sale and refuse to take out the ores, under a pretense that they cannot sell or ship them on a paying basis, fifty mines are being worked in this section, and they are selling the ores to the Philadelphia company at remunerative prices.

CONSTIPATION, liver and kidney diseases are cured by Brown's Iron Bitters, which enriches the blood, and strengthens the whole system.

B. SALAZAR,

Mining Engineer and Metallurgist.

Graduate of Freiberg and Clausthal Royal Mining Schools, Germany.

WILL FURNISH ACCURATE REPORTS ON MINES in the United States and Mexico. Also, act as

CONSULTING ENGINEER

To Companies on all METALLURGICAL and MINING MATTERS.

Starting up Tunnels, Smelting or Leaching Works a Specialty.

Several years' Practical Experience in Arizona and Mexico. Would take charge of a mine or reduction works.

TEMPORARY OFFICE with Kustel & Co., 318 Pine St., San Francisco, Cal.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending June 30, 1883, the Board of Directors of the GERMAN SAVINGS AND LOAN SOCIETY has declared a dividend on Term Deposits at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum, and on Ordinary Deposits at the rate of three and six-tenths (3 6-10) per cent per annum, free from Federal Taxes, and payable on and after the 2d day of July, 1883. By order,

GEO. LETTE, Secretary.

DIVIDEND NOTICE.

San Francisco Savings Union

532 California Street, Corner Webb.

For the half year ending with June 30, 1883, a dividend has been declared at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum on Term Deposits, and three and sixty one-hundredths (3 60-100) per cent per annum on Ordinary Deposits, free of taxes, payable on and after THURSDAY, 12th July, 1883.

LOVELL WHITE, Cashier.

PLAIN TRUTHS

The blood is the foundation of life, it circulates through every part of the body, and unless it is pure and rich, good health is impossible. If disease has entered the system the *only* sure and quick way to drive it out is to purify and enrich the blood.

These simple facts are well known, and the highest medical authorities agree that *nothing* but iron will restore the blood to its natural condition; and also that all the iron preparations hitherto made blacken the teeth, cause headache, and are otherwise injurious.

BROWN'S IRON BITTERS will thoroughly and quickly assimilate with the blood, purifying and strengthening it, and thus drive disease from any part of the system, and it will *not* blacken the teeth, cause headache or constipation, and is positively *not* injurious.

Saved his Child.

17 N. Eutaw St., Baltimore, Md. Feb. 12, 1880.

Gents:—Upon the recommendation of a friend I tried BROWN'S IRON BITTERS as a tonic and restorative for my daughter, whom I was thoroughly convinced was wasting away with Consumption. Having lost three daughters by the terrible disease, under the care of eminent physicians, I was loth to believe that anything could arrest the progress of the disease, but, to my great surprise, before my daughter had taken one bottle of BROWN'S IRON BITTERS, she began to mend and now is quite restored to former health. A fifth daughter began to show signs of Consumption, and when the physician was consulted he quickly said "Tonics were required;" and when informed that the elder sister was taking BROWN'S IRON BITTERS, responded "that is a good tonic, take it."

ADORAM PHELPS.

BROWN'S IRON BITTERS effectually cures Dyspepsia, Indigestion and Weakness, and renders the greatest relief and benefit to persons suffering from such wasting diseases as Consumption, Kidney Complaints, etc.

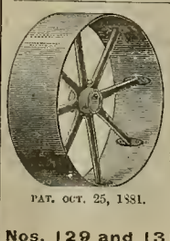
EXCELSIOR BLASTING POWDER,

Manufactured by the



EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro Glycerine Powder, as safe to use and handle as any other Nitro-Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

RANKIN, BRAYTON & CO.,

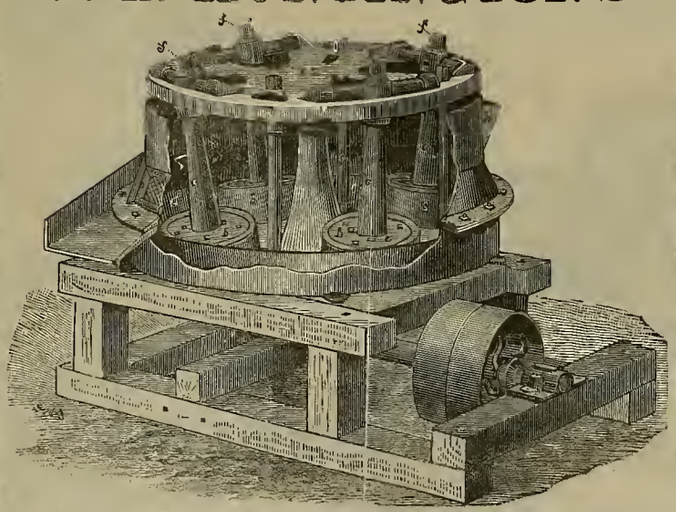
MILL & MINING MACHINERY.

F. A. HUNTINGTON,

No. 45 Fremont Street. - - San Francisco, Cal.

PATTEN'S



CONCENTRATOR

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

F. A. HUNTINGTON'S

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

CAPACITY AND DURABILITY GUARANTEED.

CENTRIFUGAL ROLLER QUARTZ MILL!

After running one of these mills on the Whidden mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

F. A. HUNTINGTON, ESQ.—DEAR SIR: Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Company's property, at Shingle Springs, El Dorado county, Cal., about four months, and it did good and satisfactory work; a greater portion of gold remaining in the mill than in a stamp battery.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

Stampedes and Stock Gambling.

To these methods most often have the more avaricious and mobile of our population had recourse, when seeking to acquire sudden wealth or recuperate their waning fortunes. At first, and so long as the business of gold mining exclusively obtained, this propensity found expression in the old-fashioned stampede, which, though it led to some loss and hardship, was comparatively harmless, the stampeder losing not much besides his time, and others only such small sums as had been expended in "out-fitting" the adventurer.

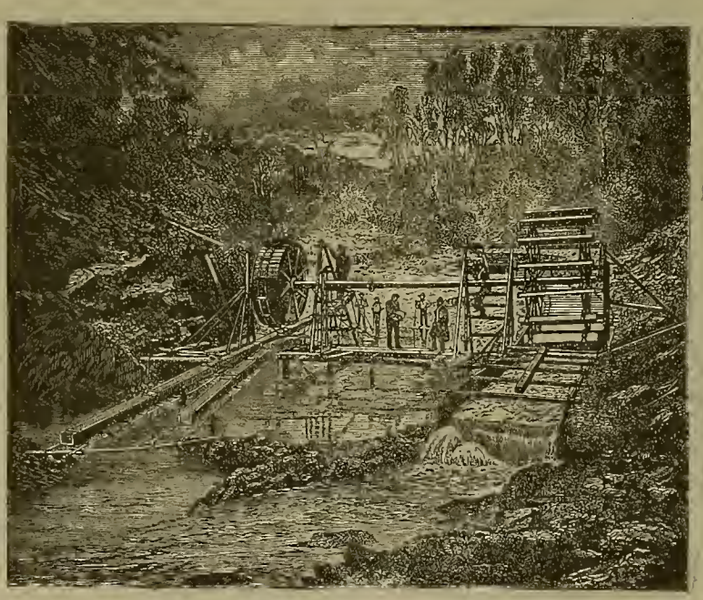
With the discovery of the Comstock lode and the outgrowth of that event, the establishment of Stock Boards, there was inaugurated the practice of dealing in mining shares, which, however it may have made fortunes for the few, and afforded the venturesome classes a convenient medium for gambling, has resulted only in harm to the many. It is not our purpose now to recount the effects of this business during the past 20 years: suffice to say, it has been most malign; falling like a blight on every class, pursuit and interest of our people. It has proved ruinous to thousands, and these belonging mostly to that middle rank in society, who earn what they spend and can but ill afford to lose what they earn. Nor do we intend at this writing to arraign the men who have been responsible for so much disaster and suffering, our object just now being to simply warn these men that another of these raids on the laboring classes of the investing public had better not again be attempted.

During the few years that have elapsed since the subsidence of the stock-dealing furor, our working people—that is, such of them as had not become wholly bankrupted and ruined—have partially recovered from the effects of that business. Cured of the craze that so long afflicted them, they have deserted the halls of the stock-sharp and the dens of the manipulator, and once more betaken themselves to work, content with the earnings of their respective vocations. Debts contracted have been paid up; homesteads have been relieved of incumbrances; lots have been bought and new houses built, and little hoards have again begun to be laid up in the savings banks.

But, now that something of the old-time prosperity and contentment have been restored, we may look for an effort being made by the wily operator to capture the coin of the toiling masses. For some time past a scheme has been maturing for getting up a stock boom, and unloading the worthless rubbish that has been accumulating in a few hands on the unsuspecting public. As yet, not much headway has been made with this nefarious business, principally because the public cannot now be victimized as easily as aforetime, and partially because the newspapers on this coast, including those that make stock operations a specialty, have refused to promote or even encourage any movement of the kind. Our entire population are now so heartily sick of this form of gambling, that it can never hope to be reinstated here in anything like its pristine vigor. Even in the Atlantic States, where it never became so wide-spread as here, it is being regarded with such distrust that the number of its votaries has fallen off largely of late.

It is to be observed, too, that Eastern investors do not submit to be imposed upon as tamely as has been the practice among us, parties there seeking redress of their grievances in the courts, which are apt to regard complaints of this kind with favor. A number of suits are now pending in that section of country, brought to recover money paid for properties known to be worthless, or of little value, some of these suits relating to transactions in stocks. Several operators, once prominent on this side of the continent, are said to be threatened with suits of this kind. It is also reported that a work of a rather sensational character is being prepared and will soon be published in New York. As this work emanates from an insider, and will make some spicy revelations touching one or two old time San Francisco operators now domiciled in New York, it promises to make a stir in mining circles. It will, also, so the story goes, tend to relieve parties on whom the odium of the State Line deal has thus far rested, of some share of that burden, and transfer the same to certain "honest miners" living on this side.

But this publishing books and going to law as a means of redressing wrongs or recovering money foolishly expended, is costly, vexatious and uncertain, and, however it may suit eastern investors, who have been wronged and robbed, has never been popular with Californians, who, when they have been taken in by stock sharps or otherwise made a bad venture, have shown themselves disposed to submit quietly rather than make open complaint, as perhaps they more generally ought to have done. The better way, however, is to avoid exposing one's self to be cheated, as one is very certain to be if he suffers himself to be enticed into taking a hand at the strap game, or dealing much in these mining shares.



THE wastage at the Mint under the present Superintendent in the coinage of $20,000,000 gold and silver during the past year was less than $1,000. This is a splendid record.

THE Cholera, which has been raging in the cities of northern Egypt, has appeared in Berlin, rendering its spread over Europe, probable.

The Forthcoming Report of the Director of the Mint.

From advance sheets of the report of H. C. Burchard, Director of the Mint for 1882, we gather the following information in regard to the product of bullion in California for that year. The output of gold amounted to $16,800,000, silver $145,000, making a total of $16,945,000, being $1,300,000 less than the product of 1881. This diminution is attributed by Mr. Burchard to a falling off in the product of the Standard mine, at Bodie, amounting to $900,000, and of the hydraulic mines, some of which were prevented from running by injunctions issued from the courts. To these causes might have been added the fact that gold mining in California has, for the past two or three years, been in a sort of transition state—foreign capital withheld and not much home capital coming in to take its place. Not this year, but next, we may look for an advance in the bullion product of the State, and which, once begun, may be expected to be kept up for a number of years thereafter.

There has been some fault found with the year's output of bullion assigned by the Mint Director to certain localities. This originated, at least in one instance, from a figure having been left out of the returns made by that official, as telegraphed on from Washington. This was in the case of Nevada county, which, as will be seen, by consulting the table we publish, is credited by the Director with $3,510,000, all that it is justly entitled to; nor do we think that any other county has just reason to complain in the premises. Were the Director of the Mint to adopt the estimates of local authorities we would be able to make a right royal exhibit of gold here in California. And it would seem that Mr. Burchard, in deference to this class of authorities, made his aggregate figures somewhat larger than those of certain very competent statisticians on this coast. Nevertheless, we are of the opinion that his returns closely approximate the production actually made, as closely, in fact, as it is possible to do. For more full and detailed information on this subject we refer the reader to the article prepared by Mr. Burchard, to be found in another column.

MODIFIED CHINESE PUMP.

Special Students at the University.

The next year's work at the University of California will begin the second week in August. The coming class, according to indications furnished by the June examinations, will be larger than for several years. The institution is now in excellent condition; some cases of discipline during the last few years have had a wholesome effect, and the moral and working quality of the students has been very satisfactory.

The question often arises as to what a young man can do at the University who has not time nor means to pursue a regular four years' course. Provision is made for such students. Those applicants of suitable age, who can pass an examination showing that they are qualified to profit by the instruction given, are allowed, under the advice of the Faculty, to make up a "Partial Course" from the essentially agricultural studies, and such other topics as may be most important in view of previous attainments. Graduate of High Schools, Academies and other institutions giving thorough drill in the usual English studies and a fair start in the natural sciences, can in two years acquire that which should be of great value to those who wish to pursue agriculture intelligently.

The privilege of being a "Special Student" of one or more subjects without a full schedule is granted only to those of mature character and age. Although these two classes of students are not candidates for degrees, they can on leaving obtain certificates showing what studies have been pursued, and with what success. Students who work in the analytical laboratories are charged for chemicals and other materials used.

Persons not members of the University may obtain permission to attend any course of lectures by application to the Faculty, or to the lecturer, giving the course.

Thus the institution is open to those who cannot avail themselves of all its benefits, and the accommodating conditions arranged by the Faculty should lead all who can to enroll themselves for the coming year.

California Pump.

The California pump is essentially a chain pump. A rectangular box, about 10x3 inches, inside measurement, and ranging from 10 to 30 feet in length, according to need, is traversed by an endless flexible, band or belt of canvas, on one side of which are securely fixed, at intervals, wooden discs, nearly as large as the inside of the box. The lower end of the box is furnished with a roller, round which the belt passes, and is immersed in the water to be raised from the pit, while the upper end delivers the water into a trough, or launder, by which it is carried away. At the upper end, the belt passes round a second roller or drum, which is made to revolve by either hand or water power.

This pump, a simple and efficient apparatus, is a modification of the Chinese pump, having been originally introduced here by that people. The principle on which it is operated belongs to them, though we have greatly improved on the original structure, which was made wholly of wood. Even the belt was composed of short pieces of board, hinged together with wooden pins.

CORRESPONDENCE.

From Vulture to Prescott, Arizona.

[From our Arizona Correspondent.]

Copper Mining.

From Vulture to Prescott there is a scope of hills and valleys of sixty miles, affording several different cattle ranges, ample room for cattle on a thousand hills, and feed for a thousand cattle to graze on one hill. The stock of cattle noticed seemed to be generally of very good grade of American stock, and the same with a few exceptions is true of the horse stock, and all having plenty of feed on the open domain.

The Securing of a Spring

Or well with water in it is securing the control of a large scope of country. Sixteen miles from Vulture over the old quartz road brings you to Wickenburg—rather where it once was—a busy, bustling little town with a forty-stamp mill and several stores, saloons and hotels. Now it is almost a deserted camp. The village smith, finding his steel and iron bars of little demand, opens a small refreshment bar for the wayfaring man. A store and postoffice and a boarding-house, and stage station with a U. S. Telegraph and supply depot, for government trains, now comprises the major portion of what used to be a very lively town. The concentration works of M. Salsbury, Supt. of Benson Smelting Co., now erecting there for operations on the old Vulture tailings, and the renewed interest taken in more thoroughly prospecting this locality will somewhat revive the town and fill some empty bonses. From Wickenburg, sixteen miles by the old wagon road, shows only rough, rolling pasture land with but one settler till you arrive at J. R. Frink's stock ranch, where are exeellent water privileges and an immense range occupied by his numerous bands of horses and cattle. Here my Pimo Daisy, by a special breach of trust, took a promenade with common, loose stock, and cost

A Three Days' Search

Before she could be captured and brought to a proper line of duty. I felt perfectly satisfied that Mr. Frink had ample scope for more than 40,000 horses to feed and fatten. Ten miles and 20 miles are common distances between these different watering springs and stock ranges.

In Skull valley are several families of farmers and stock men, and a thriving school, with a literary society, organized for literary and social improvement. One cheese dairy of 24 cows was running, finding ready sale for the cheese. The hay cut always has ready sale at good prices, either at home or at Prescott, 20 miles to the northeast, over good mountain roads.

Prescott,

The territorial capital, and county seat of Yavapai county, with a population of about 2,500, is very pleasantly located in the midst of granite hills and mountains, and surrounded with pine forests, which, with the elevation of 5,500 feet, insures abundance of cool, refreshing breezes. The city is, in all its features, American—that means regular, wide streets, kept clean; good business houses and substantial public buildings, and a mild city government. Of the business portion, the center block was left an open plaza, and now contains the county Court House, built of brick, two stories above basement, with cupola and town clock. There are five churches, a large two-story brick public school building, a dramatic and theatrical building, and halls for the fraternal societies, and a large brick used below by the Bank of Arizona, and above for territorial offices and territorial library. Many of the stores are large fireproofs, carrying very large stocks of goods. The latest improvement is the large and commodious hotel "Sherman House," erected by M. H. Sherman, a stirring territorial pioneer, and now leased by H. M. Hughes, an experienced hotel man, who places this before the public as a first-class house for tourists and families. Last Sunday the dinner tables served nearly 200 guests to a very inviting bill of fare.

But the more emphatic American feature of the city is expressed in the fact that three able and readable daily newspapers are published here, with their accompanying weeklies, and on every occasion of important news free extras are distributed promptly through the city. All of these are endeavoring to encourage and sustain the brave pioneers of our new Territory, and to let the distant lands know there are here rich grazing lands not used, where enterprise would easily develop the water for stock; that there are in these mountains vast deposits of gold, silver, copper and lead that offer ample remuneration for capital and labor expended in their development.

Too often the pioneer newspapers are not given half the credit due them.

The Whipple Post is within a mile of the city and forms quite a suburban town, adding much to the good literary society of the place, as well as to the scenrity of the multitude of scattered mining camps in this vicinity. The officers and their families are highly esteemed. The electric light is now to be dispensed to the city of Prescott as some of the most energetic citizens have a franchise for introducing the Brush and Swan lights. The climate of this portion of the Territory is very nearly perfection itself. Every day has pleasant refreshing breezes, and cool bracing temperature at night. Mining work can be pursued twelve months each year.

I very much doubt if there is an average of any better climate in any State or Territory than these mining hills of Arizona.

Asthmatic Subjects

Will here find relief. Mr. I. Miller, an old resident of Santa Barbara was, on account of asthma, obliged to leave there, and was induced to come to Arizona, and after a few days residence in Phœnix (only 1,800 feet elevation) he told me he was entirely relieved of his old trouble. So he opened up trade in that town. Some afflicted one may say: "How can I get there, or to the higher town of Prescott?" The Southern Pacific R. R. brings you to Maricopa station, either from east or west, and a splendid through line of stages lands you quickly in Prescott or any intermediate place. This stage route shows you Gila and Salt river valleys, the grandest valley farms of Arizona and some rich hill scenery, as you pass over 150 miles across the Territory. Or the Atlantic & Pacific R. R., now completed to connect with the Southern Pacific in California and Santa Fe R. R. at Albuquerque, will bring passengers for this place to Ash Fork, and a pleasant stage ride of only sixty miles to reach Prescott.

This route passes near the

Grandest Scenery of this Continent,

And ample provisions are making for tourists to enjoy these sights with safety and with very trifling additional expense. The students of geology will find in these deep gorges of the Colorado, the largest illustrated work on stratification and the crust formations of the earth. The student of astronomy, from these deep gorges can study the visible starry firmament at mid-day.

When the Colorado River R. R. bridge is completed, this road will be an important thoroughfare. Northern and middle Arizona property will be tripled and quadrupled quickly in value. This section has already caught the inspiration of success, and capital is flowing this way, and development is fast supplementing the efforts of the brave and self-denying prospectors. Capitol is building roads, and erecting mills, and lead and copper smelters, and the teams that bring in merchandise and coke are freighting bullion for back loading to the railroad.

There will be, through the assistance of competing railroads, a greater advancement in this section of Arizona within the next two years than was made in the ten previous years.

Capitalists are now using the best practical experts as explorers, and investing freely on their reports after thorough tests and examinations of properties.

The Great Opportunity to Invest

In large mining properties at present reasonable figures, from the very nature of the case cannot long exist, especially to find properties in midst of well organized and thoroughly protected society and under our own laws. There are now scattered over this belt of rich mineral deposits some few gronps of mines, that some single ledge of the group, would be ample for an extensive plant, that would pay millions in dividends. To illnstrate: The Howell Co. own a group of mines that were bought by Partridge Brothers for $35,000 of the locaters, and for good measure or as "pelon" the Belle Mine was thrown in. This Company developed the property at an expense of a few thousands and sold to the Howell Co. for $75,000; a very handsome advance on cost, but in the estimation of an expert, was no appreciable fraction of the real value of this one ledge that was then so slightly esteemed, and is now proved to be ample to run the largest reduction works in the Territory.

I speak of the situation as I see it, after spending over twenty years in mines, and am free to say I own not even the fraction of any mine or real estate in the Territory.

It seems very certain that properties most eligible and convenient for working with profit will soon be taken up by those able to hold them, as safe and permanent investments. There are many gold, silver and copper mines located and being developed within a radius of twenty-five miles of Prescott.

The Black Hills district excites the astonishment of those who visit it, and Turkey Creek district rejoices in rich horn silver that will assay over twenty thousand dollars to the ton, and promising well for continuance as they sink down on a lead of two feet, with strata of this character of free milling ore. But of this I will say more after visiting the claims, and will now notice something I have seen.

The Bonanza Copper Mines of Arizona.

The Copper Basin mines are located ten miles west of Prescott. This property, belonging to Copper Basin Copper Company, of which Colonel C. C. Bean, of Prescott, is President, and J. B. Tappan, Secretary, is composed of more than twenty distinct locations made in strict accordance with requirements of United States mining laws; each claim with not less than $500 worth of prospect work and all other requirements complied with, and the proper applications made for United States mining patents, which will issue for same in a short time.

These claims, with the water rights and requisite grounds for reduction works, covers an area of about 440 acres in the basin, thus precluding any possible collision with any other title or claim to title.

This property is now reached from Prescott by the old military road which passes directly through the basin to Fort Yuma. From the basin to A. & P. R. R. it is a direct natural, and most of the way a valley road and only fifty miles to Ash Fork depot.

The basin is located in granite and soft granite, quartzite and sandy conglomerate rocks. The higher rim rocks are of a more solid granite and porphyry. The basin is four or five miles long by one to three miles in its irregular widths. The bottom of the basin is very rough and broken up by ravines, hills and small mineral mountains, steep and precipitons, the bare rocks in many places showing the rich copper stains when a great distance from them. From a tunnel started in where was an old Indian cave with some bones and relics found, they find native soluble bluestone or sulphate of copper in large masses, and some of the bones were coppered over.

We found the soil heavily impregnated with copper salts, oxides and decrystalized or anhydrous sulphates almost everywhere, but in some places to a high working per cent, as proved by tests made by Prof. Treadwell and others. The various classes of different carbonate oxides and chloride ores are here in abundance, with frequent showing of native copper, but that which astonishes the visitor most is the sand conglomerate of richest green and blue hues assaying in copper to the high average of fourteen per cent, and sometimes showing native copper in nuggets and in connection with the red oxides. This ore is so very abundant that it would be much harder to tell where it is not than where it is. The banks of the creek bed have it in heavy mass. You ascend the bank and strike the pick in the ground and pry out a piece of soft rock, and you have this same sandy conglomerate. Tons of rich broken pieces and some nuggets of native copper have been sacked and piled up near the camp, and on other portions of the ground experienced judges of ores become entirely bewildered in attemping to estimate the value or number of tons of pay ore now above the surface and in the surface soil, and they dare not put it at less than 1,000,000 tons.

Prof. Geo. A. Treadwell, an expert in copper, assaying and metallurgy, spent some days examining and assaying from all varieties of the ore, and from eighty samples assayed, he got an average of sixteen per cent copper. From the bottom of a shaft twelve feet deep, sunk in bottom of the ravine for testing the water-flow—which is abundant in all the ravines—some heavy sulphuret ore was taken out, samples of which assayed $10 gold and $15 silver to the ton, and 24½ per cent copper. Up on the side of one of the hills, in the basin, a shaft forty-two feet deep showed a well defined ledge of rich ore, with regular increase of size and quality as the depth was increased.

A number of very interesting points and proofs of the ubiquity of the pay ore, both in and on the ground, would all simply go to enlarge the assurance that this is a copper property, destined in the near future to rival, if not equal the best that Lake Superior ever saw.

A visitor with me, representing the Chicago Furnace Manufacturing Co. of Fraser & Chalmers, a man quite familiar with copper mines, thought the "Calumet," and possibly one other Lake Superior mine could now show a greater property than this copper basin. If with only small prospect labor and that on more than

Twenty Different Claims

This will bear any comparison with one so fully developed, it is the highest commendation. The forests of excellent pine timber, for lumber, that abounds within three miles, the pines and junipers and some hard woods are near and abundant for charcoal. Coke can be delivered direct from the railroad to the basin, when teams will have freight both ways at about $25 to $27 per ton. But when the branch railroad from Ash Fork to Prescott is built there will be a large margin for profits saved from the expenses of present running.

So with all the naughtiness of the railroads in getting rich too fast, they are now a great convenience, and are

Opening Up the Mines

And actually placing the bullion markets and sources of supplies at very convenient distances. The distant invalid capitalist can conveniently visit his Arizona mines, his stock ranch or his valley, grain and fruit lands without enduring any severe trials of journey or suffocating heat, or fear murderous Indians. The miner can conveniently work within or without his mine all the year in this climate. No severe extremes of heat or cold. A short rainy season in June and July comes as a refreshment to all. I did not attempt to detail the multiplied evidences of thorough, well defined and encased ledges here opened on the various claims, for they are too many to particularize, and each seems to carry proof of being in itself a large, reliable high grade copper mine. Over $17,000 has been expended in the prospect work and patent expenses on this property.

This property has attracted the attention of many distinguished visitors, and after they have clambered up to the tops of the highest buttes in the basin, and there find the rich copper veins traced from the base up, and everywhere on the flats find the soil full of it, they seem lost to express the possibilities of such a mining property if provided with the best facilities for reduction. One visitor, and extensive observer of mines, pronounced this "the largest and most important mining estate in Arizona, and possibly in the United States."

Last December George A. Treadwell, representing an English syndicate, bonded this property for the sum of $3,500,000, which bond expires with July 1, 1883. Mr. Treadwell, generally recognized as a very safe mining engineer and expert in mines, very carefully examined this property, and, after days of testing, admitted, at least, $7,000,000 worth of ore in and above the surface soil.

It is possible that the routine work of the Land Patent Office will not be completed and papers transferred by July 1st, and this may interfere with the transferring of the property on time as specified in the bonds now on record here. Even should this negotiation entirely fall through, other capital will soon take hold of such a property.

Col. Bean and family will start for New York in a few days, carrying with them the high esteem of all their acquaintances here.

B. W. CROWELL.

Prescott, A. T., June 20, 1883.

Natural Resources.

That small portion of our county which has been partially prospected for auriferous quartz, has not only proven rich, but has natural resources for the working of its ores which are seldom mentioned by the prospector. Our mountains are covered with the tall white pine, the tough spruce, the golden tamarac, and the hardy oak, all of which can be had in abundance for the erection of mills, the timbering of tunnels, and the thousand and one uses to which timber can be applied in the workings of a mine. Every mountain gorge pours down its silvery torrent, and the clear waters are to the mill man the motive power wherewith to drive his mill. Our quartz lodes, owing to the mountainous character of the county, are easily worked, there being invariably gulches or canyons from which tunnels can be driven which will open and drain the veins hundreds of feet below the surface. Why then do not our prospectors reflect for a moment on the advantages thus bountifully given by a lavish Nature? In all of the flat or rolling country, where quartz mining is pursued, every mine, in order to be extensively and successfully worked, must first have its steam engine with which to run a mill, pump the surplus water from a mine, and hoist from its levels the pay ore and the tons of waste dirt and rock for which there is not room in the galleries below. After descending a few hundred feet the machinery required for this purpose is of such ponderous dimensions that its cost is a fortune, and before the mine is fairly opened its owners are at an expense of thousands of dollars. Here in the mountains everything is changed in that respect, and with only a nominal capital the miner can open his mine and crush the rock taken from it, at a vast deduction from the expense in less favored localities. In Montana and Idaho the amateur miner from the East, we are told, looking for a pretty location, used to erect his quartz mill out in the level plain on the banks of some grand river, and transport the ore from his mine—sometimes 30 miles distant. This kind of kid-glove mining may be very romantic, but does it pay? Our miners may wish to find suitable spots upon which to erect their mills, but we think none of them would ever go down to the valley of the Sacramento to locate a millsite, and haul their quartz from this locality, to be crushed in a mill in operation there. No, we have millsites at our door yards, and water to drive our mills with, and timber for our buildings, and what is better than all, we have veins of metalliferous ore extending through our county too vast for imagination. Where we have all these natural advantages will not this section of the country, by the appliance of a little enterprise and energy, again produce wealth as in its palmiest days?—*Sierra Tribune.*

THE OUTSIDE.—Louis Betz, who left here some six weeks ago to hunt for a new locality to locate, returned the other day. During his absence he took a trip over the Denver and Rio Grande Railroad, and visited a number of the mining towns of southwest Colorado, and, with the exception of Gunnison city, he saw none that showed the least signs of stability. At this place there are iron mines, and wealthy companies are erecting large iron and steel works. Silverton he reports as being nothing but a hurrah whisky-drinking railroad town, overrun with thieves and cut-throats. It has no foundation whatever that he could see on which to build. At Ouray they are working 20 men in one mine, and these are all the men working. There are no reduction works at Ouray, and what little ore extracted shipped to Pueblo for reduction. The people of Ouray are living on the expectations of a boom visiting them this summer. He also visited the "Red Hills," about which there are such great tales in regard to the richness of the mines floating through the country. While there he saw no mines. There were from three to six feet of snow on the ground. The mining locations are made on top of the snow, the stakes driven in the snow, and no person knows what is beneath the snow. It is the opinion of many who visited the Red Hills that when the snow melts away so will the rich mines.—*Pioche Record.*

MECHANICAL PROGRESS.

A Portable Ingot Regenerator.

We gave in these columns several months since a full description of the Gjer Soaking Pit, by the aid of which an ingot of steel may be carried from the converter through the entire process of rolling into rails or bars without reheating. This "soaking pit," however, was a very massive affair, built of brick, and stationary, being located directly by the side of the converter.

Quite recently, Mr. Jacob Reese, of Pittsburg, has patented a portable "soaking pit," or regenerator, which appears to possess quite important advantages over the Gjer pit. This new device is described as follows by the *American Manufacturer:*

This regenerator is composed of a nest of eight vertical chambers, each chamber being of such size as to admit and envelop an ingot when placed in it. The walls of these chambers are two inches thick, and the whole set of chambers is made in one piece of Bessemer steel. This shell is placed on a carriage, and is surrounded with brick or some other good non-conductor of heat. The regenerator is provided with lids to cover the cells at the top, and with openings and doors for closing them at the bottom of each cell. When it is required for use, the carriage containing it is run under a hood communicating with the furnace, the caps and doors withdrawn, and the hot gases forced through the hood down through the cells and out of their bases, until the regenerator is properly heated. It is then withdrawn, the bottom doors closed, and the caps placed upon the cells. When the ingots are removed from the molds, they are placed with their small ends down, in the cells, and the lids placed over them. When the regenerator is fully charged and hermetically closed, to exclude the air and retain the heat, it is taken to the blooming mill, and a second regenerator is run into the converting house and employed in the same manner. When the ingots are taken from the mold they are only solidified to the depth of about one half an inch, while the center is in a molten state. As the outside is too cold and the inside is much too hot to be rolled, by placing the ingots in a hot regenerator, in the space of twenty minutes, more or less, the temperature of the ingots is equalized, and they may be taken from the regenerator and rolled or hammered without the use of any reheating or consumption of fuel, and what is more important, without being burned or losing weight, by oxidation.

When an ingot is withdrawn, the lid or cap is again put on, and when the regenerator is emptied it is run back to the converting house and again filled. When an ingot is placed in the regenerator it takes up heat from the walls of the cell, and the internal heat passes to the outside of the ingot, and thus it becomes of a uniform heat, but of too high a temperature for rolling. The walls of the cell then absorb heat from the ingot, and thus the ingot is permitted to pass from the molten to the solid state more gradually and more uniformly than by the old practice. Mr. Reese claims that the steel walls of his cells will give the heat off and take it up much more rapidly than any kind of brick, and that the regenerator lined with iron or steel will last much longer than if lined with brick. So that he has a good heat conductor next to the ingot, and this is surrounded with a good non-conductor of heat. Mr. Reese claims that this invention will save labor, fuel, repairs of furnaces, sand, and waste of iron to the amount of over two dollars per ton.

A CHANCE FOR INVENTORS.—In the heavy thunder storms which occurred in various parts of the country last week the lightning manifested its well known affinity for petroleum. Three large oil tanks were struck. One of them was near Olean, in this State, another at Muncy Station, Pa., and the third in the yard of the Standard Oil Company at Communipaw, N. J. This last one had very little oil in it, and was not consumed, but the others, with their contents, were burning at the latest accounts. The attractive influence exerted by petroleum, or its vapor, which renders these great oil tanks so liable to destruction by thunderbolts, does not seem to be very well understood. If it was, we should hardly be without any efficient means of guarding such structures against lightning. The subject is well worthy of attention and study on the part of men of science. At present the safeguards are so inadequate that an oil tank is not only very likely to be destroyed by any thunder storm, but to act also as a firebrand to every building anywhere near it. The inventor who devises a method which shall afford to oil tanks absolute protection against lightning, ought to be able to make a million dollars by the invention.—*N. Y. Sun.*

DIFFUSION ENGINE.—At a recent meeting of the London Physical Society, Mr. Woodward described an experiment illustrating motion produced by diffusion. A porous reservoir of clay containing air was suspended from one end of a weighted balance beam. A glass tube projected from it below and dipped into a vessel of water. A jet of hydrogen gas was allowed to play on the outside of the reservoir, and the balance beam began to oscillate. This is an adaptation of Graham's well known experiment, and is, in fact, a diffusion engine.

Things to be Kept in Mind by Every Mechanic.

Great care should be bestowed on the hanging and care of shafting. A line of shafting should run true and smoothly without jumping or jerking. If a line runs true and the pulleys do not wobble, or the boxes exude oil, it is a real delight to a good mechanic and like "a thing of beauty a joy forever."

A mill or machine shop should be erected with a view to its permanency. The foundations should be strong and rigid and the timbers sound and well seasoned. Springing and shrinking timbers and settling walls cannot give the necessary support to machinery nor reduce friction to a minimum.

The reason of unsatisfactory running of shafting is not always its location in an improperly constructed building. The millwright is often at fault in not hanging the shafting properly.

When the shafting is properly hung and the machinery in operation, the line should be inspected every now and then and any defect which may appear remedied.

This is often found necessary with the best hung shafting in the best constructed building if the economy of power is worth looking after, for there are so many disturbing causes affecting the integrity of a line that it is impossible to depend on long continued accuracy unless constant attention is given to the condition of the shafting.

A box slightly out of line or level will absorb a large amount of oil, and yet be continually hot, waste power by unnecessary friction, besides grinding and cutting the shaft. It will always pay to attend closely to such matters.

In friction gearing no power is wasted by loss of friction, the friction itself being the means used to transmit the power, and in point of economy it exceeds belting or cogs. The driving pulleys may be made of well-seasoned wood, and the faces can be beveled so as to communicate power in any direction.

Where a friction pulley is used, the boxes and journals will not heat to any extent, as the pressure can be made uniform by an idle pulley made of wood and placed on the opposite side to counteract the pressure. This cannot be done with a belt.

INCREASED EFFICIENCY OF RAILWAYS.—Mr. Wm. P. Shinn, of New York, and formerly Vice President of the Alleghany Valley railroad, has prepared for the report of the Chief of the Bureau of Statistics, a statement upon the increased efficiency of the railroad system of the United States. His paper, which is a very interesting and valuable one, shows that on three leading railroads, viz.: the New York Central & Hudson River, New York, Lake Erie & Western, and the Pennsylvania railroad, the traffic increased during the decade ending 1880, from 2,682,603,465 ton miles in 1870, to 8,263,038,412 ton miles in 1880, or upwards of 300 per cent. The means by which this enormous increase in traffic has been secured, Mr. Shinn attributes to the following causes: First, improved track or "permanent way," including bridge superstructure. This is largely due to the adoption of steel rails. Second, additional sidings, and second, third and fourth tracks. Third, increased capacity and strict classification of locomotives. Fourth, increased capacity of freight cars. Up to 1876 the standard capacity of freight cars was 20,000 pounds, in 1877 a few were built to carry 30,000, and since 1879 the standard cars, both of the East and West, have been built to carry 40,000 pounds. Fifth, additional terminal facilities. Sixth, improved methods of signaling, embraced chiefly in the establishment of the "Block system." Seventh, running locomotives "first in, first out," and running freight trains at a higher rate of speed.

A MECHANICAL WANT.—If the builders of machines for specific purposes, says a mechanical exchange, would accurately determine the power required to drive them, and furnish this information to the purchaser, they would not only do him a favor, but would render important assistance to the science of engineering generally. With this knowledge, the providing of the proper power for projected enterprises would be greatly simplified, fewer and less costly mistakes would be made, and a better general economy of motive power result. As it is, with the exception of a few old and prominent industries, the power required to drive the different machines, and hence the total power required for a contemplated plant is, to a great extent, a matter of conjecture, so that unless the comparison can be made with a similar establishment already in operation, the probabilities are entirely against a judicious selection in the way of an engine to furnish the power.—*Age of Steel.*

THE LARGEST AGRICULTURAL MACHINE SHOP.—The most extensive agricultural machine shops in the world are at Springfield, Ohio. There are five in all. A good idea of the immense size of one workshop may be obtained by imagining a building almost 17,000 feet in length by sixty feet in width, a continuous room three miles and over in length. At each minute a completely made machine is rolled from the stocks and housed or shipped to its destination; 600 machines from sunrise to sunset—an annual production of 100,000 implements.—*Mechanical Engineer.*

SCIENTIFIC PROGRESS.

Molecular Vibrations.

No scientific doctrine is more generally believed than that of the conservation of force. The great students of nature almost universally accept it. So many old and credited theories have been overturned that advanced thinkers are prepared to see this one share such a fate. This is a possibility only; the theory is considered eminently a proved and true one.

Briefly stated it amounts to this: In the universe there is no natural power known to us that can create or destroy force. All that man can do is to transform it and change the form of its manifestations. Whenever force becomes manifest to us, we can trace it back to anterior forms. It never appears spontaneously generated, and from no origin. Heat, one form of force, can be changed into useful efforts. It is assumed to represent an intense vibration of the molecules. The minute heat vibrations of the molecules, which create impulses infinite in number, and, considering the size of the molecules, of almost infinite force, can be lengthened, and made to coalesce into a single prolonged effort. A cubic inch of water may be heated, by the combustion of carbon, until the repulsive force among its vibrating molecules has developed, and the paths of vibration have been increased to twelve times their former length. Thus steam is produced. The steam may be admitted into a cylinder, under a close-fitting piston, which it will raise until the space under the piston is of one cubic foot volume. If the steam is allowed to condense, the piston will return. The minute vibrations of the molecules, too small to be measured, or fully conceived of, have been joined together so as to produce a single wave of a foot front, it may be, and of a foot altitude. The first phase of an oscillation is represented in the rise of the piston; its descent represents the second. The motion of the piston only renders the expansion of the water into steam visible in its effects. The true transformation of power was anterior to all this. The proximate origin of the force was the combustion of the fuel.

The chemical affinity of carbon for oxygen was called upon. These two elements were made to unite. They rushed together with very great yet measured velocity. As molecule of carbon came against molecule of oxygen, it was split up into atoms, and immediately combined with the oxygen. Under the effects of the atomic concussion, the newly formed molecule of carbon dioxide started into vibration. The vibration was one of that character which affects our nerves with the sensation called heat. The myriad of vibrations was imparted to the cubic inch of water, and a measure of their amount arrived at. It came to some 2,000 foot pounds.

This, it must be remembered, is theory, and unproved except by analogy. The resemblance between the phenomena of sound and heat is very great. Both can be reflected and refracted; both can start from a center and be radiated through space, in accordance with identical laws Sound is unquestionably due to vibrations. They can be seen by the unassisted eye. Such are the vibrations of a long string or tuning fork. From the analogies between the phenomena of sound and heat, the conclusion is drawn that heat is also due to vibrations.

We reach thus a true conception of the theory. Heat vibrations are invisible. They have been invented by scientists to explain exisiting phenomena. The proof of their existence is an analogical one only; and analogy has so often failed that the whole theory is provisional. The probability of the existence of the vibrations is founded on their capability to explain known facts. As soon as a discordance is shown they must be abandoned by the theorizer. As soon as such discordance between their existence and the phenomena of nature is shown, the proof and probability of their existence vanishes.

The weakness of any attempt to seek among molecular vibrations for a new source of force is thus very evident. They serve only to illustrate the possibility of the mutual transformation of different kinds of force. They are not absolutely known to exist, and may at any time be discredited, and a new theory be adopted. To take such an unproved and unknown quantity as a reservoir of new and hitherto undiscovered power is going beyond the bounds of analogy or probability.—*Cor. Scientific American.*

FILTERING DISTILLED WATER.—Eiselt recommends the use of sponge for filtering distilled water. The filtration goes on with great rapidity, and the product is clear as crystal. When filtered through paper, distilled water soon exhibits a felty sediment, which is never formed when filtered through sponge, so that the bottles scarcely need cleaning after several months' use. The apparatus that he employs consists of a bottle with an opening near the bottom from which descends a bent glass tube. This tube is about 6 inches long and 1 or 1½ inches in diameter; at each end is a perforated rubber stopper bearing a narrower glass tube. The wide tube contains one or two long strips of fine sponge that has been cleaned with dilute hydrochloric acid and then dried. The bottle to which this filter is attached must not be larger than the one placed beneath to catch the filtrate. The sponge, of course, must be cleaned every few months.

CONVERSION OF NEBULÆ INTO STARS.—The whole range of astronomy presents no speculations which have attracted more attention than the celebrated nebular hypotheses of Herschel and of Laplace. We shall first enunciate these speculations, and then we shall attempt to indicate how far they seem to be warranted by the actual state of scientific knowledge. In one of his most memorable papers, Sir William Herschel presents us with a summary of his observations on the nebulæ, arranged in such a manner as to suggest his theory of the gradual transmutation of nebulæ into stars. He first shows us that there are regions in the heavens where a faint diffused nebulosity is all that can be detected by the telescope. There are other nebulæ in which a nucleus can be just discerned; others again in which the nucleus is easily seen; and still others where the nucleus is a brilliant, star-like point. The transition from an object of this kind to a nebulous star is very natural, while the nebulous stars pass into the ordinary stars by a few graduated stages. It is thus possible to enumerate a series of objects, beginning at one end with the most diffused nebulosity, and ending at the other with an ordinary fixed star or group of stars. Each object in the series differs but slightly from the object just before it and just after it. It seemed to Herschel that he was thus able to view the actual changes by which masses of phosphorescent or glowing vapor became actually condensed down into stars.—*Popular Science Monthly.*

LIQUID GASES AND SOLID ALCOHOL.—M. Cailetet, a French chemist, some time ago succeeded, by liquefying ethyline and causing it to boil, in producing a temperature of—105 C. (—157° F.), at which he liquefied a few gases under strong pressure, and even caused oxygen to approach the liquid state. Mr. Wroblewski, of Cracow, one of his pupils, continuing the experiments, has, by boiling liquid ethyline in a vacuum, produced a temperature of—136 C. (212.8° F.), at which sulphuret of carbon and alcohol were congealed, and oxygen and nitrogen became liquid. The changes in the form of oxygen were obtained on the 9th of April in three experiments, in which the conditions of pressure (22½ to 26½ atmospheres) and temperature were slightly, but not essentially, varied. Liquid oxygen is transparent and colorless, differing in this from ozone, which is deep blue. Liquid nitrogen has a similar appearance. Sulphuret of carbon is a white solid at—116 C., but becomes liquid when raised to—110 C. At 130° alcohol assumes the form of a white solid, which becomes viscous at 129°. Carbonic oxide was liquefied under similar conditions with nitrogen.

SCINTILLATIONS OF STARS AS AFFECTED BY THE AURORA BOREALIS.—According to *Les Comptes Rendus*, M. Ch. Montigny, observing for many years at Brussels, has noticed, as previous observers have done, that the scintillation of stars is much increased during the occurrence of an aurora. He has noticed, further, that every aurora "produces immediately its effects upon the scintillation;" that stars in the north are most affected, and that the influence of the phenomenon is most marked for the stars which are observed across the upper regions of the air. Magnetic disturbances also, even when accompanied by no aurora visible at Brussels, increase the scintillation to a marked extent. On two occasions during July, 1881, the effect of magnetic disturbances was observed with no aurora visible in Brussels, or even, so far as can be learned, in any part of Denmark.

TRANSMISSION OF SOUND THROUGH ROCK. Herr F. Schell, of Grund, recently described some observations made a short time since, in the course of mining work in the Hartz mountains, on the distance through which sounds are transmitted in rock. In a horizontal direction the firing of shots at the face of a crosscut has been heard in a crosscut driven toward it, the face of which was 447 feet distant from it. A level was driven on a vein at a depth of 538 feet below the surface, and happened to strike 187 feet distant in a horizontal direction below a stamp mill dropping stamps, weighing 330 pounds. The dropping of the stamps on the surface could be distinctly heard in the heading below, which, in a direct line, the hypothenuse of a right-angled triangle, was separated by 571 feet of rock.

THE ELECTRO-MOTIVE FORCE OF BATTERIES.—Recent experiments by Mr. W. H. Preece, communicated to the Royal Society, Great Britain, show that changes of temperature do not practically affect the electro-motive force of a battery, but they do materially affect the internal resistance. Faraday's observation, that the improved current from a heated cell is due to increased conductivity, is thus confirmed. Mr. Preece's results also show that of the various forms of batteries in practical use, the Daniell is most seriously influenced by variations in temperature, and that in all experiments with that battery, either the temperature must be kept constant or frequent measurements should be taken of the internal resistance of the battery and allowance made for the variation.

PHOSPHORESCENCE IN ANIMALS.—According to Radziszewsky, the luminous animals, like *Pelagia noctiluca, Beroe ovatus*, etc., owe this fact to a peculiar fat that they contain. These little animals do not give light when at rest, but when stimulated give a quick flash of monochromatic light resembling lightning.

PAUPER Irish immigrants are coming into the nited States by way of Canada.

Mining Share Market.

Wobbling to the extent of one or two short bits per share, the stock market during the week has held the even tenor of its way. How or by what process life is kept in an institution so nearly inanimate, it is hard to divine. But, we suppose it is, as the poet tells us, because "hope springs eternal in the human breast" and because there are those, as Hudibras says, "who think the pleasure is as great in being cheated as to cheat;" and so between the sanguine and the simple, enough sustenance is contributed to keep the wheels of this juggernaut moving. Touching the condition of the market and the subtle ways of the stock angler, the *Daily Report* of July 12th, holds the following pertinent language: "With the exception of Alta, which is apparently being manipulated for a deal, the market was quiet after the adjournment of the Board yesterday afternoon, and did not look as promising as earlier in the day. A column might be written daily on the variations in prices, the gossip of the street and the hopes and the fears of speculators, and some of our contemporaries do publish that amount of so-called stock matter. But while operations are so light in the market and real facts are not obtainable, it is a fraud on the public to publish elaborate stock articles. Several recent movements in the market have been made with the assistance of mercenary newspapers, and in each case the people, the luckless outsiders, have been fleeced. The manipulation of Union Con., for instance, has been conducted with the aid of one or more newspapers, as every observing operator on the street well knows. We give the news as it comes, state the facts as they are, and are not controlled by bulls or bears."

Bullion Shipments.

Mt. Diablo, June 28th, $9,429; Contention, July 5th, $17,800; Ramshorn, 5th, $15,148; Tintic, 5th, $10,594; Turrill, 5th, $2,269; Ontario, 5th, $4,333; Horn Silver, 5th, $9,000; Ontario, 6th, $8,180; Horn Silver, 6th, $12,000.

OAKLAND BAG FACTORY.—The Oakland *Times* says that the promised revival of the jute mill in East Oakland is under way. The work of cleaning up the looms, of which there are 122, besides other branches of machinery, was commenced last Monday. In addition to this, a new brick building, one story high, with a frontage of eighty-five feet on East Eleventh street, and a depth of sixty feet, to be used as a store-house, will be commenced this week. A large frame addition will be made to the east wing of the main building for the reception of new machinery from the East and San Francisco, amounting to about $3,000, with the addition of a new patent sewing machine of Mr. Kohler, of Oakland. The boilers are to receive an overhauling, a new smokestack, and the addition of a brick wall. The amount of money to be expended in improvements will reach several thousands of dollars. A new system is to be inaugurated in the mills, under the efficient management of Superintendent John Robertson, formerly superintendent of the jute mills at San Quentin. Mr. Robertson offers employment to boys and girls from the ages of ten years and upwards; and favorable chances will be given them to make good wages. Chinese are not wanted, but it is probable that only a few will be employed to do certain grades of work.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CONSOLIDATED.—*Dispatch*, July 7: The Plymouth, Empire and Pacific mines have been consolidated under the name of the Plymouth Consolidated Gold Mining Company. Capital stock $5,000,000, divided into shares of $50 each.

CLOSED FOR A TIME.—The Scatom company's mill closes down this week, but the company will continue to sink in the old shaft. The mill will probably be stopped for a month or so.

Fresno.

HOPES FOR A BOOM.—*Expositor*, June 30: The news from the mining districts in this county is of an encouraging character, and from all appearances there will soon be a boom here. There are undoubtedly some of the richest mines in the State located in Fresno. All that is required is capital and intelligent energy to develop them.

AT SWEDE GULCH.—The Hawk-eye quartz mill is completed and is running on quartz from the Hawk-eye mine on Swede gulch. The mill runs as smoothly as a watch, and the quartz, we are led to believe, will yield handsomely; this will add more life as well as prosperity to our little burg.

A BIG ENTERPRISE.—Col. Defrees is negotiating with a French Co. for the sale of the Quartz Mountain mine in the sum of $200,000, one of the company, Marcellus Fache, with a mining engineer from France, and other experts from Oakland, were up a few days since looking at the property, and say they find everything as well as they expected. They took samples of ore from various places on the mine and returned to San Francisco to make tests, and if the assays are as good as they think they will be, they will buy the mine and commence work immediately cutting a ditch and building a flume from the south fork of the north fork of the San Joaquin river, a distance of 23 miles, with a capacity of 3,000 inches of water, and erect a 120 stamp mill. This will require an outlay of about $400,000, and if properly done and managed, this will be as good a piece of mining property as any in the State.

Inyo.

GOOD YIELD.—*Independent*, June 30: Messrs. Baker, Barnes and Keyes, of the Elgin mine, were in town during the week with 24¾ ounces of fine retorted gold, the result of working 33¾ tons of ore in their new arastra. Considering that this first run was somewhat experimental, it makes a good showing, especially as the mine looks as though it will supply all the ore they want indefinitely.

Kern.

GOLIC DUST.—*Californian*, July 7: Dr. Donnelly was here last Saturday bringing a large quantity of gold dust from his Oak Tree mine at Long Tom, which he is now engaged in developing. He thinks the district remarkably rich and extensive and that the best mines are yet waiting to be uncovered by fortunate prospectors.

Mono.

MAY LUNDY.—Homer *Index*, June 30: This mine is adding to its reputation as the richest gold mine in California. The ore is not only of a very high grade, but the gold extracted is of much finer quality, and is worth several dollars per ounce more than that taken from any other quartz mine of note in the State. The mine is in excellent condition, the mill is kept going day and night and the bullion shipments are regular and heavy.

BUNKER HILL.—"This is one of the most promising mines at the south end of Tioga district. It is situated about 400 ft west of and parallel to the Golden Crown (of the Mount Gibbs group), and, like many of the mines of that section, runs from carbonate to black sulphuret ore at depth. The shaft, now 26 ft deep, has already passed into a rich black sulphuret of silver, giving assays all the way from a fair milling grade up to $3,300 to the ton.

GORILLA.—Some delay was caused by the non-arrivals of track-iron for the tramway, but it is believed the transportation of ore from the mine to the reduction works will begin to-day. The reduction works have been put in thorough repair, and the mine has been opened on a comprehensive scale and has a large quantity of ore in sight, and a successful run may be expected.

IN BRIEF.—The landslide that carried away a section of the water ditch of the Virginia Creek Hydraulic Co., above Old Mono, caused greater damage and a longer suspension of mining operations than was expected. Wm. L. Callahan, Recorder of Jordan district, and others, left on Saturday last to prospect for placer diggings and quartz in Convict canyon, on the south side of Long valley. Negotiations are in progress for the employment of a large force of men in the placer fields of the Lee Vining Creek Hydraulic Mining Association. A great deal of prospecting and development work is now being carried on in the south end of Tioga and in Prescott district. The Mono Lake Hydraulic Mining Co., is working steadily and washing away a great deal of gravel. The Great Sierra tunnel in Tioga is still idle, awaiting repairs to the machinery.

MEN EMPLOYED.—The following men were employed in the Standard mine during the past week: Ninety miners, 18 carmen, 4 laborers, 3 watchmen, 3 station tenders, 3 firemen, 4 tramwaymen, 3 blacksmith's helpers and 1 woodman, at $4 per day; 2 ore-sorters at $3.50 per day; 3 blacksmiths, 5 engineers, 5 carpenters, 1 ropeman, 1 boiler maker, 3 brakemen and 2 shift bosses at $5 per day; 1 chief engineer, 1 blacksmith, 1 pumpman and 1 carpenter at $6 per day; 1 foreman at $250 per month, and 1 clerk.

STANDARD CON.—Bodie *Free Press*, July 10: During the past week there was extracted and shipped to the mills 1,243 tons of ore. The bullion shipment was valued at $30,883.61. The east crosscut, 1200 level, is in 359 ft; progress during the week, 19 ft, with no change to note in the character of the rock cut through. North drift No. 1, 1000 level, is 215 ft in length, where the vein is 1½ ft wide. South drift No. 2 is in from the main east crosscut 165 ft; progress for the week 13 ft. The vein in the face is 5 ft wide and looks well. Upraise No. 1 from this drift has reached a hight of 50 ft; progress 15 ft. The vein is 4 ft wide. The west crosscut from the north drift, 700 level, has been driven since last report 12 ft, and is in 336 ft. The rock is hard. The south drift from west crosscut No. 1 is in 159 ft; progress for the week 14 ft. The vein is 3 ft wide. South drift No. 2,385 level, is in 639 ft; progress 17 ft; vein 5 ft wide. North drift No. 2 has been extended 248 ft, where the vein is 8 ft in width. The upraise from south drift No. 2 was advanced 14 ft during the past week; total hight 219 ft. At this point the vein is 4 ft wide. Upraise from north drift No. 1 is up 185 ft. The vein is 3 ft wide. The stopes are all looking well.

BULWER CON.—The west crosscut from the north drift, 700 level, was advanced during the week 12 ft, total length 336 ft. The ground is hard. South drift from west crosscut No. 1, 500 level, is in 140 ft; progress 14 ft. There is 2 ft of vein matter in the face.

BODIE TUNNEL.—Work in this mine is progressing favorably. The indications are encouraging. The mill will be started up at no distant day for a protracted run.

SYNDICATE.—Ore extraction continues and the mill is kept fully supplied. There are no particular changes to note.

Nevada.

GOOD YIELD.—*Transcript*, July 4: A clean-up of 11 loads of quartz from the Hartery mine made at Sothern's custom mill, gave $45 per load. This rock was taken as an average from the pile hauled to the mill, of which there are 60 more loads on the ground equally good. The ledge in the Hartery mine is now strong, about four ft in width, and of excellent quality. The mine is being worked by the bondholders, who feel much encouraged by their prospects.

WILL USE WATER.—The example of the Idaho mine, in introducing water power for milling, hoisting and pumping, will be generally followed up by the mining companies of Grass Valley district, judging from the talk of owners but the change will be made gradually.

GOOD FOR PROSPECTORS.—The breaking of the English dam, having swept away the huge boulders and ripped things up generally on the Middle Yuba for many miles below the site of the dam, there will be a fair chance for prospectors to make discoveries of gravel diggings in the bars and channels of the stream. There are many interesting spots along the river just below Milton, which will now, doubtless, be closely examined, provided the piles of boulders that filled the channel have been swept away.

NEW YORK HILL.—Grass Valley *Tidings*, July 10: There is good rock now coming out of the shaft at New York Hill mine. Mr. Barnard McGrath, foreman of the mine, had a box filled with specimen rock, which he showed to our reporter, and the rock was sufficiently valuable to merit a special deposit in the company's vault.

Placer.

DEBRIS DAM.—*Herald*, July 7: E. C. Uren and his son Simon, of Dutch Flat, after carefully examining the channel of Bear river with a view to ascertaining the best site for building on that stream, a retaining dam, have fixed upon a point just above the mouth of Wolf Creek, and north of Auburn. Here the gorge is narrow and the storing capacity afforded by the spreading of the bed above would be very great. A dam at this point 75 ft high would only be about 120 ft long at the top, and as the necessary material is abundant, it could be built at much less cost than at almost any other point on the river. That a dam will be commenced here within a few weeks after he shall have made his report, Mr. Uren seemed to think more than probable. The miners, on the Bear river watershed, including those of Dutch Flat, and those of several smaller mining districts in Nevada county, are working together in this matter, and have in contemplation the erection of a dam this summer of sufficient dimensions at least to demonstrate the practicability of the damming system as a means of protection to the exposed portions of the valley.

THE GOLDEN FLEECE GRAVEL MINE. After tunneling over 2,000 ft the owners of this property have struck a fine prospect of gravel and are now fitting up preparatory to working the mine systematically and extensively. They have just completed a large boarding house, and are going to work on their dump. This mine is located on the Iowa Hill divide about eight miles above Damascus, and gives promise of proving a very valuable property.

San Benito.

SILVER PROSPECTS.—*Advance*, July 6. Silver ore having been found in the San Cabilan mountains and a number of claims located, a mining district called the Phillips, has been formed there, with Porter Phillips as Recorder, a petition has been forwarded for the appointment of F. DeLanza as Deputy Mineral Surveyor. The district adjoins Carr's and Grogan's grants. The prospects are considered very good and who knows but what another Almaden or New Idria may be discovered?

San Bernardino.

BORAX.—*Print*, June 30: Work on the borax claims in East Calico, recently purchased by Coleman & Co., has been progressing ever since the company obtained possession of the property. Several men are employed in taking out borax. The deposits that are being opened up are large and of a high grade. A building 14x40 ft is to be erected on one of the claims in a few days. It is not yet decided how soon reduction works will be built for manufacturing the borax.

BULLION SHIPMENTS.—The bullion output from the Bonanza King mine at Providence last month was $70,000. This month it will be about $65,000. The total yield of bullion from the mine from January 1st to June 1st is $301,451.92. The bullion shipped from the Pioneer and Oriental mills since our last report amounts to $7,373. Mr. M. Carey, superintendent of the Ibex mine, brought in $3,311 worth of bullion from that mine yesterday. About $10,000 in bullion was shipped from the Oro Grande mill this week, being the result of a week's run on Silver King ore. About $6,000 worth of bullion was shipped from the Waterman mine this week.

HOLCOMB VALLEY.—Mr. John Haley, the present owner of the English Co.'s works and quartz mill in Holcomb valley, will soon place the mill in running operation and commence work on his different mining properties in that locality. Owing to a system of "freeze out," these mines have lain idle for a long time, but it is hoped that work will again commence

and the place assume the appearance of a thriving mining camp.

OFF FOR THE PLACERS.—Messrs. Sullivan, White and Henderson have gone out to the placer gold mines at the foot of old Baldy. They are about the San Gabriel and San Antonio gulches and report the prospects booming.

Sierra.

VARIOUS MINING ITEMS.—*Tribune*, July 5: The Bald Mountain Extension Company of Forest City, cleaned up 98 ounces of gold last week as a result of one week's run on gravel taken from the South Fork ground. Van Gerson & Hill recently worked two tons of ore, from their ledge in Slug Canyon, that paid a little over $17 per ton. Indications favor their opening out a good mine. Mr. Lamping is preparing to start up the mill at the Primrose mine in Hog Canyon. This mine yielded a couple of hundred thousand dollars, when it was worked a number of years ago, and there is considerable good milling ore in sight now. Last Monday Dr. Sawyer brought down a fine lot of gold from the 1001 drift mine. It is heavy lead gold. The company employs ten men. Fifty-eight ounces of gold was the result of the last week's washing at the Extension drift mine. The pump has been started up at the Pliocene shaft by the Extension company. They will now have an abundant supply of water for washing gravel. The supply of water is getting a little low at the Ruby drift mine.

NEVADA.

Washoe District.

SUTRO TUNNEL.—*Enterprise*, July 5: During week ending July 1st, repairman have cleaned out debris accumulated during the extension of the new 60 to; also removed old drain boxes, disconnecting 370 ft of pipe lying parallel with the track, relayed some 370 ft of track taken up while cutting drain, placed boxes in drain, put down switch, removed sets of old timbers, put up five new posts and two caps in place of the old ones removed from point 18,-714, and made some slight repairs on boxes in the north lateral tunnel, where 30 ft of drain have been excavated. In shaft No. 2 have turned off fly-wheel preparatory to running engine for hoisting water—also, eased behind timbers of shaft and repaired cage guides. The flow of water is equal to 8,032,700 gallons per 24 hours. The following temperatures were observed: Entrance tunnel, air 112°, water 120°. Osbiston connection, air 100°, water 120°.

THE NORTH-END CROSSCUT.—The joint west crosscut on the 3000 level of the Union and Sierra Nevada mines is still being pushed ahead. The face yesterday showed more water than has yet been found, yet it did not amount to much. As the water did make its appearance in spurting streams, but merely oaked through the rock, it indicates no pressure from above. Some small seams of quartz have been cut, and the greater part of the water appears to come from about these,

HALE AND NORCROSS. *Enterprise*, July 11: The raise from the 2600 level of the Hale and Norcross was last evening up 73 ft. The rock continues dry. On the 2400 level they are now doing nothing. The winze down from that level has been pumped out. The 2500 station and drifts are now dry. The winze below the 2500 level has been pumped out to the depth of 25 ft. As they are now so near connecting and as better progress can be made in working upward than downward, they will not sink in the bottom of the winze. Should they now begin blasting above it would endanger the men in the upraise. The connection will probably be made in five or six days. The winze below the 2600 level was last evening down 55 ft. Next week active operations will be resumed in all the middle mines, as the much-desired air connection will be made the first of the week.

Bernice District.

NEW MILL.—*Reveille*, July 3: Five stamps in the new mill in this district has been started and the dropping of the others will follow in a few days. There is considerable activity among the miners, the mill affording them an opportunity of realizing from their ledges. There is considerable ore accumulated on the dumps of the various mines.

WILL START UP.—The trouble about title to the Brem mine, Midas flat, having been settled, the mill there has resumed operations and the mine will now be worked for all that is in it, and we are confident that it will prove a success.

AFTER MANY YEARS.—The mill at Ophir has been running steadily for several months past turning out regular shipments of bullion. The ore, which is taken from the old dumps, was several years ago thrown away as worthless. Last week a few men were set to work in the mine and they took out several tons of rock that milled $50 per ton. The mill closed down on the 30th ultimo to make necessary repairs but dropped stamps again on the fifth.

WANTED.—A custom mill is badly needed in Union Mining district. Chloriders can take out considerable ore that would pay them well if they could get it worked in the district, but it will not pay to ship to Austin or Salt Lake.

QUARTZ DISCOVERIES.—*Sentinel*, July 6: A quartz lode that promises to pay has lately been found near Wilderville. A quartz vein near Willow springs is being tested. Wm. Griffin, of Wilderville was in town this week. He has found a new quartz ledge in that vicinity recently which he thinks will pay well if the necessary machinery is put on. For the first time water has got so low at A. W. Sturgis' drifting claim on Jackass creek that he has been compelled to suspend for the season. Supt. Ennis of the Sterling mine says water has failed so fast during the warm weather, that cleaning up has commenced considerably earlier than usual. The run was short, but will no doubt prove a good one.

Columbus District.

NORTHERN BELLE.—According to the recent report of this company, about sixty tons of ore are being extracted and sent to the mills daily. Both mills are running steadily and doing good work. The crushing for the Great Western mine has been completed, and mill No. 2 is now engaged entirely upon the company's ore. The bullion shipments amounted to $14,161.25 for the week ending June 28, and aggregate $41,778.09 on June account to the same date.

Eureka District.

EUREKA CON.—*Sentinel*, July 4: The drift from the new shaft is in 15 ft. In a few days Mr. Read, the Superintendent, calculates that from 30 to 40 ft will be made daily, and this may possibly be increased to 50 when drifting has got under full headway. The sump at the bottom of the 1200 level, from which the drift runs, has been all timbered up and finished. There is nothing else in the working of sufficient importance to deserve special mention.

EUREKA TUNNEL.—Gen. Connor states that there is no truth in the story that the Eureka Tunnel is to be worked by tributers. He says he has no idea how such a report could have been started. The mine looks splendid; with the fine ore bodies in sight there can be no reason to think of giving it up to tributers.

Garfield District.

VARIOUS MINES.—*True Fissure*, July 7: The leading mines of this district are looking well. The Atherton is opened by two tunnels, one 300 and one 400 ft in length, in both of which there is a large body of high grade ore exposed, and ready for extraction whenever the owners see fit to get it out for milling. The Great Western is another good property, the best poor man's mine in this district. It has paid steadily from the grass roots down, the ore averaging $250 to the ton. It is all picking ground, not an ounce of powder having ever been used in taking out the ore. The Lancashire is another ore producer, also a poor man's mine. The Henly mine, next in importance, is owned by parties in Dayton, who are working three men. Prospects are fair for developing a good body of ore. The Blue Light copper mine in the southeastern part of the district, has produced several thousand tons of splendid copper ore, but for several months past there has been no work done on it. The John & McDonald mines are lying idle. They have had a checkered career, and from appearance there is no likelihood of any work being done there for some time. Miners seeking employment, better keep away from this place, as there are only twenty-four men working for wages, and no show from the present outlook for times to improve.

Ploche District.

MEADOW VALLEY.—*Sentinel*, June 30: The ore now being extracted from this mine has greatly improved the last week. The miners estimate the improvement at $20 per ton. The company could work the ledge and make it pay a big profit. Fifty or sixty men placed to work in the mine would help out wonderfully these dull times. The lower workings of the Day mine continue to improve as work progresses. A large body of ore is now exposed. May she keep up her lick. A 90-pound bar of bullion was cast last Saturday at the tailing mill at the lower end of town the result of six days' run. The boilers that were first put in the mill leaked so that they had to be taken out, and new ones are now being put in.

Pyramid District.

THE JONES AND KINKEAD. *Reno Gazette*, June 30: The air compressor for this mine, situated near Pyramid Lake, came down to-day from Virginia, and will be taken to the mine to-morrow. After it is set up, sixty days will complete the tunnel. Then the anxious stock-holders will know all.

Safford District.

SHIPPING ORES TO SALT LAKE.—*Express*, July 7: After thorough inquiry we are able to give the necessary information concerning the rates charged for shipping and reducing Safford ores at Salt Lake, which will show clearly the reasons for not being able to work them in this section of the country, or at Eureka, as we had at first suggested. In conversation with Mr. Mather, the manager of the Salt Lake furnaces, who is at present sojourning here, he informs us that he pays the full assay value for all ores, deducting only $12 a ton for working charges and $8.25 for transportation from the dumps to Safford, making $20.25 the total charge for hauling and reducing. Consequently, ore assaying but $26 per ton would net the owners $4.75, making it available and profitable to ship ores of a very low grade. Mr. Mather explains by saying that our ores carry so much iron that they are desirable for smelting Utah ores, which alone would make them worth something, even though they did not carry much silver. In the light of these facts it should induce our miners to develop their properties, as the district abounds in low-grade ores which, under the above rates, can be shipped to Utah at a handsome profit. Ores of a high grade are treated in the same manner, a ton of $300 ore not costing any more to ship and reduce than a ton of an inferior quality. When it is taken into consideration that furnaces in this section pay but 67 per cent of the assay value, besides charging $12 per ton for reduction, not counting the transportation rates, it is not to be wondered at that ores are shipped to Salt Lake city, a distance of nearly 400 miles, and worked cheaper than at home.

Taylor District.

MONITOR MINE.—They have sunk on the ledge 130 ft. There are two ft of ore at the bottom of this shaft that worked an average of over $100. It looks splendid and is going down at an angle of about 66°.

Tuscarora District.

WORKS BURNED.—The hoisting works of the Grand Prize & Argenta company at Tuscarora, were destroyed by fire on the evening of June 29. Sage brush was used in firing up and a spark ignited the pile in the boiler room during the temporary absence of the fireman. On his return the entire room was in a blaze and soon the entire structure was in flames. Al Griffin, the engineer on duty, hoisted over two men who were on the 300 ft level while the roof was blazing. Six men below that level escaped by coming up an old shaft. It will require $30,000 to replace the machinery and structure. Insurance $10,000.

White Pine District.

THE EBERHARDT.—*News*, July 7: We are informed that Capt. Drake, of the Eberhardt tunnel, has had another $100,000 placed at his disposal by his company to carry on the work of exploration in Treasure Hill. He will shortly start up the burleighs again. A persevering company is that same Eberhardt. The Konigsberg mine, is looking finely and promises well for the future. Mr. Jacobson, the owner, is now in Eureka with a shipment of rich ore. The Smoky mill is running steadily. Several of its working force quit this week, owing, it is said, to the unsatisfactory rate of wages paid. The ore teams are making their regular trips from the Hill, and will have all they can do till the season closes.

ARIZONA.

VARIOUS MINES.—Mojave *Miner*, June 30: Work is being actively prosecuted on the Paymaster and New London mines, near Corbat.—The El Dorado near Gold Basin, on the mines near Sherwin's peak, where they are extracting considerable ore—on the mines near Chloride, where they have a four ft ledge of galena ore. Sherman, Smith & Co. will have two or three tons of ore from their new find sampled at the Keystone mill during the coming week. This is free milling ore and the mine being only half a mile from the mill it can be worked there to better advantage than by shipping it. Robert D'Yhr is working on the Oro Fino and has a fine streak of pay ore in sight. Johnny Kennedy and P. Hach have struck water in their shaft on the Black Warrior mine at Stockton. The tunnel on the Eva mine at Stockton is now in 75 ft and is close to the ledge. At the Keystone mine, Globe district, work is now being prosecuted on the 150 level, whence a large quantity of ore is being extracted. At this place the ore vein is some five ft wide averaging probably $90 to the ton. From this level the air shaft is being sunk to connect with the 200 level. It has already been sunk about 20 ft, leaving some 30 ft more to sink before the lower level is reached. When that is done there will be about 30 ft of drifting to be done to connect with the 200 level with the shaft. When all this is done perfect ventilation will be secured for the 200 level. In sinking the shaft two parallel streaks of rich ore have been encountered, each averaging about six inches in width. Samples of the ore from this place assay between $400 and $500, the ore being very rich in ruby and antimonial silver. The Silver King Co. are building an office at the mine. They are sinking the main shaft and are striking for 1000 ft; they are now making a station at 800 ft.

COLORADO.

DIVERS MINES.—*Register-Call*: An assay of ore from the Garfield mine in Lake district, considered to be an average sample of 16 inches of crevice matter, 69 ounces silver per ton. The Garfield is in the same belt of veins as the Mascotte and south of the Williams. The Waterman mill will start up next week on Legal Tender ore. This mine under the Waterman lease, is developing into a first-class property, as the amount and quality of the ore which is being taken out shows up to the utmost satisfaction of both lessors and lessees. The Native Silver mine at Caribou was sold last Saturday to Joseph Lloyd for $8,823.35, and the mill was bid in by Mr. Buckingham for $4,465.03. Both are cheap as dirt. Now the mine and mill should both be started up under practical management. Since work was resumed on the Bull-of-the-Woods the crevice of iron about two inches in thickness, has widened out to over 16 inches of solid mineral, the full width of the crevice matter between walls being over three ft. The mineral is a bluish sulphuret, and prospects well. A mill and smelting run will be made next week. A large number of prospectors are in camp at Hot Sulpher Springs, waiting to get into Carbonate. The bridges are swept away and the streams are too much swollen to ford them. The rich strike recently made at Irwin, in the Gunnison country, proves the remarkable richness of the field around the Forest Queen property. The new discovery is on the north extention of the Forest Queen, has a vein 18 inches in width and was made at the bottom of a shaft 36 ft deep. Mill superintendent Lewis deposited last evening at the First National Bank, this city, 244.39 ounces of gold retort cleaned up from the California Mine Co.'s stamps in Black Hawk. A portion of this came from the Kent county mine, one of the mills of the company have been employed in crushing for the Kent Co, since the accident on the California some days ago. The gold has a currency valuation of $3,509.

IDAHO.

CHANCE TO INVEST.—*World*, July 3: The Elmira Co. have got to the line of the Silver Chief claim, at a depth of 300 ft, and the vein shows up beyond all expectation. This is a grand opening for capitalists—probably the best in the Territory, and it is now held at a very reasonable figure. The Chinese Co. working Sam White's drifting ground on the shares washed up the other day. The clean-up was very good. We don't know the exact figures but it amounted to several thousand dollars. The company has been at work on this run since last November.

ANOTHER RUSH.—There is almost as much excitement 12 miles this way from Sheep mountain as at the latter place, over recent discoveries of an immense free gold quartz district of free milling gold ore, and large numbers of prospectors are now exploring and locating claims there.

GOOD RESULTS.—The recent clean-up at the Elk Horn mill, report says was $8,000, the result of a few weeks' run on Pride of Idaho ore. The mill has only five stamps.

AT PHILLIPSBURG.—The Algonquin mill started up a few days ago on Granite mountain ore, and thus far the results are quite equal to the most sanguine expectations of interested parties. The Hope is not doing so well. Nevertheless, the mill keeps pounding away.

SHEEP MOUNTAIN.—There are now about 100 men in this district and more going in daily. Some good discoveries have been made of rich galena deposits and many claims located.

FROM THE BASIN.—In this locality the Gold Hill Co. is working a force of about 80 men in and about the mine and mill. Developments on the 400 level and in the western extension continue to be satisfactory, and the usual amount of work is being done. This is one of the most remarkable mines on the coast, both as regards permanent richness and skillful management. With mill, hoisting works and every needed facility on the largest scale, yet the company disburse large amounts monthly, and all so quietly as scarcely to give any sign of its existence.

MONTANA.

THE MOULTON.—*Inter-Mountain*, July 8: Everything is looking well at this mine. In the 200 foot west drift, which is being actively forwarded, a very fine vein has been struck which improves as the drift progresses. This drift is on the middle or main ledge. On the 300 foot level on the south vein a winze to the level below has been started which has attained a depth 50 ft showing good ore all the way down. It is at present three ft wide in the bottom and assays by sample $75 per ton. The mill continues well supplied with ore.

DEER LODGE.—The Anaconda smelters will be put up at this place, notwithstanding reports to the contrary. They will also be of much greater capacity than originally projected.

GREGORY. *Inter-Mountain*, July 7: The Gregory mine, deservedly ranks as the richest silver-lead mine on the east side and is only excelled in the Territory by the properties of the Hecla Co. The Gregory is a big mine in any country. It will soon be in order for Butte to ship out a trainload of bullion. Our weekly shipments at present far exceed the Helena consignment in value. If the Lexington, for instance, was to store its product for even six months, it could load a car with bullion of more than four times the value of the Helena shipment because the Lexington is now producing $100,000 per month. Butte is now producing and shipping bullion matter and ore at the rate of $200,000 per week.

NEW MEXICO.

COAL. *Southwest Sentinel*: Some three months ago Pedro Marquez discovered a thin seam of coal on his ranch three miles north of Silver City. Not being able himself to explore the deposit he has since obtained aid from other parties to enable him to do so; the article having been tested with satisfactory results, an incline has been run in on one of the seams which has opened out to a thickness of over four inches at the face of the drift—12 ft from the point where first opened. There is no question as to the character of the coal. It is first-class bituminous and a sack full of it may be seen at Black's planing mill. Further, there can be but little doubt that the seam will open to a width which will insure profitable working—and that Silver City may look for an entire revolution in the matter of fuel.

COPPER DEPOSITS.—But little work is being done now in Hanover district for two reasons: First, the new strike at Fleming drew many of the miners and prospectors to that place; secondly, the copper market has been so low for the past few week, that parties owning copper mines have suspended work, awaiting a rise in that metal. This camp is one of the most promising and best developed in the county. It is a large district, extending over an extensive area of country, and the facilities for cheap mining are unexcelled. Among the more promising claims are the Albion, the James Fair belonging to Hutchison and Shanley; the Iron King and '81, the Contention, the Chamberlain and Bennett group, and the Willis mines. Hutchison and Shanley have two tunnels driven in on the Jim Fair, one 162 ft long, and the other 58. The upper tunnel is being driven through an immense body of good paying copper ore, carrying magnetic iron and white spar—sufficient for fluxing purposes. The '81 is furnishing ore for the smelters at San Jose, and it is said is yielding well. There are large bodies of silver carbonate ore being unearthed in this camp running from $25 to $250 per ton. The district is well watered, good roads leading from there in all directions, and the grading cannot be excelled anywhere. Kingston mines are looming up and the Las Vegas parties who are interested in that flourishing mining camp, will make considerable, from their investments.

OREGON.

NORTH PACIFIC COMPANY.—*Oregonian*, July 7: This company has secured the services of J. L. Hoey an experienced mill man from California, who is busy overhauling their mill preparatory to starting up again and who thinks he can successfully handle this ore. The kinds of base metal in the rock are not many. There is magnetic and manganese iron, some little pyrites of iron and soap stone. The latter is the worst substance the owners have to contend with. It has to be neutralized by some means to warrant success in working the ore. An experienced miner understands the kind of acid that will free the pulp from the effects of the soap stone. The mill has shut down until the new arrangements for better work can be supplied, which will take a week or ten days to get them in place. The gold is in the rock and all that is needed is to work it out and save it. William Elliott returned to the Swank a few days ago from Ingall's creek. He could not do anything there on account of snow. He says he will prosecute his searches in that quarter in about three weeks, when he thinks the snow will have disappeared. Ingall's creek runs through a very deep and narrow canyon, and the divide between Nigger creek and Ingall's is somewhere near 7,000 ft high. Hence the snow at this late period. A piece of gold weighing 23 ounces was picked up in a claim at Pocahontas, eight miles west of Baker City.

UTAH.

TINTIC DISTRICT.—*Tribune*, July 8: The mining outlook here is good, with the exception of the Mammoth property, which is lying idle, not from any fault of the mine, but from bad management. The Eureka mine is turning out about 30 tons of ore per day, which is being shipped to Colorado to be smelted. The Beck is working about 20 men; the property is looking fair, and the output is regular. Messrs. Smith and Martin have taken charge of the Red Bird Con. at Eureka, and are putting in fine steam hoisting works, one of the best yet erected in the district. These men it is supposed have made a good strike in the property. The Park has a concentrator at work. The gangue or waste from this mine is very soft and easily washes away, leaving the concentrates in the form of lead ore very rich in silver. The old Chicago has a good strike on it, lately made in the well defined ledge which runs about 100 ounces in silver. The Northern Spy is supplying the Tintic mill with ore, is doing a good business, and has a steady output. Those interested in Tintic mines are satisfied with the condition of their properties in general, while they regret that the Mammoth is not among the producers of bullion.

ITEMS.—The Germania White Lead Works are turning out their regular quota of lead, and making steady shipments. Preparations are going on at the works for manufacturing various colors of paint, and they expect soon to be able to supply the West with excellent colors. Dry Canyon and Ophir mines are shipping some fine looking ore to the sampling works in this city. The mines of Bingham are sending down their usual quantity of ore, and much active development is going on in that district. The bullion receipts continue to increase, and the mines are reported as looking better in all the leading districts of the Territory.

Metallurgy of Nickel.

We have from time to time recorded the success of the efforts made abroad in the manufacture of pure nickel, and the progress made in securing new applications for it. As foreign experimenters have taken much pains to keep their aspirations and their results before the public, it has been the impression of all but a few who had special opportunity to inform themselves that the credit for the results achieved was due chiefly, if not exclusively, to those who have labored in this field in Germany and in France. It is the merit of Prof. W. P. Blake, of New Haven, to have come forward to correct that opinion; and while giving full credit for good work done by others, he has directed attention to the fact that Mr. Joseph Wharton, of Camden, N. J., was in reality the first to produce pure nickel in a malleable state and in considerable quantities. Professor Blake exhibited a remarkable series of specimens at the Boston meeting of the mining engineers; and from the paper read on that occasion, we take the following interesting data:

Inasmuch as nickel first became known commercially in the industrial arts in the form of an alloy, there were no special attempts to produce the metal in a state of extreme purity. The nickel-silver of commerce answered all the existing demands, and was, of course, much easier to make and cheaper than pure nickel. It found a large and rapidly extending consumption as a substitute for silver spoons and forks, and for silverware generally, especially when the new art of electro-plating was developed by Spencer, Smee, and others. The nickel-silver was specially well adapted to receive and hold the deposit of silver, and it is to this day the most desirable alloy for plating.

The use of nickel alloy for small or subsidiary coins next made an increased demand for nickel. Tentative efforts were made by Dr. Feutchtwanger, in New York, in the year 1837, and he actually issued many one cent and three cent pieces, made of a nickel alloy, the exact composition of which he was careful not to state, but called it "Feuchtwanger's Composition." Switzerland began using nickel alloy coins in 1850; the United States in 1857, though sample coins, one cent pieces, had been made by Prof. James C. Booth, at Philadelphia, in 1853, the prepared alloy containing from five of nickel and ninety-five of copper to as high as thirty of nickel and 70 of copper. The alloy adopted by law consisted of twelve of nickel and eighty-eight of copper. The five cent pieces now in circulation are made of an alloy of twenty-five parts of nickel and seventy-five parts of copper. In 1860, Belgium adopted an alloy of the same proportions, for small coins. Other countries have followed, until the use of nickel alloy for small coins may be said to be almost universal in the chief commercial countries. Up to June 30, 1876, the United States had alone issued of the five cent nickel to the extent of $6,716,129 in value. Another sudden demand for a larger supply of nickel sprang up when the art of depositing nickel by electricity was perfected. The many and increasing applications of this art need not be here enumerated. It is sufficient to state that, at the present time, they constitute a large part of the present consumption of the metal in this country, where the art may be said to have originated in a successful, practical form.

Nickel ore is more generally distributed throughout the mineral-bearing portions of the United States than is generally supposed. It is commonly associated with chrome ores from Canada to Maryland on the Atlantic side, and equally with the chrome ores of the Pacific slope, notably in Oregon. It is also a common associate of magnetic pyrites in the Archæan rocks, being found in Litchfield county, in Connecticut; in the Highlands of the Hudson, in New York and in New Jersey; and specially at Lancaster Gap, in Pennsylvania, where the chief supply of nickel has been obtained for the United States. This ore yields from one and one-half to two per cent. of nickel, but is enriched by smelting at the mine into a matte containing 10 per cent or more of the metal. This locality was worked some 30 years ago by Prof. James C. Booth and others, of Philadelphia and some nickel alloy was made. Some 10 years later, Mr. Joseph Wharton purchased the works and established the industry at Camden, N. J., opposite Philadelphia, where it has since been carried forward.

A large portion of the metal produced at these works by Mr. Wharton, has been used at the United States Mint for the subsidiary small coins, and a considerable amount has been exported. Since the developing of nickeling by galvanism, a large part of the product has been put into the form of nickel salts and anodes.

But Mr. Wharton, not being content with the production of impure nickel, early began experimenting to determine whether nickel could not be produced in a pure and malleable condition, susceptible of being worked in nearly the same manner as iron, and of being applied in the manufacture of various objects, requiring strength of material and a material that cannot be easily oxidized. One of his earliest experiments was to take the somewhat spongy mass got by reduction of the oxide of nickel, and, after heating it to full redness, work it under a steam-hammer into a bar.

In 1873, Mr. Wharton sent to the Vienna Exhibition a sample of nickel in the form of axles and axle-bearings, and at the exhibition in Philadelphia in 1876, he exhibited a remarkable series of objects made of wrought nickel, such as bars, rods, a cube, a horseshoe magnet, and magnetic needles of forged nickel. These did not excite the interest to which they were entitled as a remarkable advance in the working of this little known metal. The exhibit did not cause much comment, and it was not specially described or reported upon, so far as I am aware, except by the judges who reported the exhibit to the Commission as worthy of an award in the following terms: "A fine collection of nickel ores from Lancaster county, Pa., with nickel-matte, metallic nickel in grains and cubes, and manufactured nickel, both cast and wrought; nickel magnets and magnetic needles, cast cobalt, electro-plating with nickel and cobalt, and salts and oxides of both these metals, the whole showing a remarkable degree of progress in their metallurgical treatment."

Some of the same objects formed of wrought nickel were sent over to Paris two years later, and were exhibited in the American section in 1878. There, as in Philadelphia, they did not at first excite any surprise or receive any special attention. Very few persons realized what the objects really were, and that they were very different from alloys of nickel. In fact, very few chemists had ever seen nickel. Pure nickel was a rarity, a curiosity, just as samples of indium or thallium are to-day.

You can then, perhaps, imagine the incredulity of the expert chemists and metallurgists of Europe, when whole ingots and forged bars of metal and numerous finished articles of pure wrought nickel, without alloy, were offered for inspection. These articles not differing greatly in their appearance from the higher grades of nickel alloys, or from electro-nickel objects, they passed them without surprise. No previous exhibition had been so rich in exhibits of the use of nickel and in the products from them. The influx of the pure carbonated and oxidized ores from New Caledonia had greatly stimulated the nickel industry in Europe, and had improved the quality of the alloys of nickel. New companies had been formed to manufacture nickel-silver and to produce nickel from these superior ores at a lower cost than had before been possible. Christofle, of Paris, had just erected extensive works at St. Denis, and had made a most brilliant display of his products in one of the main avenues of the exposition. The Vivians, of Swansea, and other exhibitors, had large cases filled with beautiful objects of hollow and solid ware made of nickel-silver. Amid these various exhibits of striking *tours de force*, the modest little show-case from the United States with examples of manufactures of *pure wrought nickel*, not alloy, could hardly be expected to excite attention and win the golden award, which was most cheerfully accorded as soon as the fact was demonstrated by analysis that the objects were really of the pure metal. Some of the objects now shown were at that exhibition, and have retained their brilliant polish and luster unimpaired. These notable advances in the metallurgy of nickel, made with the lean and sulphuretted ores of Lancaster Gap, prepared the way for greater advances.

Dr Fleitmann, of Iserlohn, Westphalia, Prussia, has improved and cheapened the operation of refining the nickel and toughening it, and has reduced the liability to the presence of blow-holes in castings by adding to the molten charge, in the pot, when ready to pour, a very small quantity of magnesium. This is immediately decomposed, magnesia is formed, and graphite is separated. It would seem that the magnesium decomposes the occluded carbonic oxide, or reduces it to a minimum. The magnesium must be added with great care, and in small portions, as it unites explosively with the charge. It is stirred in. About one ounce of magnesium is sufficient for sixty pounds of nickel. From three-quarters of an ounce to fifty-four pounds of metal have been used with success by Mr. Wharton. The nickel from the ore at Lancaster gap seems not to require as much as the foreign metal. It is to be noted that complete malleability of nickel was obtained at Wharton's works in Camden, before Fleitmann's invention or process, but this last is more rapid and better than the old method. The metal so treated becomes remarkably tough and malleable, and may be rolled into sheets and drawn into wire. Cast plates can be successfully rolled. The cast plates, such as are made for anodes, after reheating, are rolled down to the desired thickness. It is found that it is a great improvement to the nickel anode plates to roll them down. They dissolve with greater uniformity in the bath. Nickel so treated with magnesium has been rolled into sheets as thin as paper. Expensive works for rolling the metal have been erected by Mr. Wharton at Camden. There is already a train of forty-inch rolls, eighteen inches in diameter, with annealing ovens and gas furnaces and their adjuncts, and a ninety horse-power engine. At present, this mill, as well as the works for producing the metal, and the mine also, are "shut down." The largest sheet yet rolled at Camden is seventy-two inches long and twenty-four inches wide, of pure nickel.

Dr. Fleitmann has also succeeded in welding sheet nickel upon iron and upon steel plates, so as to coat them equally on each face with a layer of nickel. The quantity preferred by weight is eight-tenths iron and two-tenths nickel, one-tenth of nickel being placed on each surface. To secure union, the iron or steel must be perfectly flat and clean. A pile is made with outer facings of sheet-iron to protect the nickel from scaling. When the whole is heated to the proper degree, it is passed through the rolls. The two metals become so firmly united that they may afterward be rolled down two or three together, or separately, to the thinness desired.—*Engineering and Mining Journal.*

Mineral Resources of Colombia.

The notes on the Central Provinces of Colombia, recently read before the Geographical Society by Mr. R. B. White, contain a large amount of information interesting not only to the shareholders in the Frontino and Bolivia Company, but to all who have capital embarked in Colombian enterprise.

The State of Antioquia, although it may be generally looked upon as a great table land, is broken up by some very deep valleys. That of the river Arma is 5,000 feet in depth, and marks the line of a great east and west fracture, and the river Porce, which runs in a valley even deeper than the preceding, follows a north and south line. The general elevation of most of the country in Antioquia is 6,000 feet above the sea, and it may be considered as the highlands of this part of Colombia. A great deal of information has been published respecting the lower Atrato, particularly in connection with projected interoceanic canals. The upper portions of this great valley, with their relatively healthy climate and fertile lands, are accessible by steamer from the Atlantic ocean, and can also be easily placed in communication with the interior and more populated parts of Colombia.

At first sight, the enormous trees in these dense forests would lead one to suppose that they must be of immense age; but a comparison with the vegetation which has sprung up on what are undoubtedly

Old Spanish Mine Workings,

Dating no further back than the year 1600, convinces one that the greater part of these forests are not more than 200 or 300 years old, and probably at the time of the Spanish conquest, there must have existed here vast tracts of open country, filled with Indian population, occupying themselves in agriculture and general industry. At present there is only a bad mule track from Onibdo, on the Atrato to Bolivar, but there are no obstacles to the construction of a good road or even of a railroad.

In the northern part of the State of Antioquia

The River Cauca,

Before joining the Magdalena, receives the waters of the Nechi and the Porce. These rivers and the extensive region surrounding their junction are of great interest. Ranges of low hills, dying away in extensive plains, which are not, however, as a rule, swampy, are the characteristics of this district. The climate is hot, but not unhealthy, in the sense in which the term is usually applied to hot and low-lying tropical districts. The lazy negro race of the coast has no tendency to spread inland, and the mountaineer from Antioquia has no liking for a hot climate. The Spaniards found this region was called Zenufana, or "Land of Gold." A great Indian road, probably connecting Bogota, the capital of the Zipa, with the Zenu and Darien kingdoms, and ultimately with Central America, traversed the country. The first Spanish "conquistadores" found immense wealth amongst the Indians, who must have been very numerous. The Indians worked the gold mines, both alluvial and quartz, with which the whole country abounds, and they continued to work them under the direction of the Spaniards. The greater part appear to have been of a low grade of civilization, but the artistic work in gold and pottery which is found in some parts, would seem to indicate that the majority of the tribes were more or less savage tributaries of more advanced races.

The Frontino and Bolivia, and one or two other

English Companies,

Are working gold quartz mines in this region with good results. Other mines, both alluvial and quartz, are worked in a rude way by the natives, and the total produce amounts to about 70,000 ounces per annum. Coal is abundant on the banks of the Nechi and Cauca, and the seams are favorably placed for working. Of the population of the State of Antioquia about 15,000 are professionally engaged in gold mining, and the agricultural produce obtained by the hard labor of the rest of the inhabitants only just suffices for their wants. The Spaniards attempted to colonize this part after having successfully entered the country via the Darien and the Sinu, but their early colonies were destroyed by the Indians, and amongst them the first city of Santa Fe de Antioquia, which was afterwards rebuilt where it now stands.

The Enormous Riches of this Region

Are matters of history. The headwaters of the rivers San Jorge, Sinu, Leon and Rio Sucio run through an elevated country, fertile and healthy. The San Juan valley is to the south province of the Choco what the Atrato is to the north. The region is interesting on account of its vegetable products and the rich alluvial gold deposits of the San Juan basin. In making a journey from Buenaventura up the San Juan to Novita, one meets with no evidences of civilization. The present town of Novita, the capital of the province, is quite modern. The old town, which was about two miles away, was abandoned when the slaves were set free and its rich mines could be no longer worked. The western face of the Torre hill is a horseshoe-shaped amphitheater, which, sloping down in the first place from the head of the mountain for a distance of half a mile or so, terminates in an abrupt precipice; also of a semi-circular form, over which hundreds of streams, which collect their waters on the upper slopes of the hill, fall in silver threads to a sheer depth of over 3,000 feet, and collect together at the bottom, forming the river Surama, whose sources have been previously incorrectly marked as being on the eastern flank of the Torra mountain. Nearly the whole of the distance traversed from Novita, as well as the mountain itself, abounded in auriferous quartz lodes, and the greater part of the streams showed prospects of gold in the alluviums. Much of the country, at an elevation of 3,000 to 4,000 feet above the sea, is healthy and suitable for agriculture, and the schistose rocks, which are its principal characteristic, are not by any means unfavorable to the fertility of the soil. It would be quite practicable to open road communication with the river Tamana, and if sufficient capital were employed an important mining center, assisted by agricultural establishments for the supply of provisions, might here be formed.

A very large proportion of the

Platinum

Produced in the world is obtained from the upper San Juan. If the workings were systematically carried on a much larger quantity might be extracted. Its price in Novita is about 12s. per ounce troy. The bed of the river San Juan and its principal tributaries must contain a large quantity of gold. Concessions have recently been granted for working these rivers, and Mr. White has no doubt that success will attend the operations if properly and practically carried out. The Patia is the only river north of the line, which, after traversing extensive valleys to the east (or inside of) the western cordillera of the Andes, breaks through this mountain range and finds its way to the Pacific.

The strait of Minama is in itself quite a remarkable feature in the Patia valley. The river Patia at this point drains a wide area of country, and receives an abundant supply of water from the snowy ranges of the central Andes; its volume is many times greater than that of the Thames at Richmond. The river, before entering the strait, comes to rest in an immense pool, surrounded by cliffs of slate rock, from which it finds an exit through a cleft which is not more than twelve feet wide, and through which the water moves with a barely perceptible current. This fissure, therefore, must be of great depth. Coal of excellent quality is abundant throughout the upper Patia valley. Copper mines are found near San Pablo. The river Patia itself is rich in gold, and in the dry season the negroes wash out a considerable quantity. The route by which travelers usually enter the country is by way of the port of Barranquilla, at the mouth of the Magdalena river. Steamers run up the river as far as Honda, and at Nare the road to the interior of Antioquia branches off. Five days' journey from Nare on mule back brings the traveler to Medellin, and this route is certainly the right one to follow if the State of Antioquia is to be visited. A railway is in course of construction by Mr. Cisneros from Puerto Berrio on the Magdalena to Medellin, but only about thirty miles have been opened, and the rest of the route is traversed by a mule road about as long as that from Nare. The port of Buenaventura, on the Pacific coast, is called at twice a month by the English steamers from Panama. A good mule road leads from the port to Cali, in the Cauca valley, and a railroad is being constructed also by Mr. Cisneros, following more or less the same line. From Buenaventura to Cordoba, a distance of twelve miles, the railway is now open, and at the latter place mules have to be hired. A day and a half's riding brings one to Cali, and from this city any part of the State of Cauca may be reached by mule roads.

In estimating the practical importance of those districts of Colombia, of which Mr. White's paper treats, it should be borne in mind that Colombia is, with the exception of Chili, the best governed of the South American republics. Property is thoroughly respected, the laws are fairly administered, foreigners are welcomed and protected, and every inducement is held out to attract foreign capital.

CRYSTALLIZATION OF WROUGHT IRON.—A correspondent of *Science* writes: "An iron contractor told me the other day that he was called as an expert in a case where the wrought iron strap of the walking beam of a steamboat broke and injured some one. The broken strap (about four by eight inches, I think,) was shown, and the interior found to be very badly crystallized—the worst case, my friend said, he ever saw. The exterior was of fair, ordinary texture. Afterwards, a part of the strap was cut off, sawn lengthwise into bars, and tested for tensile strength. All portions were rather weak, the highest resistance being but 36,000 pounds, but the inner sections, where the iron was worst crystallized, were the strongest of all."

LONG STEEL PLATES.—Some long steel plates have been rolled by the Otis Iron and Steel company, of Cleveland, Ohio. The plates were 50 feet 6 inches in length when sheared, 51 inches wide in the center, and three-eighths of an inch thick, and the ingots from which they were rolled weighed 4,400 pounds each. They will be used in the construction of a large traveling crane.

THE ENGINEER.

Underground Wires.

Postmaster-General Fawcett, of England, in dwelling upon the advances made in underground telegraphy by his department, states that within a radius of any four miles of the general postoffices there are 4,388 miles of wire under ground and only 500 above ground. The same district also contains about 600 miles of underground private wires. There are thus nearly 5,000 miles of buried wires within the small area described by a four-mile radius from the London postoffice, and not one of these systems is said to interfere with another. The local telegraph system of London is probably the best in the world, and its excellence is largely due to the complete insulation of the wires. The loss from leakage is nominal, and there is no danger of interruption by the breaking of wires which, in certain localities, may at any moment be caused by a fire or by the formation of enormous icicles dragging the wires to the ground by their weight. It would appear from this that American companies are now deprived of their last refuge or excuse for filling the streets and covering the housetops with poles and wires, and i is to be hoped that measures will be taken in the near future with the view of compelling the laying of all wires in cities under ground.

It may be of interest to state that a number of men are now employed in the construction of the underground connection between Marseilles and Paris. The cable is enclosed in a cast iron pipe which is laid nearly six feet below the surface of the ground, and which, at intervals of 550 yards, is provided with cast iron boxes. The latter are so constructed that they can be readily inspected when required, thus presenting no very great difficulty in case of repairs. The cost of the whole work is estimated at about $8,000,000.

THE SUEZ CANAL.—The announcement of M. de Lesseps that he will soon commence a second canal, a return line, close to the existing route, and that all the capital, 125,000,000 francs, has been subscribed by Frenchmen, does not meet what England demands, representation in a canal, claimed to be international, not French, for herself and other maritime powers, pro rata, to their shipping passing through. In the management of the present canal, composed of thirty-three members, all are French, save three Englishmen, who are there by toleration, not by right. All the functionaries are French, and all are at the nod and beck of M. de Lesseps. The canal dispute seems to be settling down into an anti-English question, as a means of thwarting John Bull for not dividing his Egyptian gains with monsieur, who had backed out of the risks. In the administration of the existing as well as in the execution of the second canal, the watchword seems to be: "Exclude the English—the nation who holds nearly one-half of the stock and supplies by her shipping the four-fifths of the receipts."

NEW TERMS IN ELECTRIC ENGINEERING.—In following the development of electric engineering, all the world is learning new terms and new language. Words which three years ago either did not exist, or were understood only by men of science, are to-day in the common language of engineers and their workmen, to-morrow will be used by the general public. "Electro-motive force" and "current," "volts" and "amperes," are becoming terms as well known as "pressure of water" or "cubic feet of gas;" and it is necessary that this should be so, as the time is fast approaching when the public will find their quarterly bills for the supply of electricity made out in "volts" and "amperes," and will have a right to sue their local electric company if their daily supply of "current" is insufficient, or is given at a wrong "electro-motive force."

How to propel trains in tunnels is one of the mechanical or engineering problems of the day for which no very successful answer has yet been found. Ventillation even in short tunnels is exceedingly bad, and in our climate the products of combustion make the air almost stifling in certain conditions of the weather. Any method of storing power which would not occupy more space or weight than an engine and boilers, and would be able to run for eight or ten hours continuously, would be one of the most valuable inventions of the age. Even the storage battery, which entails a loss of at least fifty per cent, could be made immensely useful if it were possible to charge the battery repeatedly without injury to it.

THE GREAT NEW YORK BRIDGE, recently opened between that city and Brooklyn, is not only the largest, all things considered, but also the most expensive structure of the kind ever built. The tubular iron Victoria bridge at Montreal cost $7,000,000. The iron and steel bridge at St. Louis cost $9,000,000. The bridge from England to the Isle of Man, of tubular iron, cost about $3,000,000. There is not a stone bridge in London or Paris which cost over $4,000,000. The bridge at Omaha cost $2,000,000; the one at Bismarck the same sum. The New York and Brooklyn bridge cost about $15,000,000.

USEFUL INFORMATION.

NERVE ACTION.—Very delicate experiments have been made to determine the so-called "reaction time" in sensation—that is the time between the moment of excitation of the senses and the moment at which the person indicates by a signal that he has become conscious of the sensation. Mr. Beaunis, of Nancy, France, has recently sought to measure the reaction time for smell, or to tell how long it takes to realize the sensation of smell after the excitant of that sense has been applied to the olefactory nerves. He gives in *Comptes Rendus* a table of the numbers obtained with ten different substances. They range from thirty to seven hundredths of a second for ammonia, and forty-six for acetic acid, to sixty-three for mint, and sixty-seven for carbolic acid. In the case of musk, he was unable (notwithstanding repeated attempts) to fix precisely the moment of the smell sensation. The numbers given show that the reaction time for smelling is longer than that for touch, sight and hearing. (In the author's own case, it is shorter than for touch.) Dr. Buccola, of Turin, has recently made experiments on smell, with different apparatus, and gets results which agree in the main with those of M. Beaunis.

TURKISH CARPETS.—It may startle some of our readers to learn that "real" Turkish carpets have been made in Germany for Turkey, but such is the fact, at least if we correct the expression "Turkey," by explaining that their destination is the late Turkish province and present kingdom of Roumania. The German element predominating at that Court, the carpets for a new summer palace, Sinai, have been ordered from a Saxon firm, who for some time past have been making imitation Turkey carpets. The designs were submitted to and selected by their Roumanian Majesties, and are said to be of great splendor. One small carpet for a boudoir is in the now fashionable terra-cotta; another, 60 square yards large, for a bedroom, has a cream ground with steel blue border; while a third, 80 square yards large, and weighing 500 pounds, has a red ground with sage border, with a mixture of other colors. This sounds like carrying coals to Newcastle, but the price has no doubt decided the matter.

TO RESTORE MUSTY FLOUR.—A correspondent of *The Miller* seeks information on the above subject, and receives the following reply: We do not believe on principle in adding any foreign substance to flour, and would not advise any one to, but if our correspondent wishes to experiment, we submit the following opinion, obtained from a well informed and reliable man: "Musty flour can be restored and improved by adding three parts of carbonate of magnesia to 760 parts of flour, mixing thoroughly. Carbonate of magnesia cannot be called an adulterant. It has been specially recommended by Professor Davy, on the ground that it improves the color of new and inferior flour, and increases the yield. Dr. Hassell, however, criticises this by saying that 'neither of these results, as far as the public are concerned, are in the least desirable. The increased yield simply means more water.' Even so, if it is an improvement, it should be used by all means."

ROOFING LINEN.—A new covering material, called "roofing linen," has recently been introduced in Germany, which is about the thickness of common pasteboard, and consists of a layer of coarse linen between two layers of thin roll-paper. The cohesion of the three layers is effected by an asphalt composition of special make, called "roofing paint." It is stated that this paint should be freely applied to roofs immediately after their completion, and again about six weeks afterwards. This operation should, it would seem, be repeated every few years. The linen costs about 10d. to 11d. per square yard, and the paint 10s. to 11s. per cwt. Although this new method appears to have points which deserve commendation, a real estimate of its value cannot be formed until the material has been exposed to the test of several years' use.

SOMETHING ABOUT GLUCOSE.—A bushel of corn weighing fifty-six pounds will yield between twenty-eight and thirty pounds of glucose or grape sugar, and in adulterating sugar from eighteen to twenty per cent of the grape sugar is generally used. In Europe potatoes are generally used for the manufacture of glucose, and the manufacturers find larger profits than from corn. A plant called manioc, a native of South and Central America, is said to produce fifty-six pounds of glucose to the bushel. As this plant yields over 500 bushels per acre, it is not improbable that manioc may be the "sugar cane" of the future. The so-called Brazilian arrow root and tapioca of commerce is made from the cassava or manioc plant.

GOOD LEATHER POLISH.—A German journal gives the following leather polish: Mix 200 parts of shellac with 1,000 of spirit—95 per cent—in a well stoppered bottle. Keep in a warm place for two or three days, shaking frequently. Separately dissolve 25 parts of Marseilles soap in 375 of warm spirit—25 per cent—and to the solution add 40 of glycerine. Shake well and mix with the shellac solution. To the mixture add five parts of nigrossin dissolved in 125 of spirit. Well close the vessel and shake energetically, and then leave the mixture in a warm place for a fortnight.

COPPER OR IRON FOR BREWING COPPERS.—According to the *Engineer* (London) there is a strong prejudice in England against the use of any metal but copper in the construction of brewing coppers. On the continent they are often made of iron. It is thought by some that the use of the latter is liable to impart a dark color to the worts, but such, says the *Engineer*, is not the case, for the tannic acid of the hops at once forms a coating of insoluble tannate of iron, which protects the metal from oxidation, and analyses made of worts boiled in iron prove that they do not contain more iron than worts boiled in copper vessels contain of copper; in fact, says the *Brewers' Guardian*, unless copper is kept absolutely clean, it soon corrodes and dissolves to an appreciable extent in a slightly acid fluid like beer wort.

A LOST ART DISCOVERED (?).—A technical exchange says: The art of making Vasa Murrhina, the famous glass work of Egyptian or Tyrian origin, which was lost for 2,000 years, has at last been discovered, and this glass is now being made and introduced as centers for decoration and for panels, tiles, etc. In the restoration of this lost art, we have a decorating material which, from its adaptability and beauty will be much sought for. This revival, which commenced at Murara, has spread to this country, and it is understood that a factory for the manufacture of this glass is to be started in Chicago.

BRICK OF CORK.—At the Nuremberg exhibition was shown a novel use of bricks of corks. These bricks have only been used for building purposes on account of their lightness and isolating properties, but they are also employed as a covering for boilers, and are said to excel even asbestos in preventing the radiation of heat. They are stated to be very cheap, being prepared of small corks, refuse and isolating cement. At Nuremberg, the application of cork bricks was largely shown. The usual size of cork bricks is $10x4\frac{1}{2}x2\frac{1}{2}$ inches.

ASPHALT BRICKS.—Bricks impregnated at a high temperature with asphalt are being successfully used in Berlin for street pavement. By driving out the air and water the bricks will take up fifteen or twenty per cent of bitumen, and the porous, brittle material becomes durable and elastic under pressure. The bricks are then put endways on beton bed and with hot tar. The pavement has been laid down in a part of a thoroughfare where neither granite nor compressed asphalt had hitherto withstood the wear.

GOOD HEALTH.

One Cause of Railroad Accidents.

The most carefully compiled statistics inform us that about 1,400 railroad employes are killed in this country every year, and from 8,000 to to 10,000 more or less injured. This great sacrifice of human life is not, as might at first thought be surmised, caused principally by the frequent collisions or derailment of trains, but by accidents in making up and handling trains at stations. The loss is nearly all confined to brakemen or station train helpers; and the opinion is expressed by good railroad authority, that a very large portion of these accidents might be avoided by improved, or rather uniform methods of constructing cars.

It is a very general impression that system and uniformity is the prevailing rule in that portion of practical mechanics, which relates to car construction, but such is not the fact. From a circular issued by the secretary of the Master Car Builders' Association it appears that the very opposite of uniformity is the rule among car builders for railroad companies. The master car builder of the Boston and Albany railroad says he has forty different kinds of brake heads and shoes, eleven of journal boxes, thirty-seven journal bearings, ten cast iron and five or six wrought iron draw bars, eight or ten different draw bar side castings, and a multitude of various other different parts of a car. The master car builder of the Baltimore and Ohio road reports sixty-five different kinds of journal bearings, and in eleven other articles in common use varieties numbering from twenty-five to six. And similar reports have been sent from other railroad authorities.

This is a singular exhibit, and it would seem almost that human perversity and not mere chance, or individual convenience, had produced this wide and confusing diversity of construction. It is a matter which may well challenge careful inquiry, not only of the association referred to, but of the general public as well.

TRICHINÆ.—J. E. Morris, M. D., in the *Clinical Brief*, says, in regard to trichinæ in swine, that it is a well established fact that the real source of infection in swine lies entirely in the rat. A committee of Vienna physicians found in Moravia thirty-seven per cent of rats examined trichinous; in Vienna and its environs ten per cent, and in Lower Austria about four per cent. The well known voracity of the hog, and its special fondness for meat, cause it to feed upon the flesh and excrements of other animals infested with these parasites, and especially rats and mice. To prevent trichinous swine it is highly important to cut off all the sources of disease in the diet of these animals.

Power of the Imagination.

That imagination may prove fatal, receives fresh proof from "a case of fatal shock from supposed snake bite," reported in the *Medical Press*, April 25, 1883, by Dr. C. R. Francis. The patient, awakened from his sleep by something creeping over his naked legs, immediately jumped to the conclusion that it was a cobra, went into a state of collapse and died, though it was discovered, even before death, that the supposed cobra was a harmless lizard. There is no doubt but that a very large portion of the sickness and death of adults might be warded off by a proper and determined exercise of the will power.

A late number of *Hall's Journal of Health*, in dwelling upon this subject, remarks as follows: To regain or recover health, persons should be relieved from all anxiety concerning diseases. The mind has power over the body. For a person to think he has a disease will often produce that disease. This we see effected when the mind is intensely concentrated upon the disease of another. It is found in the hospital that surgeons and physicians who make a specialty of certain diseases are liable to die of it themselves, and the mental power is so great that sometimes people die of diseases which they only have in imagination. We have seen a person seasick in anticipation of a voyage before reaching the vessel. We have known a person to die of cancer in the stomach when he had no cancer or any other mortal disease. A blindfolded man slightly pricked in the arm, has fainted and died from believing that he was bleeding to death. Therefore, well persons, to remain well, should be cheerful and happy, and sick persons should have their attention drawn as much as possible from themselves. It is by their faith men are saved, and it is by their faith that men die. If he wills not to die, he can often live in spite of disease, and if he has little or no attachment for life, he will slip away as easily as a child will fall asleep. Men live by their souls and not by their bodies. Their bodies have no life by themselves; they are only resources of life—tenements of their souls. The will has much to do in continuing the physical occupancy or giving it up.

The Nature of Consumption.

If a green bush is pulled up by the roots, and these roots are cut off close to the body of the bush, a good general idea may be had of the "air passages," if the bush is turned upside down, or the top to the earth. The end of the bush next to the ground will then represent the part of the throat where the voice organs are, the body of the bush the windpipe, the branches the bronchial tubes, and the leaves the lungs themselves; and as the leaves cover the branches from sight, so the lungs, which are nothing more than little bladders distended with air, hide the bronchial tubes. Here, then, are four distinct parts of a great apparatus, each different in locality, and each locality the subject of a distinct disease, requiring different remedies and a different treatment. Liquid guano destroys the leaf, but gives life to the roots. Water does but little good if thrown over a tree, but saves it from dying if thrown on the ground about it. So what would benefit one part of the air passage might be wholly unavailing if applied to another part. What would cure a disease of the windpipe might destroy the lungs, or be perfectly useless. Thus showing how important it is to know certainly what the disease is, and where it is located, in reference to the great fountain of life, the breathing apparatus.—*Journal of Health.*

HEREDITARY DISEASE.—There is, strictly speaking, no such thing as hereditary disease. Children are not born diseased, however (some specific maladies excepted) much one or both parents are, but they are simply born with a *predisposition* to such parental malady. They are born with the material, with the producing cause, perhaps, but actual disease will no more occur unless exciting causes are applied, than powder would detonate without the aid of fire. The observant reader has often felt surprised at seeing robust, hearty children, of parents who were seemingly at not a great remove from the grave, and if rational care were taken of such children they would live to become healthy men and women. The practical lesson should be a hopeful diligence in the rearing of children of diseased parentage. The difference between the children of healthy and diseased parents amounts to this: As to the latter, they have less capability of resisting the causes of disease, the consequence is a greater necessity for carefulness; this necessity is often felt, and practically attended to; the result is, that such persons are found living, scores of years after those have moldered in the grave, who, in priding themselves on having constitutions which nothing could hurt, could not be made to feel the need of carefulness, and, consequently, perished long before their prime.

A RECENT cough will almost always yield to the following treatment within two or three days: Mix in a bottle four ounces of glycerine, two ounces of alcohol, two ounces of water, two grains of morphine. Shake well. Dose for an adult, one to two teaspoonfuls every two or three hours. Half this quantity to children from ten to fifteen years. It is not safe to give it to infants or children under ten years of age.

SAN FRANCISCO:
Saturday Morning, June 14, 1883.

TABLE OF CONTENTS.

EDITORIALS.—Stampedes and Stock Gambling; The Forthcoming Report of the Director of the Mint; Special Students at the University; California Pump, 17. Passing Events; How Shall we Make Bricks without Straw; Production of Precious Metals in California in 1882; The Deer Law; Mining Gold Nuggets, 24. A New Governor, 25.

ILLUSTRATIONS.—Modified Chinese Pump, 17. Horizontal Engine with Ball's Governor, 25.

CORRESPONDENCE.—From Vulture to Prescott, Arizona, 18.

MECHANICAL PROGRESS.—A Portable Ingot Regenerator; A Chance for Inventors; Diffusion Engine; Things to be Kept in Mind by Every Mechanic; Increased Efficiency of Railways, A Mechanical Want; The Largest Agricultural Machine Shop, 19.

SCIENTIFIC PROGRESS.—Molecular Vibrations; Filtering Distilled Water; Conversion of Nebulæ into Stars; Liquid Gases and Solid Alcohol; Scintillations of Stars as Affected by the Aurora Borealis; Transmission of Sound Through Rock; The Electro-Motive Force of Batteries; Phosphorescence in Animals, 19.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 20.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 20-1.

THE ENGINEER.—Underground Wires; The Suez Canal; New Terms in Electric Engineering, 23.

USEFUL INFORMATION.—Nerve Action; Turkish Carpets; To Restore Musty Flour; Roofing Linen; Something about Glucose; Good Leather Polish; Copper or Iron for Brewing Coppers; A Lost Art Discovered; Brick of Cork; Asphalt Bricks, 23.

GOOD HEALTH.—One Cause of Railroad Accidents; Trichinæ; Power of the Imagination; The Nature of Consumption; Hereditary Disease, 23.

NEWS IN BRIEF—On page 28 and other pages.

MISCELLANEOUS.—Natural Resources, 18. Metallurgy of Nickel; Mineral Resources of Columbia, 22.

BUSINESS ANNOUNCEMENTS.

Mining Machinery—Joshua Hendy Machine Works, S. F.
Annual Meeting—Spring Valley Water Co., S. F.
Hydraulic Machine—Hoskin Bros., Marysville, Cal.

Passing Events.

Save only such ordinary happenings as occur always and in every country, we have little of interest to place on record of the current week. On the credit side of the business ledger we have to enter many items, such as an active trade, a healthy labor market, favorable weather for maturing and gathering the great harvests of fruit and grain, good prices for our leading staples, uninterrupted public health, and a general prosperity. On the debtor side there is some little shortage of water in the mines, some shrinkage of the crops, a breath of political unrest, with the usual number of accidents, disasters and misbaps to put down. Exempt from the tornadoes, floods, pestilence, drought, and the thousand other discomforting and death-dealing agencies that afflict other peoples, we of California pursue our vocations under halcyon skies, with little to disturb or make us afraid. Multitudes of strangers are this summer visiting our State, a far larger number than ever before; the most of them coming not more to view our scenery and enjoy our climate than to escape the miseries and dangers to which they would be exposed were they to remain at home. These people travel a long way and expend much money for the sake of seeing and briefly enjoying what with us are matters of everyday life. Truly, we are in some respects a favored people.

MORE than 3,000 persons have perished by disasters on sea and land the present year.

"How Shall We Make Bricks Without Straw?"

When, in the course of weekly events, it becomes necessary for us to make up the mining summary for this paper, we sometimes experience not a little trouble in accomplishing that task. In preparing this summary we depend, as will be seen, wholly on our exchanges from the mining districts for the material wherewith to make up the same. Now, so it is, these exchanges come to us sometimes quite barren of items adapted to our purpose, leaving us no alternative but to omit from our columns any notice of mines and mining affairs in that particular locality. This is a damage to the section of country so ignored and a disappointment to us. We might, it is true, adopting the plan of some eastern journalists, draw on our imagination for matter descriptive of these mines, and so furnish to the world some entertaining reading: might reproduce, for example, and further embellish the pleasing fiction lately promulgated in that quarter about two of our noted mining magnates, John P. Jones and Alvinza Hayward—relating how the latter, while engaged in developing a gold mine, having exhausted his means, applied to Jones for assistance; whereupon something like the following colloquy took place: Jones, *loquitur*—"Well, yes, I would like to help you out, my boy, only I am myself about strapped, cleaned-out and done for; only got a little dab cached there under the hearth—not more than a million dollars or so, but you are welcome to that if it will do you any good." "Any good! well, I should rather say! But, then, I don't like to rob you of your bottom dollar and leave you tectotally dead-broke and essentially gone in." "Oh! take it old fellow—take it and pitch in. If you make a strike, good for you. If you lose it, dang the difference. Always like to 'grub-stake' an old friend when I have it in my power." *Sequel:* Alvinza, who is a hopeful, persevering chap, resumes work, strikes a bonanza of a hundred millions or more, all solid gold, which he hastens to share with his liberal friend. Jones, considering this an imputation on his generosity, rejects the offer, whereupon a duel ensues, and both parties are killed. The above account of this sad affair differs, we admit, somewhat from that given in the East. But our version is the better of the two, in that it is more highly flavored, while it adheres equally close to the facts of the case.

This, as we said, might furnish a bit of entertaining reading, at least to that class of persons abroad who have come to relish any kind of lollypop ladled out to them by Bret Harte, Sam Clemens and other writers of the sensational and Munchausen school; but its publication would hardly be fulfilling the mission of the PRESS, which is to furnish the largest amount of trustworthy information possible, in relation to the mines on this coast.

With the exception noted, these our brethren of the press do constantly much good service of one kind and another. They guard vigilantly many public interests—no week being suffered to pass but they make occasion to cudgel the bloated aristocrat, take a whack at the pauper immigrant, or go for the hated mongol in our midst. Save in the particulars mentioned, these papers do not lack variety. They discourse of all things under the sun and on it—sacred and profane, wise and otherwise. They hold forth on the origin and descent of man; give us dissertations on physical improvement, morals, politics and religion; talk about love, free and platonic, and, diving deep into the abyss of metaphysics, drag thence the most abstruse questions and subject them to a hebdomadal airing.

Now protoplasm is good, and so is muscular christianity, which latter the border clergy might, perhaps, practice to advantage, seeing a set-to with gloves might sometimes draw where pulpit eloquence fails. There is virtue in all these things, but in this age we cannot get along without the mining items. We yearn for these. Our desire is of the precious metals, mines, quartz-mills, smelters, etc. We would know how much bullion, and no more, John Smith has taken out the past week or month, as the case may be. Though often told, we like to hear the story rehearsed of the Copper Gong, the Golden Harp and the Silver Lyre. (Let the compositor be careful to spell this last word right.)

Along about the occurrence of our national holiday we did not expect much mining news through these our usual channels of information. But now that the "Fourth of Independence" is past, the crisis over, and the country safe, we indulge the hope that our cotemporaries in the mineral regions will make amends for former shortcomings; even those in the past most remiss managing to slip into their columns every week or two a few lines about the mines, the miners, the millmen, and the smelters in their vicinage. How, without the aid of these, our friends in the upper country, can we ourselves get out a good paper? How, adopting the langnage of the ancient Israelite, shall we be able to make bricks without straw?

The Deer Law.

Effort was made by the last Legislature to guard against the slaughter of the deer for their hides which has been pursued heretofore in a most wanton manner in some of the northern counties. Scores of carcasses have been reported abandoned and the slayers have pressed onward on their murderous course. It is to be hoped that the present law, aiming to prevent such outrages, will prove effective.

It will he well for the information of all who contemplate deer hunting to publish the law as it stands at present, to wit:

626 * * * Every person who, between the first day in November in each year and the first day of July in the following year, hunts, pursues, takes, kills or destroys any male deer or buck is guilty of a misdemeanor. Any person in the State of California, who has in his possession any hides or skins of any deer, elk or antelope or mountain sheep, killed between the first of November and the first of July is guilty of a misdemeanor. Every person who shall at any time in the State of California, hunt, pursue, take, kill or destroy any spotted fawn is guilty of a misdemeanor. Every person who shall take, kill or destroy any of the animals mentioned in this section at any time unless the carcass of such animal is used or preserved by the person taking or slaying it, or is sold for food, is guilty of a misdemeanor. Every person who shall buy, sell, offer for sale, transport, or have in his possession any deer from which evidence of sex has been removed or any of the aforesaid game at any time when it is unlawful to kill the same, as provided by this and subsequent sections, is guilty of a misdemeanor.

Mining Gold Nuggets.

From the Banghart mine, situate twelve miles northwest of Shasta, there was brought to this city last week a lot of gold, consisting of nuggets, weighing each a pound or more. This gold, which occurs in a crystallized form, is met with in bunches, connected by vein matter. It is broken from the containing gangue, with hammers, very little of the ore here being subjected to mill process, what is so treated being worked in arrastres. The most of the gold occurring so at intervals, renders production somewhat irregular, though, in the long run, exceedingly profitable. This mine has been worked for the past twenty years, and has yielded large annual returns. As the gold bearing formation runs clear through the mountain, it is thought profitable operations may be kept up here for an indefinite period. The mine is being worked after a manner that ought to have large following, the management being noted for economy, system, and efficiency. Mr. F. M. Stocking, the superintendent, is a careful and experienced miner, and withal a man of the greatest probity, a very important qualification in the conduct of a property like this.

Production of Precious Metals in California in 1882.*

This State has maintained the second place in the list of gold and silver-producing States and Territories. There was, however, a diminution in the yield of the precious metals of about $1,300,000 from the production of 1881.

This was largely due to a falling off of upwards of $900,000 in the production of the Standard Consolidated mine at Bodie. The gravel mines, too, yielded less, as they had not recovered from the depressing effects of litigation on the debris question, which at one time threatened not only to cripple the operations of some of the chief producing mines, but in some instances to cause a total suspension.

In sections of country where suits were pending, capital was withheld from engaging in new mining enterprises, and even the quartz mines were affected to some extent.

In the southern part of the State more activity was manifested than for some years past. Old mines were reopened and prospecting systematically conducted, with the result of discoveries of importance being made.

During the year the following dividends were paid by California companies:

COMPANIES.	Dividends.	Amounts.
Black Bear Quartz	4	$31,500
Bodie Consolidated	4	100,000
Bulwer Consolidated	12	120,000
Fresno Enterprise	1	10,000
Great Western Quicksilver	1	12,500
Idaho	12	224,750
Marguerite	1	6,250
Napa Consolidated Quicksilver	9	90,000
New York Hill	2	20,000
Pleasant Valley	6	30,000
Plumas-Eureka	2	50,800
San Francisco Copper	6	15,000
Sierra Buttes	2	14,100
Standard Consolidated	13	725,000
Totals	75	$1,449,000

This is nearly $400,000 less than was paid in seventy-two dividends in 1881.

Sixty-eight mines in fourteen counties are reported to have levied 121 assessments, and called upon the stockholders for $1,547,467, as against $2,237,850 in 1881.

I have estimated the total production of the State at $17,645,000, of which 16,800,000 is gold and $845,000 silver. This was produced by the several counties approximately as follows:

COUNTIES.	Gold.	Silver.	Total.
Alpine	$20,000	$10,000	$30,000
Amador	1,500,000		1,500,000
Butte	650,000		650,000
Calaveras	670,000		670,000
Colusa	3,000		3,000
Del Norte	80,000		80,000
El Dorado	600,000		600,000
Fresno	80,000		80,000
Humboldt	100,000		100,000
Inyo	220,000	130,000	350,000
Kern	260,000	20,000	280,000
Lassen	100,000	20,000	120,000
Los Angeles	17,000	24,000	41,000
Mariposa	250,000	4,000	254,000
Merced	10,000		10,000
Mono	2,200,000	380,000	2,580,000
Nevada	3,500,000	10,000	3,510,000
Placer	800,000		800,000
Plumas	1,250,000		1,250,000
Sacramento	400,000		400,000
San Bernardino	20,000	150,000	170,000
San Diego	100,000		100,000
San Luis Obispo	5,000		5,000
Shasta	300,000	80,000	380,000
Sierra	1,100,000		1,100,000
Siskiyou	720,000		720,000
Stanislaus	80,000	15,000	95,000
Tehama	10,000		10,000
Trinity	600,000		600,000
Tulare	5,000	2,000	7,000
Tuolumne	400,000		400,000
Yuba	750,000		750,000
Totals	$16,800,000	$845,000	$17,645,000

This estimate of the gold product of California in 1882 is nearly $1,500,000 higher than the estimate of statisticians on the Pacific coast; but after a careful revision of the reports from mines and districts, and of the statements of the amount and sources of the gold received at the San Francisco and Carson mints, I am constrained to adhere to the figures I have given.

The value of the gold coined at these mints during the year was $29,929,525, of which $2,441,956 was gold bullion belonging to the Government in those mints at the beginning of the year in excess of the amount at its close, leaving $27,487,559 coined from bullion deposited during the year.

Of the latter, $26,431 was United States gold coin, old plate, jewelry, etc., and $4,504,004 foreign gold coin and bullion. Assuming that all of the foreign gold coin and bullion imported during the year at San Francisco, amounting to $4,748,766, came to the mints and was also made into coin, there would remain $22,712,306 gold of domestic production used in the coinage, which must have been deposited at the San Francisco and the Carson mints from the States and Territories sending their bullion to these mints. From the mint records and the reports from private refiners, it appears that all of the domestic bullion received at San Francisco and Carson, except $81,776, came from the Pacific States and Territories, *i. e.*, California, Nevada, Oregon, Alaska, Arizona, Idaho, and Washington, and that these States and Territories sent to the Atlantic coast, also, gold bullion to the amount of $612,524. It is evident, therefore, that the production of the Pacific States and Territories should equal the gold bullion used in coinage that must have been received from them—$22,630,540—and the amount they sent to the Atlantic seaboard—$612,524—a total of $23,243,064. Their total production as estimated in the general table, is placed at $22,570,000, showing, if the official records are to be relied upon, that more than one-half million dollars of gold bullion was delivered at San Francisco and Carson from the Territories bordering upon the Pacific States and Territories; or that the total production of the latter during the year must have been greater, rather than less, than the amount I have credited to them.

*This statement of the production of precious metals in California is from an advance sheet of the Report of H. C. Burchard, Director of the U. S. Mint, for the year 1882.

DURABILITY OF BUILDING STONE.—To determine the value of building stone, some one grimly suggests that a meditation among the tombs is a very good thing, and a capital article on the "life" of stone used for public or private structures could not fail to be written upon what might be observed in humble village graveyards or splendid city cemeteries. In far fewer years than most people imagine, monuments erected to last to the resurrection are in ruins—before the grandsons of "the poor inhabitants below" are dead. Nature will allow just as little waste material as she can help.

THE American railroad interests in Mexico, have all been consolidated.

A New Governor.

An invention relative to steam engine governors has been made by F. Ball, of the Ball Engine Co., of Erie, Pa., which introduces what will strike most of our readers as an entirely new principle, or theory for their action. The Ball governor, instead of depending on variations in the speed of the engine for securing a general uniformity, takes an entirely new departure, and makes the variations in the load the means for regulating the speed. It is generally admitted that the theory of an engine governor of the ordinary type is defective. These governors only act when the speed changes, and, although the best of them act within exceedingly small limits, there must be certain irregularities of motion in order that they may act at all. Theoretically, the ordinary governors cannot keep an engine at a uniform speed under wide changes of load. They act only within certain limits, which are largely a matter of adjustment. Usually, if the governor is very sensitive to changes of speed, it will be unstable in its action, causing an intermittent flow of steam to the engine, if it is a throttling governor, or irregular cutting off if it is a cut off governor. It will be always "hunting," as the engineering phrase goes. Usually the adjustment is made so that as they move to increase the steam supply, they meet a constantly increasing resistance to further motion. This gives them stability of action, but makes the total change of speed between full load and entirely empty, a very considerable amount. The new theory which Mr. Ball developed in the construction of his governor is to bring about changes in the point of cut-off, or in the supply of steam, by the changes of load itself, instead of by changes in the speed of the engine. As the change of load is what causes variation in the speed of the engine, it evidently should determine the amount of steam admitted to the cylinder. This theory is eminently a rational one. The Ball Engine Co. send us the two diagrams, A and C, which we publish herewith, illustrating the action of one of these governors, and the results attained are certainly quite remarkable. Before speaking of them at length, however, the construction of the governors must be mentioned. The cuts show the form of construction used for single-valve automatics, in which the governing is affected by moving the eccentric across the shaft. To understand the application of the theory to a form of governor which at first glance is of quite a common form, a close inspection of the cuts is necessary. The pulley itself is made to form a part of the governor, and is mounted loosely on the hub of an arm which is keyed to the shaft. The fixed arm has a stud at each extremity, on which a pivoted lever is placed, shown in Figs. 1 and 3. The inner ends of these levers are attached to the weights and springs, and the outer ends are connected by links to the arm of the pulley or driving wheel, and are the means by which the wheel itself is driven. Thus it will be seen that the governor is placed between the engine and the work which is being performed, and that it not only transmits all the power, but is also constantly weighing the power transmitted. This weighing of the load is made to act directly on the steam supply through the eccentric. The weight and springs provide the necessary stability, and the resistance of the load is only introduced in sufficient quantity to correct the inherent defects of all governors depending solely on changes of speed for power to act. In external form, as we have said, the governor presents a familiar appearance. Fig. 1 is a view from the outside of the engine; Fig. 2, a view from the inside. Fig. 3 shows the inside with the eccentrics detached, while in Fig. 4 the eccentrics appear in their proper relations with the ball and socket joint. The main eccentric has an oblong shaft opening, and is suspended by a pin on an arm, giving it a pendulum-like motion backward and forth across the shaft. Mounted loosely on the shaft outside of this eccentric is a secondary eccentric, the ring of which engages a stud in the side of the main eccentric, so that as this secondary eccentric oscillates forward and backward on the shaft, the main eccentric is made to swing and thereby vary the steam supply in the usual manner. The secondary eccentric has a sleeve surrounding the shaft, projecting through the oblong hole in the shaft opening. In the end of this is screwed a nut, which covers the oblong shaft opening and keeps both the eccentrics in contact. The two weights are suspended in such a position that their centrifugal force is opposed by the spring, and the resultant of the opposing forces is transmitted through ball and socket joints to the eccentrics.

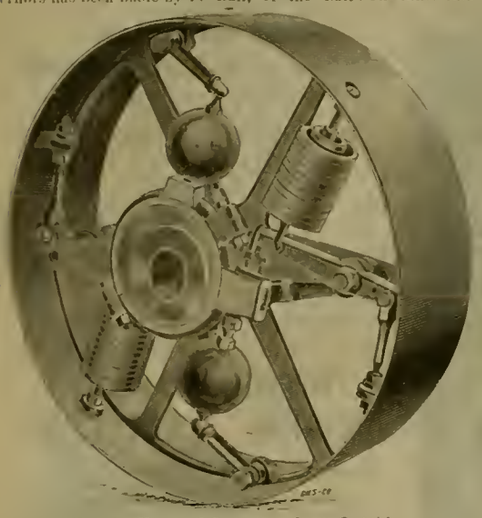

Fig. 1 View of Governor from Outside.

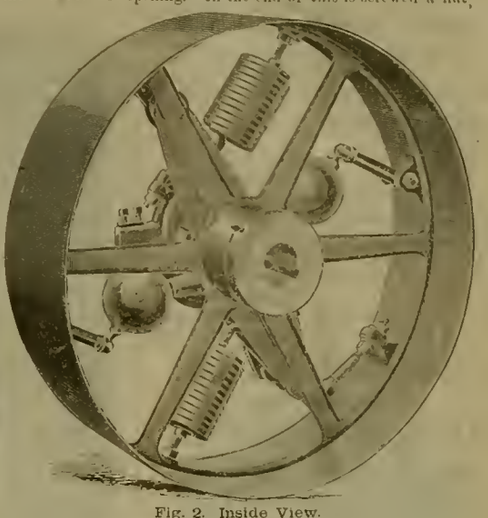

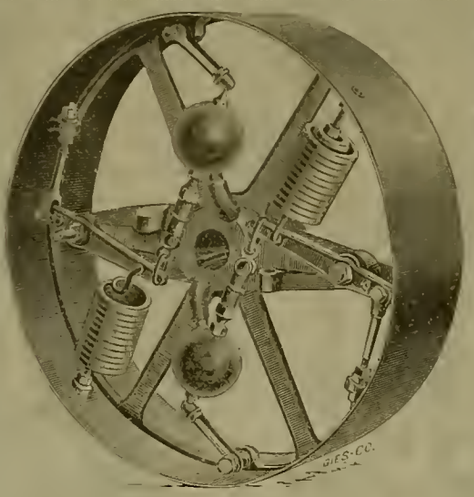

Fig. 2. Inside View.

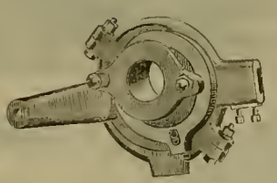

Fig. 3. Governor With Eccentrics.

The speed diagrams A and C, were taken in a rather novel manner. A weight held by a spring in the balance wheel revolved with it, and by centrifugal force, aided by gravity, vibrated in a vertical direction at each revolution. The extent of these vibrations measured the speed of the engine. Of course when the weight was over the shaft, gravity drew it toward the center, and when in the opposite direction gravity drew it from the center. This constant vibration corresponding with the revolutions is what is represented by the nearly vertical lines, the horizontal motion of the paper, which was constant, giving each line a slight inclination. A pencil attached to the weight drew the lines. The diagrams were all taken from the same engine under the same condition of load, which consisted of a wheel submerged in water, so arranged that it could be lifted out or entirely submerged without interfering with the motion of the engine. The engine itself could be controlled either by the new governor or, at pleasure, by one of the common form, which was one of the most popular in the market and highly esteemed for its excellence. Diagram A is a sample of the best work which it could produce under the widest changes of load. In each diagram, near the middle, the load was suddenly thrown on. In A, this point is clearly shown by a marked falling off in the speed.

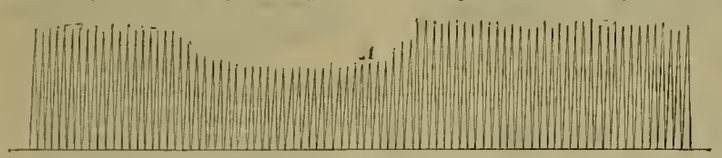

Fig. 4. "A." Speed Diagram from a Common Governor. Load Thrown on and off.

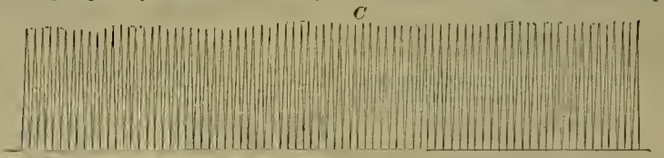

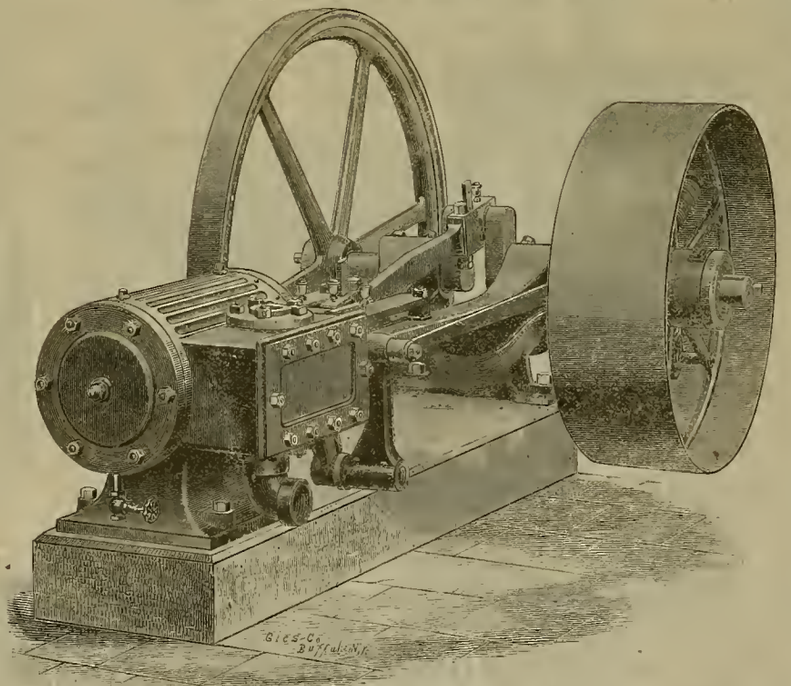

Fig. 5. "C." Speed Diagram from a Ball Governor. Load Thrown on and off.

HORIZONTAL ENGINE WITH BALL'S GOVERNOR.

One of these engines, 9x12, can be seen running at the establishment of Tatum & Bowen, 25 to 31 Main street, who are the agents for this coast.

It is making 220 revolutions, and runs without any perceptible variation in speed, though the load is very irregular. It indicates forty horse power.

The manufacturers are making a specialty of this engine and also of a high speed engine with the same governing device.

A 9x12 high speed engine, making 300 revolutions, has just been shipped to run a flour mill of 125 barrels per day. It will make 300 revolutions. Tatum & Bowen will apply the governor to the larger engines of their own manufacture.

THE President has given up the trip to Yellowstone Park. He says it will have to wait until he is a private citizen.

Metallurgy and Ores.

Nevada Metallurgical Works,

No. 23 STEVENSON STREET.

Near First and Market Streets, S. F.

ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores Worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, Etc.

Working Tests (Practical) Made.

Plans and Specifications furnished for the most suitable process for working Ores.

Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO,
(Formerly Huhn & Luckhardt.)
Mining Engineers and Metallurgists

JOHN TAYLOR & CO,.

IMPORTERS OF AND DEALERS IN

Assayers' Materials,

MINE and MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.

☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

FLOURNOY'S ANTI-SCALE COMPOUND

FOR STEAM BOILERS.

Will effectually rid of scale any steam boiler, and, as long as used, prevent its accumulation. Especially recommended to parties owning THRESHING MACHINES. Is entirely free from acids, acting as a preservator of the iron and a lubricant. Is recommended by the "Scientific American" as the best known. Has been used in the U. S. Mint of San Francisco for the past two years. Send all orders to

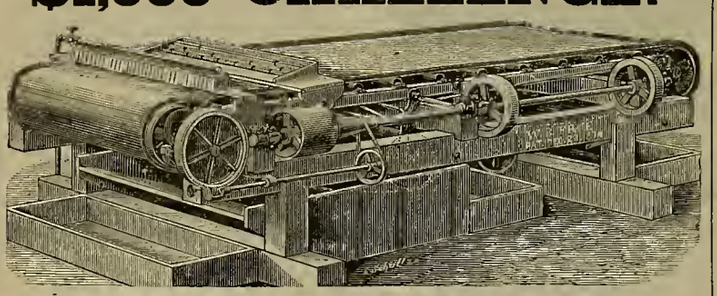
IMPROVED FORM

—OF—

HYDRAULIC GIANT



We call the attention of those using or interested in Hydraulic Mining Machinery to the above cut of an improved form of Hydraulic Giant, in which it will be observed that the Deflector and heavy weighting rear part are abolished and a lever attachment, working with a ratchet and pawl substituted, by which the pipeman, standing in the rear of the machine, has, without danger of "bucking," full control of the direction and effect of the stream. In an action in the U. S. Circuit Court, entitled F. H. Fisher and Joshua Hendy vs. Richard Hoskins et al. of the Marysville Foundry, a permanent injunction has recently been ordered against all persons manufacturing or using any form of Hydraulic Machine having the equivalents of the above.

All of the usual sizes are manufactured (under an exclusive right) and for sale at reduced prices by JOSHUA HENDY, at the

JOSHUA HENDY MACHINE WORKS,

49 and 51 Fremont Street, - - - San Francisco, Cal.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiere & Hayes, 220 Fremont Street.

To thoee intending to manufacture or purchaee the eo-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

ROTARY ENGINE.—Chas. C. Garcelon and Wm. A. Woods, Santa Cruz, Cal. No. 280,027. Dated June 26, 1883. This invention relates to certain improvements in rotary engines, and consists in various details of construction by which steam is admitted through one or two ports, so as to be used expansively, and by means of a hollow piston valve one or both ports may be opened or closed, or the engine may be reversed. In the operation of the engine, the steam is admitted through two ports and pressed upon two of the pistons with which the engine is provided. After thus starting, if the steam is to be used expansively, it is done by closing one of the entrance ports. When this is done, a small portion only of the piston having been projected, the steam follows it as it is gradually forced out, until the next piston reaches the port and intercepts any further supply to the first piston. The remainder of its stroke, to the point where it passes the first exhaust opening, is completed under the pressure of the expanded steam.

FOLDING BOX.—Paride Canessa, San Francisco, Cal. No. 280,013. Dated June 26, 1883. This invention relates to that class of boxes, trunks, valises, etc., which by their construction are adapted to be folded up into a small compass when not in use, thereby facilitating transportation. This box is connected with folding hinged sides, and ends, connected with the sides by peculiar links or hinges, adapting them to fold over the sides when these latter are laid flat. The ends enclose the removable top, and all the parts are secured together by pins. When the box is opened locking devices hold it firm and well capable of carrying its load.

PICTURE BRACKET.—Chas. Megow, San Francisco, Cal. No. 280,057. Dated June 26, 1883. This invention consists in an easily arranged device, to be suspended from the picture molding by other fastenings, and adapted to receive and sustain the picture. This rests on small brackets, and is hooked at its top from behind, by means of which it is supported and its inclination assured. The advantage of this device is in its simplicity, economy and effectiveness. It does away with nails and other means usually employed to suspend and hold a picture at its proper inclination.

Two Salt Lake hoodlums, one a son of Apostle Rich and the other of Probate Judge Smith, shining lights in the Mormon church, entered the Zions' Savings Bank a day or two since, felled the cashier with an iron bar and then made off with all the money they could get.

INDIGESTION, dyspepsia, heart-burn, nausea, etc., cured by using Brown's Iron Bitters.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct, or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time, we cannot be responsible for the errors or omission of agents.

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

News in Brief.

THE number of deaths in the city of New York vary from 150 to 200 daily.

THE Wisconsin prohibitionists talk of running a candidate for the Presidency.

CHIEF MOSES has completed and signed his agreement to relinquish his reservation in Oregon.

Fires in the Oregon woods have destroyed a great deal of valuable timber, lumber and other property.

IT is understood that President Henry Villard's excursion party to the Pacific coast will number 250 persons.

A WATERFALL 1,500 feet high, is reported to have been discovered at the head of the Cowlitz river, Washington Territory.

FRANK ROGEL, of Oakland, lost four children last week by diphtheria, and his only remaining child lies at the point of death.

DENIS KEARNEY, who lately attended the Anti-Monopoly Convention, was refused admission as a delegate to that body.

THERE were twenty-six cases of sunstroke in New York and six in Philadelphia one day last week. Many of them proved fatal.

PHYSICIANS, it is stated, have discovered over a hundred cases of leprosy among the boys of this city, caused by smoking Chinese made cigarettes.

POSTMASTER General Gresham has affirmed the validity of Key's order, denying the use of the United States mails to the Louisiana Lottery company.

MARCO A. SOTO, President of the Republic of Honduras, is on his way to Washington, with a view of establishing a reciprocity treaty with the United States.

GRIMLEY, the aeronaut who started from Honesdale, Pa., on July 4th, landed on the Catskills, encountered a severe hurricane, and had a terrible time generally.

ABRAHAM GOLDSMITH, a veteran pawnbroker of Chicago, was lately closed out under an execution. It is noted as something unusual in this line of business.

THEODORE THOMAS, who, with his noisy band, collected many ducats from our citizens a few weeks since, speaks now in terms not very complimentary of our people.

ACCORDING to advices from Behera, in Egypt, the cattle plague has ended with the death of all cattle in that district. The cotton worm is now doing great damage there.

ADVICES from Venezuela state that locusts are making havoc in many parts of the country. In one night all the vegetation in the neighborhood of Mooron was destroyed.

IT is reported that a yacht is being prepared and will be held in readiness to take the Khedive to Naples in the event of the spread of cholera making his departure necessary.

St. Mary's Hall, Benicia.

Among our notices of schools on another page will be found the announcement of St. Mary's Hall, Benicia, an institution for the education of young ladies, of which Rev. L. Delos Mansfield is director. Mr. Mansfield is on old and successful teacher, having been engaged in the work in the East long before coming to this coast, and in a school on the Hudson had the honor of educating the children of Wm. Cullen Bryant. His school at Benicia is in a highly prosperous and flourishing condition, enjoys a high reputation, and we doubt not is a most desirable place for the education of young ladies, to which sex its admission is limited. The catalogue contains a list of most desirable references, including some of the most prominent citizens of San Francisco, and gives full information as to the courses of study, terms, etc. Address Rev. L. Delos Mansfield, Benicia, Cal.

THE best cure for diseases of the nerves, brain and muscles, is Brown's Iron Bitters.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.

B. W. CROWELL—Arizona Territory
M. H. JOSEPH—Eureka, Nev.
I. M. LEIBY—Los Angeles, San Bernardino and San Diego counties.
A. C. KNOX—Oregon and Washington Ter.
J. J. BARTELL—Yolo county.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

The Secret

of the universal success of Brown's Iron Bitters is simply this: It is the best Iron preparation ever made; is compounded on thoroughly scientific, chemical and medicinal principles, and does just what is claimed for it—no more and no less.

By thorough and rapid assimilation with the blood, it reaches every part of the system, healing, purifying and strengthening. Commencing at the foundation it builds up and restores lost health—in no other way can lasting benefit be obtained.

75 Dearborn Ave., Chicago, Nov. 7.

I have been a great sufferer from a very weak stomach, heartburn, and dyspepsia in its worst form. Nearly everything I ate gave me distress, and I could eat but little. I have tried everything recommended, have taken the prescriptions of a dozen physicians, but got no relief until I took Brown's Iron Bitters. I feel none of the old troubles, and am a new man. I am getting much stronger, and feel first-rate. I am a railroad engineer, and now make my trips regularly. I can not say too much in praise of your wonderful medicine. D. C. MACK.

BROWN'S IRON BITTERS does not contain whiskey or alcohol, and will not blacken the teeth, or cause headache and constipation. It will cure dyspepsia, indigestion, heartburn, sleeplessness, dizziness, nervous debility, weakness, &c.

Use only Brown's Iron Bitters made by Brown Chemical Co., Baltimore. Crossed red lines and trade-mark on wrapper.

BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables, and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in subdivisions to suit purchasers, at very low rates and on easy terms. There are 12,000 acres at from $3 to $30 per acre, including pasturage, vine, fruit and grain land. Will sell a large tract at a great bargain. Send stamp for map and circular to EDWARD FRISBIE, proprietor (on the Grant), Anderson, Shasta county, Cal.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending June 30, 1883, the Board of Directors of the GERMAN SAVINGS AND LOAN SOCIETY has declared a dividend on Term Deposits at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum, and on Ordinary Deposits at the rate of three and six-tenths (3 6-10) per cent per annum, free from Federal Taxes, and payable on and after the 2d day of July, 1883. By order,

GEO. LETTE, Secretary.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 5 and South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 Le Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St. S. F.

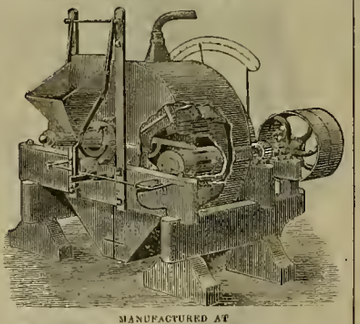
THE CALIFORNIA POWDER WORKS.
MANUFACTURERS OF
Sporting, Cannon, Mining, Blasting and
HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.



No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.
PATENTED IN THE UNITED STATES PATENT OFFICE.
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

THE ROLLER ORE FEEDER.
Patented May 28, 1882.

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or cost over a dollar for repairs.

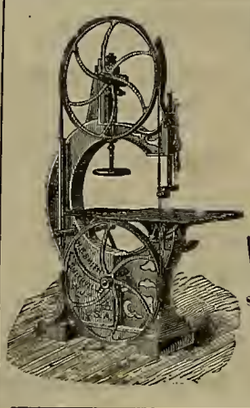
Cheap Ore Pulverizer.



There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

COKE. PATENT. COKE.

EXCELSIOR BLASTING POWDER,

Manufactured by the

EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro Glycerine Powder, as safe to use and handle as any other Nitro-Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

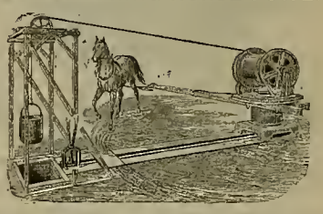
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.



WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

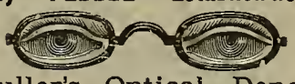
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.

It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.



While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. ☞ SEND FOR CIRCULAR. Address

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

The Dyer Cannon Ball Quartz Mill.

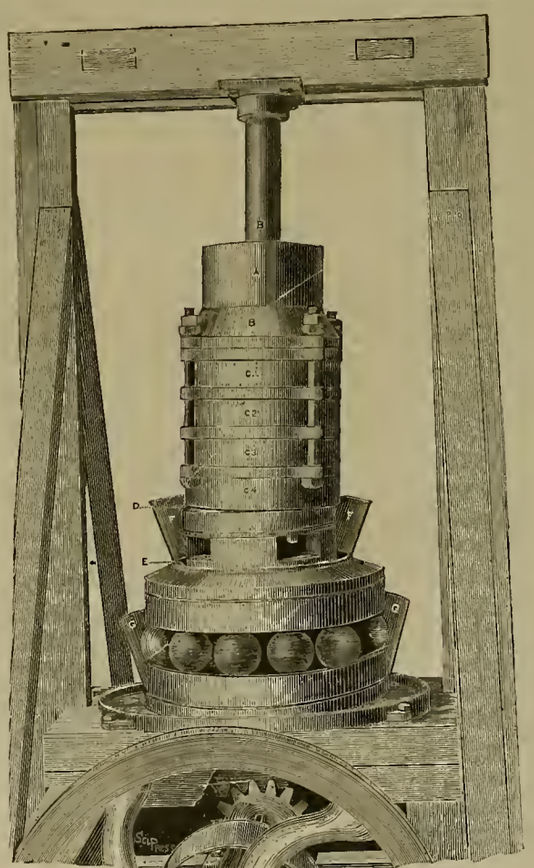
We present on this page cut illustrating a new style of quartz crusher, called the Dyer Cannon Ball mill.

Referring to the cut, A is a hopper through which the quartz enters the cylinder or rock-breaker. B B, the top section and upper shaft of cylinder, is in one casting, and has no connection with the cone or machinery working the mill.

C 1, C 2, C 3 and C 4 are the sections of hard iron bolted together, as shown, which comprise the cylinder. The lower section, C 4, is curved inside, to correspond according to a certain rule with the cone, and constitutes the principal wearing part of the cylinder, and as it does so, the section above it takes its place, and so on continuously. D, escape of crushed quartz from the rock-breaker. E, where it descends to the balls, beneath which, when further pulverized, it passes through the screen, C.

What is termed the cone, not shown in the cut, is provided with a "shoe" to renew the wearing parts, and is the only section directly acted on by the power driving the mill.

The cylinder and cone, which together constitute the rock breaker, rests upon a series of hard iron balls in circular grooved tracks above and below, moving or rotating freely upon them, and turning together in the same direction. Upon the introduction of the quartz, the cylinder and cone close continuously upon it, exert a terrible force, and the rock breaks up from point to point until it finally falls out through the discharge space of such degree of fineness as desired. From this point the crushed quartz passes beneath the balls, and is further crushed by the weight of nearly the whole mill upon them, and the crushing force of the rock breaker combined; the pulverizing is there finished and passes through the screen.



It will be seen that every part of this machine does some work; there are no idle pieces, even the weight as a whole contributing largely to the operation.

For this quartz crusher the inventor claims the following advantages as compared with stamps:

Less cost, wear and weight, and less power to run it, the reduction being from forty to eighty per cent. Being light and made in sections this machinery can be packed into localities where ordinary quartz mills could not be taken. The cannon ball crusher is simple, compact and strong, not liable to get out of order, and almost any one being able to run it. Parts that wear out most readily are easily replaced.

The movement is rotary, crushing (not grinding) either wet or dry equally well, and running in either direction the same. Runs light, makes but little noise, and does not injure by running empty. Will crush according to power used, readily geared for steam, water or horse power, and can be run by hurdy gurdy wheel on pinion shaft. Occupies but little space. Is quickly set up and removed. Will take in good size quartz, dispensing with rock breaker where this is an object or necessary; leaves the gold bright and easy to amalgamate, and can be cleaned up in a few minutes; the discharge ample, and but little wear on the screen, no coarse quartz coming in contact with it. The frame can be constructed where used, thereby saving freight.

Several of these mills have been put up and are now running at different points in the mines, and are said to give entire satisfaction. A number more are now being built at the Globe foundry in this city, to fill orders from the interior. The prices of these mills vary with size. No. 1, capacity 6 tons, weight 2,500 pounds, costs $350; No. 2, capacity 12 tons, weight 4,500 pounds, $600. Larger mills in proportion. Two smaller sizes than No. 1 are made, and of about 500 and 800 pounds weight, and of about 1½ to 3 tons capacity respectively. These are convenient for prospecting, etc. Parties interested in ore crushing can see these mills in operation at No. 520 Fifth street, where they are invited to call and witness the same. One of them has been running for several months near Iowa Hill, Placer county; also one at Grizzly Flat, El Dorado county; whence come favorable accounts of the work done by them. A number of the machines have been

DYER CANNON BALL QUARTZ MILL.

ordered by mine owners about Grass Valley, and elsewhere in Nevada and adjacent counties. As this mill seems to meet a long standing want of our quartz miners—something cheap, durable and portable—we should be glad to be kept fully advised as to results of further trials of its merits.

Bessemer Cast Steel.—It is said that the first cast of Bessemer steel in America, was made on the 7th of May, last, at the Pennsylvania Steel works, Harrisburg, Pa. The pig iron contained two and a half per cent of phosphorus, and was made from a mixture of South mountain ore and mill cinder. The resulting steel contained only 0.04 phosphorus and 0.12 carbon. The steel was made in the old plant of the works named, which has two seven-ton converters, the pig being re-melted in a cupola. Several heats were made last week with complete success.

Working Miners and Bullion Production.

According to the last report of the Director of the Mint, the number of men at work in the mines of California in 1882 amounted to 37,147, being much the largest number so employed in any of the States or Territories of the Union, Colorado, with 28,970, ranking next in this respect. While the bullion product of Colorado for that year reached $19,860,000, that of California amounted to only $17,645,000; the smaller number of men employed producing in this instance the larger amount of bullion. Generally, this would be construed to the prejudice of California; so, however, we do not view it. We have not in this State, as they have in Colorado, Nevada, Utah and Arizona, any mining companies making an inordinately large and profitable production of bullion. There is not in the State a single company whose gross annual product reaches half a million dollars. But we have a good many companies who are making very fair, and in some cases large net earnings on the amount of capital invested.

With us the profits of mining are widely distributed. A high percentage of those here engaged in the business are self-employers. They own the claims they work, and any resultant profit inures to themselves. This class of miners is probably twice as numerous here as in Colorado. This is due to the habits of our people, coupled with the diversified character of our auriferous deposits and the various methods of working them. The old Californian dislikes to work for wages. He would rather be his own boss though he earn not over a dollar per day, than to receive two on hire. Then, our gold mines are so extensive and varied in form that they give room for a large working population. In each department of the business we have many different kinds of deposits. In quartz mining we have regular veins, seams and bunch deposits. In placer mining we have hydraulic, drift, river-bed, gulch, beach and divers other forms of operating. In the prosecution of some of these branches but little outlay for plant or apparatus is required, so that the man of small means, if so inclined, can very often engage in them to advantage.

As a consequence of these conditions the California miner is apt to be the possessor of a home, generally comfortable and sometimes almost luxurious. He has usually a well-built house with a garden and fruit trees about his dwelling. Very often these men own and cultivate a considerable tract of land. Fruit, grain and cattle growing is made a part of their business, being looked after at such times as mining does not require their attention. Along the entire main gold belt of California, fruits of most kinds and of fine quality can be grown with the greatest facility. Fair crops of hay and grain can also be raised here without much trouble. Water is good, fuel and lumber cheap, and the climate unequaled for salubrity. Through the construction of railways and good wagon roads, nearly all the mining districts of this State are now easily accessible. Enjoying so much that is essential to their comfort and happiness, the California miner is incomparably better off than the fraternity elsewhere, even though his average earnings be not quite so great. So, too, the bullion product of our State, though it suffer by comparison with some of our neighbors, serves no doubt a more beneficent purpose than the much larger amounts taken out by them.

Product of Quicksilver During the Past Year.

We are indebted to Mr. J. B. Randol, agent of the New Almaden mine, for the following table, showing the output of quicksilver by the several mines worked in this state during the year ending June 30, 1883, and the total production made. Besides the properties named in this list, a few mines were worked in a small way, their entire yield being estimated by Mr. Randol at only 671 flasks. As this gentleman possesses superior facilities for obtaining correct data on the subject of quicksilver production in this State, and is careful in collecting the same, his figures and statements may be accepted as authoritative:

Mines.	No. Flasks.
Napa Con.	6,351
Great Western	3,514
Sulphur Bank	3,053
Reddington	2,655
Great Eastern	2,673
New Idria	1,720
New Almaden	28,753
Various	671
Total	51,290

An Old Electric Light Patent.—The first attempt to manufacture electric incandescent lamps, has been ascribed to M. de Chagny, whose operations were said to have been conducted some twenty years ago. The credit of the invention and its practical application, however, are now claimed for a young American, Mr. Starr, whose patent was taken out in 1845.

CORRESPONDENCE.

Ross Camp.

Hassayampa District, A. T.

[From our Arizona Correspondent.]

Ross Camp, a part of the Hassayampa mining district, lies about twelve miles south of Prescott. It is very elevated, being situated at the head of the Hassayampa creek, and nearly as high as the Flint mines on the Union peak ridge, at the head of Jersey gulch. The country about the camp being a little lower, shows less gold and more silver, lead and copper, especially as the veins get below water level.

In company with Col. Biglow, I first visited a singular kind of ore lying apart from the principal mines. The vein is very wide, thirty feet or more across, and some portions giving high assays of silver.

This location, called the Sumner, has been developed by an open cut, run forty feet through hard slate. It shows a very strong lead of silver bearing ore, in conjunction with slices or kidneys of mineral resembling iron carburet, being in fact a micaceous iron. It is free from grit, very bright, and so soft as to rub fine between the thumb and finger.

The prospects here were so good that the owners were encouraged to go below and tunnel in to strike the vein. They encountered hard slate country rock, showing glittering iron sulphurets, the cost of tunneling amounting to about $12 per foot. They found similar indications below as above. The whole is yet a mystery and a new experience, awaiting counsel and cash for further prosecution, if the owners so advise. (This property is now bonded in the East.) Two miles north of this locality, over the ridge, is

"The City of Mines,"

And I hereby copyright this name for this numerous family of separate leads, because if they were mapped off they would look like the streets of a town, with a main artery and many throughares.

The Davis, a silver-bearing lode, and the largest of the group, is traceable for miles. The mines on either side of this lode keep mostly parallel to each other, and come to join the Davis at an acute angle. A visit of a few minutes, passing hastily from one claim to another at different hights on the mountain, makes it risky to attempt any minute description of this city of mines, all existing in a genuine practical and visible sense. They belong largely to the burro whacking prospectors. The southerly and lower end of the Davis or Broadway is owned by Col. C. C. Bean and is well prospected by a tunnel 200 feet long. The supposed average assay value of the Davis ledge is given at $150; ledge five feet thick.

Other Lodes and Average Assays.

The Pearl, North Davis and Dunkirk, all strong well-defined veins, are opening up with good ore. They are owned by Dr. Smith and Col. Biglow, who are now piling up ore on the Dunkirk dump for shipment. Assays from the dark blue streak of the vein gave over $800 per ton; $477 gold, balance silver. This streak is four to six inches thick. A vein adjoining assays $282, $162 being gold, balance silver. The stratum here is about twelve inches thick. The iron streak on the west hanging wall, four to six inches, gave $35 gold, and some little silver.

Near the above lodes lies the Esmeralda, with piles of ore all bright, clean and free from cab-rock. This lode belongs to Dan Hatz and Don Nejia, who manage the work, and can tell to a cent the assay value of the different classes of ore on the dump. Many of these consist of azurites with chlorides, some of which have assayed over $1,000 per ton.

The Dosoris (wife's dower) is another, and favorite lode, carrying many kinds of rich ore, some nearly native silver itself. It is prophesied here that this mine will yet make some man rich.

Howell's Blue Dick forms one of the alley streets in this city of mines. It is idle, but filthy in lucre. It would be tedious to mention even a tenth of these well-named streets that promise in the early future to do each a wholesale business, on square coin basis. Among the names of mines here are those of nearly all the presidents, the birds of the air, and the States of the Union.

The old Senator mine, on the east side of the mountain, is also entitled to notice, seeing it has on many accounts besides its age, claims to honorable mention. Its ample development of 200 feet deep shows hidden treasures of gold to the amount of $160,000. The Senator, when on duty, speaks through the rappings of a ten-stamp mill.

Robert M. Hansen, a lad fourteen years old, has just discovered a fine galena silver vein, and bridged the faulty law by locating it in the name of his mother. The claim is traceable 700 feet in outcrops, and is found in excellent company. This clever lad was the first child born of a white mother in White Pine, Nevada, and must be a natural miner.

From the divide above these claims, Dr. Smith proposed "to play satan on me" by pointing out the vast wealth of the surrounding country and attempting to awaken in me, a foolish desire to possess myself of the same.

Below us was Slate creek, a branch of the Hassayampa, noted for the fact that this city of mines is located at its head branches. Beyond is the deep gorge of the big Hassayampa and off towards the south Walnut grove, one of the prettiest ranches in the Territory, owned by A. Wade, in the early sixties a successful quartz-mill man at Dayton, Nev. A little to the westward lies Antelope Mt., site of one of the early gold excitements, and in which thousands of dollars were taken out in a single day, and this without water for washing. It is now proposed to buy this Walnut grove ranch for a great reservoir site, and work the grounds below, which are very rich, by the hydraulic method.

Above and to right of Walnut is Peoples valley, named after one of the earliest settlers, still living there. Kirkland and Skull valleys follow. Just this side of Skull valley is Copper Basin, with Bradshaw peak named after Isaac Bradshaw, yet living and active, though carrying three-score years. He is widely known as "Uncle Ike," a title of respect. Bradshaw has taken a great interest in locating and developing the group of Copper Basin mines. Though strongly wedded to camp life, he retains his social and urbane manners, making him many warm friends. His brother, a noted pioneer and prospector, for whom the Bradshaw range of mountains was named, has been dead for many years.

The lofty knob behind and towering over us is Bean's Peak, so-called in honor of Col. Bean, who did good service in the late war for the preservation of the Union, and is now a resident and large mine owner in this district.

Things of the Past.

In my recent visit to the Hassayampa district, I crossed the bed of a deep rocky creek, the well-worn rocks of which showed that it carried sometimes a great volume of water, though so little is running there now that a man can step across it. On the bank of this creek I noticed an old house, the remnants of a water-wheel, and an old arastra, the place being now deserted. But these remains denoted that here had been made an effort some time ago to work the quartz, of which there is plenty and good looking in the neighborhood. This work was done before the present well-graded wagon-road, leading into the district, was built, and at a time when everything had to be packed in on animals. That the enterprise was abandoned does not prove the ores to have been lacking, or of poor quality, but only that there were too many obstacles to be contended with at that day to warrant the miner continuing his efforts. I know not the history of this plant, but just such small beginnings that often seem failures, and do bankrupt first parties, are the startings that in these frontier countries finally result in wagon-roads, quartz mills, saw-mills and towns. Then follow the continental railroads and their various branches, and the mountains and valleys are made to yield up their wealth and help to furnish the means for luxury and refinement, here and elsewhere. The prospector shows the place for profitable investments, though too often he reaps little of the benefits of the great treasures he discovers. The rich and poor can and should mutually benefit each other.

Passing onward and upward two miles the wagon road mentioned leads to the mining claims of Wm. C. Flint, formerly of San Francisco, now pleasantly located in this section over 7,000 feet above sea level in the midst of heavy pine forests, cool waters, and grand distant views. While in the Hassayampa country, I visited

The Delaware Mine.

Located on the top of a high ridge, and lying northeast and southwest. It is a large, well-defined ledge six feet wide, with ore vein of about two feet; rock, rusty decomposed quartz, carrying gold, silver, lead and copper, and will work $25 to $30 per ton. The vein has a regular course, and dips about 80 degrees, being nearly perpendicular. On this vein cuts and shafts have been made at various points to prove the continuity of the ore; one shaft is fifty feet deep. From this point to the southeast, across a ravine, in plain view, are

The Crook and Providentia Mines.

Supposed to run into this point. The Crook mine, which has produced considerable bullion, has a small prospect mill a few miles distant on the east branch of the Hassayampa now idle. The property belongs to Mr. Buffum, merchant in Prescott, and is reputed to be valuable. It is not free milling ore. The Delaware, at the extreme southwest end of location, has an open cut showing estimated $50 ore; 100 feet from this cut is a fifteen-foot shaft, the ledge growing to the thickness of five and a half feet at bottom of shaft. Mr. Flint has spent his labor on various points, and enough of it to show good looking mineral extending all through this 1,500 foot location.

The locality is easily accessible from the main road by a good wagon road leading one-half a mile through a beautiful pine forest, in which is excellent pasture and good water. But my pilot moves on to show me his other mine,

The Grosvenor.

Gold and silver, located near by, and also well shaded with cooling pines. "This is my south monument; here you see the course of the vein," etc., as an enthusiastic miner will talk when he thinks his text is solid. "This shaft is 500 feet from that south monument, is thirty feet deep all in ledge matter; from the croppings not less than twelve feet thick from wall to wall." This rock, a rusty, porous quartz, prospects well by the pan, but none of it has been milled.

Passing north by some small shafts and cuts, we arrive at the main shaft of the Grosvenor, 50 feet deep with a 50-foot level run south from the bottom. Descending this shaft, the vein is found to be about three feet thick, giving evidence of a good mine. The site of this lode being 7,666 feet above sea level we get here a fine view of the country for a great distance around. These are supposed to be the highest mines worked in the Territory. Looking off we see to the west of Prescott the Senator gold mine, owned by C. P. Head and Hugo Richards, and in nearly the same direction is the Dosoris silver mine, owned by a New York company; also the Blue Dick silver mine, owned by the Howell Smelting and Milling Company, at Lynx creek. A little further south is the Davis silver and gold mine of C. C. Bean, and Dan Hatz mine, with many more well developed claims at the head of Slate creek, a branch of the main Hassayampa. The Davis and Hatz ores of high grade have been reduced at Howell's works. Looking north is the head of Lynx creek—a heavy range of smooth mountain, covered with pine fit for lumber, mining timbers, fuel, etc. There are in that direction several good mines.

On the north slope of this range is located a mine and mill, owned by a Chicago company, who paid $110,000 for the mine, on which they have put up a Huntington oscillating crusher mill; also Wadleigh & Co.'s mine and mill of five stamps, and on the same lead as the Grosvenor, and only two miles distant. A little to the eastward of north is the Maj. Dakes group of mines, and a little below, his smelting works and saw-mill. Close to him is the Belle mine and Howell's reduction works, and the new town Howell.

Those valleys seen off through the low divide are good stock and farming valleys, and away beyond—seventy-five miles—are the San Francisco mountains. To the southeast is Turkey creek. Now who would not like to do up Arizona from one of these lofty shaded mounts? I do not blame our zealous California botanizers—J. G. Lemmon and wife—for making Arizona mountains a part of their home-station each year. I found in a garden at Copper mountain the wild potato discovered by him, now under cultivation by Mr. G. W. Hill, who hopes to develop it to useful size. Mr. H. remarked, as he showed it to me: "It's the prettiest thing you ever saw, as smooth as an egg; can't see any eyes till they sprout out."

Looking east, Mr. Flint, my guide, pointed out a high summit called Mt. Union. Elevation, 9,000 feet; the highest point in this region. The tourist can gain a grand panoramic view from this summit, and have no rocks to climb and no underbrush to ruffle his temper; shady, and perfectly luxurious for open air sleeping.

Descending the mountain about 200 feet we arrive at

The Fremont Mine,

With three shafts, twenty feet, twenty-five feet and forty feet deep, and three tunnels, twelve, twenty-five and thirty-five feet in length, all in vein matter and ore plainly traceable for 1,500 feet. Below the Grosvenor and Fremont joint tunnel is a good site for reduction works, with wood for years.

On the Grosvenor lode two tunnels have been run, one forty and the other 200 feet long, all in ore and vein matter.

Average samples of ore from these mines assay $40 per ton. Fifty tons worked gave good results. It is gold bearing, free, and presents a good appearance to the eye.

What Pluck will Do.

Mr. Flint met with reverses a few years since in San Francisco, and gave up everything, and landed in Prescott with less than one dollar cash capital. He proceeded at once to the mines, where he now has control of the property I have described. He has done the most if not all of this work, and it is well done too. He has now, after all these years of toil, a valuable compact mining estate, thoroughly prospected and ready for a company with means to employ skilled operatives and put up proper reduction works. With these conditions fulfilled, success is certain. This is one of many claims of varied character scattered through this belt now easily reached, the Arizona & Pacific railroad running sixty miles north and the Southern Pacific 145 miles to the south. The reason these mines have not sooner been developed is that the cost of doing so prior to the advent of the railroads has been too great, there being long stretches of sandy deserts to cross, and the Indians in former days giving much trouble.

Then the question is simply as to the value of ore thus exposed. A party desiring such information sent Mr. Riggs as expert to sample for average as well as he could; so he picked from different points clear across the ore stratum from wall to wall, which was assayed by Mr. Blake, of Prescott, and acknowledged to go $24, with a slight suspicion that all doubts were construed against the ore. Some fifty tons were worked.

B. W. CROWELL.

Prescott, Arizona.

More about Nickel.

EDITORS PRESS:—In your issue of July 7th, I noticed an article on the metallurgy of nickel, by Mr. Geo. J. Rockwell, of Sacramento, who claims to be the first on the coast to produce a bar of nickel bullion by simply smelting it from the ore. As this character of mineral has but lately come into prominence, but little thought or experimenting upon the method of working has been done, consequently, metallurgists have given the subject but little study; however, I desire to correct the above by a few facts which came under my observation.

In the fall of 1881 I sent to Mr. Charles Bell, of Sacramento city, ten samples of copper carbonate, for assay. Among them were two samples, one of deep apple green, the other a dark gray, intermixed with manganese. These samples proved upon analysis to be a fine grade of nickel. Upon this showing, Wm. S. Bell, of Oakland, an experienced miner, came to my place, and we examined the country for miles, being rewarded by the discovery of the Table mountain and Cottonwood canyon mines, samples of which were forwarded to Charles Bell, of Sacramento, who thoroughly analyzed them; also Edwin Booth, of San Francisco. Since that time Mr. Bell has been experimenting upon the feasibility of extracting the metal upon the ground; this he has accomplished, by smelting several bars of nickel from the ore as taken from the ledge, and a furnace of peculiar design is now being erected by Smith & Bell, in Sacramento city, in order to thoroughly demonstrate the practicability of erecting a smelter upon the mines, when we hope to again bring the State of Nevada into notice and renew the flush times of the Comstock, as their is no doubt but these nickel mines will open out far beyond all expectations, as large bodies have been exposed which grade from seven to thirty per cent. Work is being pushed forward as fast as possible, and the company are determined to leave nothing undone to thoroughly develop their property.

Lovelocks, Nev., July 11, 1883. L.

Assay Ton System of Weights.

Walter Lee Brown, author of Brown's Manual of Assaying, writes on the above subject to the Chicago *Mining Journal* as follows:

The so-called assay ton system of weights seems to be one of the bug-bears surrounding the art of assaying to many beginners, especially those advanced in years and opposed to progress, and whose knowledge of weights is based entirely upon the arbitrary systems known as the Troy, Apothecaries' and Avoirdupois. There is no difficulty in understanding it, and I think my explanations will make the matter clear to all.

The assay ton system is not restricted to any one system of weights—it can be applied to all, be they in use in whatever country they may.

First, then, to illustrate its use: An assayer weighs, of an ore to be tested, we will say 1-5 A. T. (assay ton.) Very well, as a result he obtains a bead of silver weighing 10 milligrammes. If 1-5 A. T. produces 10 mgrs., (milligrammes), 1 A. T. of the ore will produce $10 \times 5 = 50$ mgrs. of silver, and the assayer reports the ore as carrying 50 ounces of silver to every ton. The simplicity of the arithmetic, rapidity of calculation, and difficulty of making mistakes are all apparent here; but let us see where he obtained his starting weight of 1-5 A. T., and what relation it bears to the well-known ton.

In this particular case the French or metric system of weights is the one employed as a basis; but that is immaterial, as will be shown further along. To proceed: 1 ton Avoirdupois = 2,000 pounds Avoirdupois; 1 pound Avoirdupois = 7,000 grains Troy; therefore, 1 ton Avoirdupois = $7,000 \times 2,000 = 14,000,000$ grains Troy; 1 ounce Troy = 480 grains Troy; hence, $14,000,000 \div 480 = 29,166$ ounces Troy in 1 ton Avoirdupois.

Now, the assay unit, called the assay ton, is (in this case) a weight of 29,166 grammes (a gramme being equal to 15.4 grains Troy), or, (1 gramme being equivalent to 1,000 milligrammes) 29,166 milligrammes. Hence the relation of milligrammes to ounces is as 1 to 1—in other words, a milligramme corresponds to an ounce; so that if by assay of 1 A. T. of the ore we obtain gold or silver to the amount of 4 milligrammes, then, without any calculation, we know the ore will run 4 ounces to the ton.

The above calculation starts out with the short or American ton of 2,000 pounds. The long or British ton weighs 2,240 pounds, but we can use it in like manner as a factor, thus: $7,000 \times 2,240 = 15,680,000$; $15,680,000 \div 480 = 32,666$.

Hence the unit of an assay ton system for Great Britain or Canada, based on the ton of 2,240 pounds, would weigh 32.666 grammes, and accordingly as we took fractions or multiples of it in assaying ores, so would our resultant beads of the precious metals be fractions or multiples of an ounce per the long ton.

Those who may object to the metric system can still use the assay ton system by making the unit a weight of 291.66 grains troy, or 326.66 grains troy. In actual work it has been found that 1-5 A. T. of the gramme system, equals 5.83 grammes, equals 90.01 grains troy, is a good quantity of ore to use in an assay. An equivalent amount, or nearly so, in the grain assay ton system first given, would be ½ A. T. equal to 97.22 grains.

The adoption of any system of assay ton weights avoids long calculations and the use of tables. By employing a whole number for the weight, then dividing the result by the said number and multiplying the quotient by 29,166 or 32,666, we obtain the same figures as by the assay ton system, but this necessitates considerable multiplication or the use of previously prepared tables.

MECHANICAL PROGRESS.

Destruction of Steam Boilers.

The Dusseldorf Soc. for supervision of steam boilers consider the following to be the chief causes for the destruction of steam boilers: Corrosion of steam boilers on the outside is principally due to the action of the heating gases and of the moist masonry. The products of combustion very frequently contain sulphurous acid, which, in contact with moisture, is gradually converted into sulphuric acid, and as such, corrodes the iron. The moisture of the brick work causes direct rusting. With regard to interior corrosion, the following points are to be noted: When an upper and lower boiler are used, the feed water is let into the latter, which the fire gases reach last, and, therefore, is not so hot as the other. It is often noticed that the separate plates of this boiler are pock marked with little grooves. When fresh water containing air is warmed, little bubbles of air containing much oxygen form, and as there is very little motion in this part of the boiler, they adhere to any rough spots on the iron and are destructive to it. It is easy to see that rough iron is attacked more readily than smooth, and, of course, the action is most powerful in the grooves themselves. If steam bubbles attach themselves to any spot whatever in a steam boiler, where the temperature is not very high from its being heated with hot gases only, rusting will take place. Here, too, the atmospheric air in the feed water would be the destructive agent. Hence, if care is taken to keep the water in motion circulating around in the boiler, the chief cause of internal corrosion will be for the greater part neutralized.—*Polyt. Noti.*

FINISHING FILES BY SAND BLAST. It may be of interest to state that the chief value of the well known sand blast method of sharpening files does not consist so much in its application to the sharpening of old files, but in finishing new files that have just been cut. Experiments have shown that such files, submitted to the action of a sand blast, exhibit greater resistance to wear and greater cutting power than files as ordinarily made. In order, however, to obtain definite figures as to their superiority, a series of experiments were made some time ago, yielding the following results: A new bastard file some fourteen inches long was finished on one side according to the sand blast method, while the other side remained in its ordinary state. Still another file of the same dimensions, and which had been in use for some time, was sharpened by a sand blast, and three pieces of gun metal of exactly the same size and the same composition were then operated upon, until finally one of the three cutting surfaces of the two files were found useless for further work. They were then used on cast iron, wrought iron and steel, and in each case it was found that the ordinary file gave out long before the others. The ordinary file was completely worn out during the trials, while those which had been subjected to the sand blast were still in condition for further use. It may also be remarked that Mr. Friedr. Krupp, of Essen, Germany, has introduced the method in his works.

ROLLING COLD IRON.—The process of rolling cold iron owes its discovery to merest accident. A foundryman, a workman at the rolls, neglected to take his tongs from a bar of heated iron in time, and they were carried through the rolls. Much to his surprise, the tongs, instead of being broken in passing through the rolls, were reduced to the same gauge as the heated bar, and shone like steel. The workman called the attention of the superintendent to what he thought was merely a "funny" circumstance; but the superintendent jumped at the conclusion that if it were possible to roll iron cold once it could be done again. He commenced to experiment, and had not gone far before he discovered that cold rolled iron was in every respect the equal of steel for shafting purposes, and in some respects it is superior, as it is more easily turned to any desired size than steel. Other discoveries followed this, and the process for rolling iron cold was patented.

HOW TO ANNEAL SMALL CASTINGS.—A correspondent of *Cotton, Wool and Iron* says: Have some cast iron boxes made, say six inches wide by six inches deep, by twelve inches long and one half inch thick, without covers. In these boxes first put a layer of cast iron turnings, about one half inch thick; then a layer of castings, packing them as close as possible, and fill all the space between the castings with turnings. Fill the box in the above manner with castings to within one inch of the top, which fill even full with the turnings. Heat the whole to a cherry red, and let them cool off slowly. I have repeatedly annealed castings that were not over three thirty-seconds of an inch in thickness, and "as hard as glass," in the above manner with perfect success.

GROWING COMPETITION OF THE GAS ENGINE. —It is stated that English shops engaged in the manufacture of the lighter class of steam engines are receiving very few orders for such work. It is also stated that this new falling off in such orders is mainly due to the increasing demand for improved gas engines of small capacity, the manufacture of which is rapidly increasing. The gas engine in England, at any rate, is gradually, but surely, taking the place of the steam engine, where only a small driving power is required.

CUTTING STEEL WITH SOFT IRON. It is well known that the hardest steel can be readily cut with soft iron. A grindstone may also be most readily made true with a bar of soft iron. The *Northwestern Miller* explains the philosophy of the thing as follows: "The discovery is as old as Tubal Cain, the first known cunning worker in brass and metal. It is on the same principle that the barber cuts the superfluous steel from the edge of his razor, by the same principle of abrasion, without ascribing any magnetical attraction to his strap. A small, sharp stream of water never fails to cut the hardest rock it meets with; in short, all rivers form their beds by the same power of abrasion, or friction. Suppose a plate was six, eight or ten inches in diameter, and only one-twentieth of an inch thick, it would occupy a very small line on the material to be cut; every particle of that line would be subjected to many yards of particles, by the rotary motion of the cutting wheel, and no two particles of the line could be touched at the same time by any round wheel; if the wheel were hard it would not cut so well, but glide over; but the file, or saw, being hard, makes no difference here, because each particle, on being subjected to the current of friction, soon becomes softened, and serves to compose the flash of sparks seen on such occasions."

IS IT POSSIBLE TO CAST A CHAIN?—A correspondent of *Cotton, Wool and Iron* asks this question, "Is it possible to cast a chain, and if so, how should the pattern be made and molded? Although we are living in an age when iron is being drop forged and welded in all variety of shapes, still all this is threatened to be set aside by the facility with which steel is being cast into every variety of forms, and if a chain can be cast from one kind of metal without much trouble, why not of cast steel, which is both strong and enduring, and set aside the trouble of forging and the difficulties in welding the short links for a chain?" In this connection we may remark that a die for welding links has recently been patented by Mr. Frank A. Iddings, of Warren, O. The die relates specially to the welding of links used in railroad car couplings. By a peculiar construction of welding dies, increased facility is afforded for opening the dies when necessary to remove the welded link. A finishing die is likewise provided, which operates in connection with the welding die.

CASE HARDENING.—Probably no better method of case hardening can be employed than that of packing the article to be hardened in a box or crucible with the carbonizing materials—ground bone or animal charcoal—luting the vessel tight, and exposing it for several hours to a red heat. In large establishments, where case hardening is a daily duty, ovens and special appliances are always at hand. But when there is only one piece to be treated, and the necessity for case hardening occurs only occasionally, a simpler method may serve. It is well to keep on hand for this purpose a powdered mixture of prussiate of potash and bone black or animal charcoal, in equal proportions by quantity. This may be applied to the red hot iron, either as a powder, or as a paste made with oil or even mixed with water.

PROGRESS OF AMERICAN CARRIAGE INDUSTRY.—A thoroughly made American pleasure carriage could not be had in this country in 1860. We were obliged to import the springs and other steel work and most of the textile trimmings; but as we now make as good steel as we import, and produce our own silks, fringes and tassels, we build our own carriages. Under protective duties we build, in the single State of Ohio, more pleasure carriages annually than are produced in Great Britain and France combined, and the returns of the census show the existence, in 1880, of more than 43,000 establishments for the manufacture of carriages and smithing, which employed, in that year, 105,000 hands, to whom were paid as wages, more than $38,000,000.

EFFECTS OF COMPRESSION ON THE HARDNESS OF STEEL.—Mr. Lan reports that at the works of Saint Jacques, at Montlucon, France, the method of compressing cast steel has been applied on a large scale. The process consists of submitting the molten metal to the action of an hydraulic press which can exert a pressure of from about 15,000 to 22,000 pounds per square inch, the pressure being kept up until the ingot has solidified and cooled. The result of this method is a great increase in the strength of the metal.

SUPPOSE we wish to know the largest square that can be cut from a circular sheet of given size. To ascertain without measuring, multiply the diameter by 0.7071, and we have the side of a square that will be contained in the circle. This is a useful rule for all trades. Machinists very often have occasion to use it; so do boiler makers and lumbermen.—*Mechanical Engineer.*

LUBRICANT FOR HEAVY BEARINGS.—The following lubricant for heavy bearings will be found excellent: Dissolve the best white lead in good machine oil, make it pretty thick, take all the hard and clotty substance away, then add the remainder, and you will find this a good lubricant.

AMERICAN PLUMBING.—British architects appear to concede that plumbing and other sanitary arrangements of American houses are far better than those of the English.

SCIENTIFIC PROGRESS.

Photographing the Solar Corona.

Huggins has succeeded, by the aid of colored glasses and potassic manganate, in photographing the corona. Using a Newton three-inch telescope, with a focal distance of three and a half feet, he obtains a very distinct photographic image of the sun, without any perceptible defect. When the exposure is very rapid, there can be seen around the sun, under suitable conditions of illumination, the interior corona, which is more regular in form than the exterior corona, and which extends about a quarter of a solar diameter beyond the sun's image. An exposure a little less rapid produces a reversal of the photographic image of the sun; the interior corona is absorbed in the exterior, which appears black, as in a negative proof. If the exposure is a little longer, the reversal is produced both in the solar image and in the corona, but not in those parts of the plate which are affected by the atmospheric light alone. Afterwards the plate represents the corona in white, as in a positive proof, and the atmospheric light in black. Then the straight and curved lines, and the other varied forms which characterize the corona, can be easily traced. Captain Abney has carefully compared these plates with those which were taken during the last total eclipse. He does not doubt that Huggins is able to photograph the corona at any time without waiting for eclipses, which occur only fifteen times in a century. The new method will enable observers, especially in southern climates and at high elevations, to make this phenomenon, which is one of so great importance in solar research, the subject of daily study.—*Comptes Rendus.*

A REMARKABLE SAURIAN.—The Brazilian Minister at La Paz, Bolivia, has transmitted to his government at Rio Janeiro, photographs and drawings of a most extraordinary saurian, lately killed near La Paz, but only after receiving thirty-six rifle balls. The dried body of the monster has also been preserved. The body is twelve meters long from snout to point of the tail, which latter is flattened. Besides the anterior head, it has four meters behind, two small but completely formed heads (?) rising from the back. All three have much resemblance to the head of a dog. The legs are short and end in formidable claws. The legs, belly and lower part of the throat appear defended by a kind of scale armor, and all the back is protected by a still thicker and double cuirass, starting from behind the ears of the anterior head and continuing to the tail. The neck is long, and the belly large and almost dragging on the ground. Professor Gilveti, who examined the beast, thinks it is not a monster, but a member of a rare or almost lost species, as the Indians in some parts of Bolivia use small earthen vases of identical shape, and probably copied from nature. Mr. William E. A. Axon, in a note giving the above to the *Journal of Science*, says: "If this account should prove to be accurate, it would form a counterpart to the etching of the mammoth, which forms so interesting a memorial of prehistoric art."

FRENCH ACADEMY PRIZES.—The French Academy of Sciences has recently published a list of the prizes offered by them for essays on scientific subjects during this year and until 1886. In applied mechanics the Fourneyron prize will be given for the best "study, both theoretical and experimental, of the different methods of transporting force to a distance." A grand prize will be awarded in 1884 for a mathematical solution of the problem "to perfect in some important point the theory of the application of electricity to the transmission of power." The prize will consist of a medal valued at 3,000 francs. The memoirs must be submitted to the secretary of the Academy before June 1, 1884, and should be anonymous, but accompanied by a sealed envelope with the real name and address of the author. The Bordin prize, which was not awarded this year, is carried on to 1885, and memoirs must be lodged before June 1st of that year. The subject is a "research into the origin of electricity in the atmosphere, and the causes of the great development of electric phenomena in storm-clouds." The prize is a medal worth 3,000 francs.

A NEW FOOD.—According to the *Chemiker Zeitung*, M. Muller has evaporated skimmed milk in a vacuum, so as to obtain a permanent product, which can be preserved for many months in a dry atmosphere, and which has valuable alimentary properties. He thinks that it may be of great use in pastry, and in various kinds of baking, and the best sugar of milk can be made from it. The skimmed milk which is collected in dairies and cheese factories, is usually given to animals or wasted in sewage; it contains, however, large quantities of salts, and particles of butter and caseine, which can be utilized by Muller's method.—*Rev. Scientif.*

THE QUESTION is being seriously asked whether the increasing transfer of iron from the earth's interior to its surface, can have any influence upon the weather. It seems that, at least, the vast masses of iron that are being spread out in railways, bridges, etc., must affect the electric currents which move about the earth. Perhaps the cyclones becoming more frequent and destructive every year, and which are now recognized as electric storms, may be traced to this cause.

TO DETERMINE THE QUANTITY OF MOISTURE IN WALLS.—Dr. W. Hesse, a district medical official at Schwarzenberg, has communicated to the technical press of Germany a simple process for the quantitative definition of the free water which may be contained in a wall. For the carrying out of this process it is necessary to have a number of small glass flasks with glass stoppers. These should be of about one-half to five-eighths cubic inch capacity, and of known weight. A small portion of mortar sufficient to fill one of the flasks is taken from the internal surface of the wall by boring with a tool specially constructed, and also by scraping from the wall, a piece of paper being held underneath. After the removal of any large impurities particles the flask is filled rapidly, and well closed with an india-rubber stopper. In the laboratory the flask itself, as well as the inner surface of the neck, is carefully dusted, the glass stopper is inserted and the flask weighed. It is then exposed in a drying oven to a temperature of 212 to 230 F. until the mortar is completely dry, this process usually taking several hours. The flask is then allowed to cool in an apparatus specially designed for the purpose, and is again weighed. By deducting the weight of a vessel (as previously ascertained), the difference between the weight of the mortar before and after drying is arrived at, and the percentage of moisture is thus established.

PHOTOGRAPHING THE VOCAL ORGANS.—Some attempts have been made in London to photograph the human vocal organs in the act of singing. The principal object was to obtain a picture of the ligaments known as the vocal cords, which are situated at the top of the larynx. These can be viewed in the laryngoscope, a small mirror, which when placed at the back of the throat serves at once to reflect light upon the membranes, and to form an image of them visible to the observer. With the aid of this instrument numerous observations have been made upon singers, and most valuable information has been collected, but all previous efforts to obtain a photograph by substituting a camera for the observer's eye have entirely failed. The difficulties were overcome by the use of a powerful Siemens electric lamp, supplied by a dynamo machine. By means of this light some excellent photographs were obtained of the laryngoscopic image. The patient in each case was Herr Belnke, at whose instance the experiments were made.

ELECTRICITY.—The following not over well authenticated paragraph is floating about in the sea of newspaperdom: The most astonishing claim yet made in behalf of electricity is, that it has been proven possible to convey by it vibrations of light, so that it is practicable not only to speak with a distant friend, but to see him. According to the Otago *Times*, Dr. Guidrah, of Victoria, has invented an apparatus, called by him the electroscope, which accomplishes this. The paper in question says that a public test of this instrument was made in Melbourne in the presence of some forty scientific and public men. Sitting in a dark room, they saw projected on a large disk of white burnished metal the race-course at Flemington, with its myriad hosts of active beings. Each minute detail stood out with perfect fidelity to the original, and as they looked at the original picture through binocular glasses, it was difficult to imagine that they were not actually on the course itself, and moving among those whose actions they could so completely scan.

POWER OF THE WAVES.—The tremendous power of the sea waves has been illustrated at Wick, on the extreme northeast coast of Scotland, where a breakwater was being built. It may give an idea of what wave power really can do. It was found that stones of ten tons weight were as pebbles to the waves, which have been measured to be fifty-two feet from the crest to the bottom of the trough. The outer end of the breakwater, where the storm beats most violently, was built of three courses of 100-ton stones, laid on the rubble foundation; next above these were three courses of large flat stones, and upon these a mass of concrete, built on the spot, of cement and rubble. The end of the breakwater was thought to be as immovable as the natural rock, yet the resident engineer saw it yield to the force of the waves, and swing around into the troubled waters inside the pier. It gave way, not in fragments, but in one mass, as if it were a monolith. The displaced mass is estimated to weigh about 1,850 tons.

RAINBOW GLASS.—The soap-bubble colors upon glass are produced by a vapor, which is deposited on the hot glass before it goes into the annealing oven. The vapor comes from a mixture of protochloride of tin, carbonate of baryta, and carbonate of strontium. It is said that the workmen of a Bohemian manufacturer, wishing to celebrate his arrival, kindled some Bengal lights in the annealing furnaces, and the pieces which were in the furnaces all became iridescent. The colors can be removed by hard rubbing. Messrs. Clemandot and Fremy produced a pearly luster, like that of shells, by means of different chemical agents, chlorhydric acid among others, under pressures of four, five, or six atmospheres. They were thus able to imitate the magnificent glasses of antiquity, which have become iridescent through the lapse of time.

A KNOWLEDGE of drawing and use of tools is of incalculable worth in all trades.

ENGLISH gold coin is said to have become so worn that it will cost $4,000,000 to restore the $25,000,000 in circulation.

Mining Share Market.

Operations in mining shares during the week are without interest, the market has been feeble and inactive with few transactions, and prices of the preceding week but little changed. As usual, accounts from the leading comstock mines continue hopeful. In the absence of new ore developments the long hoped for "boom" seems as far off as ever, and since "hope deferred maketh the heart sick" that organ with the expectant crowd must by this time be extensively diseased, nor is the outlook at all encouraging. Without any new finds, and the two principal "bonanza" magnates away in Europe, the prospects for a more lively market grows every day "smaller and beautifully less." Meantime, the ranks of the "chippers-in" are being thinned out. The habitues of "Paupers' Alley" grow daily more seedy and dropping off one-by-one disappear from view. The occupation of the chaquer is nearly gone, and the grinding with the curb-stone broker is low, where this decadence is to end without an early strike on the Comstock or a generally "whooping-up" of the chiefs, it is easy to devine—the whole miserable business must inevitably go to the dogs.

Bullion Shipments.

Mt. Diablo, July 12th, $7,633; Bodie, 16th, $3,122; Northern Belle, 12th, $5,513.66; Tiptop, 14th, $4,876; Central City, 16th, $41,000.

PRODUCTION OF GOLD.—The future supply of gold, even for coinage purposes, is beginning to be one of more than common interest. Ancient history is resplendent with the prodigal display of gold by the barbaric peoples of the Orient. Arabia, Egypt and Africa, according to this same authority, were prolific in their production of this precious metal. Pliny states that Cyrus returned from his conquest with 34,000 pounds of gold (about $10,000,000). Alexander the Great brought $100,000,000 in gold from Persia. But at the present time these great fields, so renowned in history, are barren, so far as the production of gold is concerned, and it is evident that Europe can no longer be depended upon to perform any appreciable part in furnishing a supply of gold to meet the demands of the future. Even in this country the statistics of production show a constant and marked decline in gold, although the field is largely extended and mining is more thoroughly prosecuted than ever before.

PAPER STEAMBOATS.—Some of our exchanges are under the impression that a paper steamboat has recently been launched at Pittsburgh. This is a wrong impression. Pittsburgh steamboat builders have not yet got beyond the use of wood, iron and steel in their department of industry. The paper steamboat is not of the present, nor of the past. Further than this, we are not willing to accept any responsibility.—*Am.*

GROWTH OF OAKLAND.—In 1860 the population of Oakland to San Francisco represented a ratio of 1 to 37; in 1870, 1 to 15; in 1878, 1 to 8, and by the school census of 1883, 1 to six.

The digestive organs weakened and worn out by using cathartic medicines, restored by using Brown's Iron Bitters.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MAHONEY.—*Ledger*, July 14: A favorable change is reported in this mine. Good rock was struck in the 900 level on Monday last. It has every appearance of being permanent, and it is probable that a portion of the mill will be started on it in a few days, when the quality of the ore will be definitely ascertained.

FROM DRYTOWN.—The Palmer, or Black Hill Co. cleaned up $3,000 the other day, that being the result of a run of 21 days.

JACKSON.—Operations have once more come to a standstill at this mine. The miners quit work Sunday morning, and nothing but pumping out water has been done since. The cause of this suspension is that the company was about six weeks behind in the payment of wages. The mine seems to be of a pocketty character, but the pockets encountered so far have not proved extensive nor rich. Some good ore has been met with, but not in quantity to justify the erection of a mill, or the hauling of the rock to a custom mill.

MISCELLANEOUS.—Messrs. Matson, Hagerman and Fleming have their quartz mill about ready to commence operations. The mill is built for 10 stamps, but only 5 have been put in at present. It is located at Red Hill, near Butte City, on the Mokelumne river side of the ridge. Water is conveyed by 300 ft of pipe with a pressure of 150 ft, which will enable the machinery to be run with about 15 inches of water. The mine is close by. The ore body is small—from 12 to 18 inches wide, but it is said to pay big. By pounding a small quantity of rock in a hand mortar they took out $100. About 100 tons of quartz lies on the dump ready for milling, and it is estimated that the yield from this will more than pay all expenses incurred in putting up the mill. They will get to work in a few days. J. Stewart has his 5-stamp mill near Butte City in running order, and started it the other day, but the water supply was hardly sufficient. The Kelly mill is again in operation on rock from Morgan's mine in Murphy's gulch.

Butte.

BIG BEND TUNNEL.—*Mercury*, July 13: The Big Bend tunnel is in about 2600 ft; the work is being pushed vigorously.

BIG BAR.—We were lately shown some specimens of gold, ranging from the size of a pin's head to that of a large pea, taken from the Big Bar drift mine, situated about eleven miles above Big Bend. The mine is the property of D. K. Perkins, of this city, and according to all reports it will turn out one of the richest in the county.

AT YANKEE HILL.—Fred Wellington, living near Yankee Hill, is the owner of a fine quartz lead, from which, he says, ten thousand tons of $15 milling ore can be taken out above the water level, at a cost not to exceed $2 per ton. The ledge is eight ft wide, and the owner thinks the supply of ore is inexhaustible. Mr. Wellington will show his mine to any parties who may wish to examine it. There are many other good leads in the vicinity. Wood and water are abundant, and good roads run to, or within a short distance of many of the mines. One of the great drawbacks to this section of the country is that there is no mill within reaching distance, by which the ore can be prospected. We have no doubt that a mill erected in the vicinity of Yankee Hill, to do custom work, would be a paying investment.

MINES ON BUTTE CREEK.—*Record*, July 14: J. A. Hedges & Co. have struck a blue stratum of gravel coming out of the hills which prospects surprisingly well in coarse gold. John Foley, working two men has taken out in six months nearly three hundred ounces of gold exclusive of expenses. Joe Rice just below the Foley claim, is putting money in the Bank of Butte County every week. William Longley has a very good claim on Boneyard Flat, making $1.50 to every bucket of dirt taken out. Alex. McIntyre, is working his hill claim, and making money, too. W. N. Nesbit, another of our forty-niners, has struck rich diggings opposite Whisky Flat, where he has located a derrick. He thinks Helltown will yet come up to the old palmy days of the past, when he used to take in a thousand dollars every Sunday.

Calaveras.

ABOUT WEST POINT.—*Chronicle*, July 14: The Star of the West mine has been yielding some very rich rock lately. The Haskin's mine is looking more favorable now than for years past. Mining experts and capitalists are here prospecting some of the old mines. Prospects look encouraging for this place. Five tons of ore from the Uno mine in Nassau Valley owned by Sylvester & Co. were recently worked by arrastre process, which yielded $15 75 per ton. The shaft from which the ore was taken is about 27 ft deep, and the vein about two ft wide.

El Dorado.

RICH SULPHURET.—*Republican*, July 12: Mr. Stevens, who is developing a promising gravel mine in the vicinity of Texas hill, has opened up a sulphuret vein of considerable dimensions that is exceedingly rich in gold, assaying away up into the thousands per ton. In some of the small conglomorate pieces as much gold as anything else can be plainly seen.

BLAIR MINE.—The machinery here was started up last week, and the pressure was so great and applied so suddenly, that the large iron spur wheel was made a complete wreck in a twinkling. This injury was repaired by replacing it with a new wheel, and on Monday the works were started up again, and in a few hours a cog was broken in another wheel. A bad beginning.

VARIOUS MINES.—*Mountain Democrat*, July 14: The ditch property at Indian Diggings is reported sold to Alvinza Hayward. Mr. James D. Hague, president of the Mount Pleasant mine, Grizzly Flat, was in town Tuesday and went over to inspect the Gopher-Bowlder mine near Kelsey. We are confident that in such hands this mine would develop into one of the best properties in the State. It is an immense ledge, and even if the ore were of lower grade than it is would pay. The mining business is lively about Garden Valley. John G. Jennings, Jr., of Cleveland, Ohio, one of the owners of the Melton mine at Grizzly Flat, was in town yesterday, for the purpose of making final payment on the purchase of the mine.

Inyo.

THE MINERAL EXPOSITION.—Mr. Woodhull has finished packing the Independence collection of Inyo county ores and minerals, and the whole will be shipped to San Francisco the coming week. The specimens are over 500 in number, and they fill 14 boxes, and weigh about one ton. The specimens are from every district in the county, and every known mine of any value, and comprise samples of gold, silver, copper, and lead. They have been selected with great care, both for their beauty and richness, and we shall be much mistaken if they do not attract much attention when placed on exhibition.

A SALT SPECIMEN.—Sheriff Gregg has contributed a splendid specimen of salt from his salt marsh, near Big Pine, for the Mineral Exhibition. The piece is about three ft by two in size and eight inches thick. The salt has crystallized around and over a sage brush, leaving a portion of the brush partly exposed with the branches covered with salt crystals. It is a fine specimen and will weigh about 100 pounds.

Mono.

BODIE CON.—*Free Press* July 14: During the week ending the 6th instant 61.105 tons of ore were sent to the mill and 159.585 tons were crushed. The average assay value of the pulp was $31.92 per ton; that of the tailings was $4.90 per ton. The shipment of bullion was valued at $3,924.20. There were 101 car loads of ore hoisted from the mine, 72 cars of which were from the workings between the 640 to the 780-foot levels; the remaining 29 cars were taken from the 740 to the 770-foot levels of the shaft. At the 1000-ft level the west crosscut was driven 6 ft; its total length being 289 ft. The north drift, same level, is 294 ft long, a gain of 14 ft since last report. Work on the east crosscut at the 1000-ft level, which was suspended on the 7th of April last, was resumed, and has been driven 9 ft during the week, its entire length being now 370 ft.

VIRGINIA CREEK HYDRAULIC CO.—Bar No. 1 of this Co. was melted Thursday by A. Soderling, the assayer, giving a value of $2000. This company is operating at the old Mono diggings, and but a few days since commenced hydraulicing with a little giant. They have an ample supply of water, and a rich territory to work. They have been quietly getting ready for operations for some time, and there is every prospect that they will add materially to the resources of the county.

Nevada.

MINES IN BRIEF.—*Transcript*, July 14: The ledge in the Sherman Con. mine continues to improve in size and general appearance as the drift is extended south. The 600 level of the Nevada City mine shows a 10-ft ledge, which is the largest deposit of ore ever found in that mine. All of the quartz between the walls, pays well for working. As soon as this level is fairly opened up, sinking will be recommenced.

MINING FOR AGATES.—Capt. Weare, who has for three months past been prospecting for agates in the vicinity of Newtown, recently struck a ledge that yields some very beautiful specimens of various kinds, including chalcedony, carnelian, pure crystal, common moss agates, etc. He finds the deposits in pockets. His claim is at the head of Rush creek, three and a half miles west of this city.

MINERS DISCHARGED.—Since the breaking of the English dam 70 miners have been discharged from the Milton Company's mines at French Corral and only four remain in employ. As the dam can not be reconstructed in time to furnish any more water this season, the operations of the mine must be suspended, and the miners must seek elsewhere for employment. If repairs are not made to the dam this season there will be no water for next summer's work. As the company has made no sign as to what will be done, there is a feeling of great uncertainty among the residents below San Juan, and there are fears of a general business stagnation.

Placer.

IN FULL BLAST.—*Times*, July 14: The iron furnace at Hotaling are now using 80 bushels of coal to the ton of iron. They are now turning out 24½ tons of iron per day, and one day 30 tons were turned out. Last year 185 bushels of coal were used to make one ton of iron, and the result was only about half as much was produced as at present. There are now 165 men employed about the mine, and they get from $2.50 to $3 per day. The company issue scrip to their employes in any amount from 5 cents to $5 and issue it as often as it is wanted. This scrip is good anywhere in the town of Hotaling, as it will buy breadstuffs at the stores. None of the employes are compelled to trade at the company's stores. The mine is in better condition than it has ever been, and woodchoppers and teamsters are in demand there.

Plumas.

STARTED UP.—Greenville *Bulletin*, July 11: On Saturday last the new mill on the Premium mine was started up for the first time. The mill machinery was made at the Greenville Iron Works, and is as thorough in finish as it is complete in detail. The owners of this mine are all working men; during the past five years they have patiently an steadily worked to develop their property. They did not attempt to build a mill till they had first satisfied themselves that there was ore enough to warrant such a step, and it is to be hoped that their most sanguine expectations may now be more than realized. It is reported that Rev. Colin Anderson has struck a rich ledge of gold and silver bearing quartz on Eagle creek, in Roop county, Nevada.

San Bernardino.

MINING NOTES.—*Calico Print*, July 14: The Oriental are going down on the 300 level. Steam hoisting works running smoothly and a rich deposit of ore has lately been found; bullion prospects are looming up in this mine. Taggart has struck rich ore. Four tons of first-class milling at $534 per ton, and four tons second-class at $200. That bonanza of a mine the King, yet continues to roll out the silver thousands, and its black hive of a hill fairly hums with the busy workers down in the deep drifts. To the Oro Grande mill 40 miles away goes daily 20 tons of its rich ore. Ten tons of first-class ore from the Blackfoot mine, have been hauled to the station to be shipped to San Francisco. Ten tons more of what is considered to be $200-ore, remains on the dumps. The Garfield mine is coming out brilliantly, striking the rich ledges in every direction. The Bismark is still looking well. They have a 20-ton ship-

ment of ore ready for the mill. Last milling, 25 tons at $250. Messrs. Greer & Barrett of the O. K. mine, have lately developed some very fine ore, and will this week ship to the Pioneer mill five tons. This mine bids fair to stand with the best in our community. The Thunderer, ever indicative of its name, is booming night and day. The Humbug mine is laid up for cool weather. It has about a thousand tons of ore on the dumps. Invincible still at work with favorable returns. Hobbler, Alhambra and Odessa continue to report favorable. The Mammoth is vigorously at work in several new rich ledges. Several tons of very rich ore from the Snow Bird is being milled.

Shasta.

ABOUT WHISKEYTOWN.—*Courier*, July 14: The Phœnix mines show some good rock the Bell and Hubbell at Grizzly Gulch is also looking well. The Banghart continues to turn out the big clean-ups and is really becoming a most wonderful property, and the best of it is that the unearthing these nuggets is likely to become a prominent business. Mr. Stocking the superintendent, is working the claim in an economical, but at the same time in a thoroughly business-like manner. The Banghart will yet create a sensation in mining circles.

BACKBONE CREEK.—The Chinese are beginning to scatter over the hills, along the creeks, and wherever a sign of the precious metal can be found. As the railroad approaches our county, more parties from abroad are coming in to look at our mines. We have had many visitors lately who have gone away with a favorable impression of the gold and silver producing quality of the claims they have visited, and no doubt we shall hear from them shortly. The silver belt commencing at a point three and a half miles north from here extends about forty miles below, and seems to be the principal attraction.

Sierra.

COLUMBO MINE.—*Tribune*, July 12: This property is reported to have been sold. J. P. Deidesheimer bonded it several months ago for $20,000 and it is through his efforts that a company was formed to secure the mine. A force of men have been engaged here for some time past under the management of L. Berger and the prospects are flattering for opening out a big paying property.

THE SIERRA BUTTES.—This company is pushing ahead work on the foundation of the new mill to be built below No. 9 tunnel, on the river. They are doing an immense amount of dead work this year. Two hundred thousand dollars will probably be expended before any returns can be realized from the lower levels of the mine. It is reported that the company has found it necessary to levy an assessment recently.

ANOTHER BIG HAUL.—The Bald Mountain Extention Co. are working to an advantage in the South Fork ground at Forest City. Ninety-four ounces of dust was the result of last week's run. The South Fork Co. has already declared two dividends.

Trinity.

CLEANED UP.—*Journal*, July 14: Many of the mines in Trinity County have already cleaned up for the season while others are just concluding that operation. As nearly as can be learned at the present, the gold yield will fall considerably short of what is considered an average, attributable to the exceeding dryness of the winter 1882-3. For the quantity of gravel washed, the yield is considered excellent. Miners will generally go on and fix up their claims for next season, the prevailing belief being that it will be a wet one.

QUARTZ.—The farther down they go on the Blackmore ledge, the wider and better it gets. The first 16½ tons of rock produced $2500 while the last crushing of a little less than 16 tons ran close on to $3000. Water has given out for this season, but the work of getting out rock and developing the mine will continue and everything be put in first-class order for running when water comes again. Quartz prospects in Trinity are more promising than in any other section of the Pacific Slope. Deadwood district is producing its thousands every week and new mines are being discovered with a frequency that is most encouraging. Bullychoop district is coming to the front with several well developed and good paying mines proven, and others which give promise of good results in the near future. At East Fork but little work has yet been done, yet it shows that the ledges in that section are rich enough to pay well from the very beginning. Just at the present but little crushing is being done owing to the lack of water for running arrastras, but rock is being taken out and piled on the dump ready for crushing as soon as water comes. New mines are being discovered, and new arrastras erected all the time, from which we expect to hear good reports another season.

NEVADA.

Candelaria District.

NORTHERN BELLE.—*True Fissure*, July 14: There has been very little change in the appearance of the mine since the date of the last report. The work in the mine has been much interfered with in consequence of the celebration. About sixty tons of ore of fine grade are being extracted and sent to the mill daily. Both mills continue to run steadily and are accomplishing good work. The shipments of bullion on July account to the 12th inst. amounted to $14,326.49.

MOUNT DIABLO.—The stope near winze No. 1, below the third level, shows a foot of $70 ore that looks promising. A little $150 ore is being taken from the first level near the shaft. The bullion shipments for the week were: $4,243.36 on the 6th inst., and $9,163.79 on the 9th.

COLUMBUS CON.—The new hoisting works have reached completion, and will soon be out of the hands of the carpenter and machinist. The roof of the building and the smokestack are plainly visible from the town of Metallic, and look quite imposing as they rise above the intervening hill. The roof of the works is one continuous shed. A fine cupola surmounts the apex and from it shoots a nice flagstaff. The size and height of the building afford ample room for the machinery and gallows frame, as well as comfortable quarters for a carpenter shop. The hoisting engine is the largest in the camp, being the one formerly used in the Fairfax works, at Virginia City. The hoisting cables are flat, three inches wide, and each about 750 ft in length. A large, fine boiler is in position. The pumps and heater are conveniently placed. The supply of water is obtained by means of a pipe running into the works. The work of taking down the machinery, removing it here and putting it in its present place, was all done under the supervision of James Knapp, who has done a fine piece of work and himself credit. A blacksmith shop is situated at the rear of the building, and an office has been built near at hand. The sinking of the new shaft, over which the works stand, has been resumed, and will be pushed downward speedily.

MAKING BORAX.—The upper or northern end of the borax marsh, lying east and south of the town of Columbus, is once more a scene of industry. After a cattle period of about fifteen years, the manufacture of borax has received renewed activity. Some three or four companies have been formed and begun operations in real earnest. Material for tanks, boilers and other machinery arrives by rail quite often, and finds its way southward by means of teams. The advance in the price of borax has done much to increase the manufacture, and the field in the southern end of Esmeralda is almost inexhaustible.

Lexington District.

REVIVING.—*Pioche Record*, July 14: Mining matters in this old district, located in the southeast corner of White Pine county, are beginning to mend. The turn of the tide appears to have struck that place. Several men have been placed at work on the gold ledge, on which a shaft fifty ft in depth has been sunk, and the ore assays from $20 to $70, there being large quantities of it, and no dead work required in extracting it. There were a couple of men from Cincinnati there the other day looking at the property, and they decided to erect a gold mill at once. The district is well supplied with water.

Safford District.

ZANOLL.—*Express*, July 14: During the past week, three men have been at work in this mine, running a drift easterly on the ore vein at the 50-ft level, a distance of over 40 ft easterly and 45 ft westerly, making the total length of drift on this level over 85 ft. A vein of rich carbonate ore was encountered the whole distance. It is contemplated to start another drift at water level, 25 or 30 ft lower. Shipment of ores in large quantities from this mine will be in order in the very near future. Work on the Onondaga has progressed favorably during the past week. The shaft is down about 50 perpendicular ft. The stratum of rich ore on the south side of gouge is continuous, and the general appearance of the shaft at bottom is indicative of increase in magnitude of ore vein and grade of ore. The shaft now produces ore assaying as high as 201 ounces to the ton in silver. This continuance of vein of high grade ore at depth is a very encouraging feature of the camp. The tunnel and crosscut are progressing rapidly and are still in ore. The river is now fordable and cars on the switch at Gerald will be receiving ore from the Onondaga to-morrow or next day. A large number of sacks are already at the river ready to be taken across and emptied into the cars. The company expect to ship several cars to Salt Lake each week.

White Pine District.

VARIOUS MINES.—*News*, July 14: Fifteen men have been put to work on the Kinsley mines. The prospects there are very encouraging. R. G. Schofield showed us this week some fine gold prospects from his mine on the upper belt, west of town. He is energetically prospecting it. The Sweetwater Company at Hamilton have suspended work on their mines on Treasure Hill, and ore hauling has been stopped. They have about 250 tons of ore at the mill. They intend to put on a force at the Reserve, which is looking well.

ARIZONA.

COPPER.—Globe *Chronicle*, July 7: Last year Arizona produced over 17,000,000 pounds of copper. Thus far during the present year the increase has been 33 %, and new furnaces are going up. It will be a safe estimate that Arizona's output will be at least 25,000,000 pounds for 1883. The Old Dominion Copper Co. have bought all the property and plant of the Long Island Co., consisting of the Cuperite, Gray, Hoosier and Nevada mines, and the 30-ton smelter. It is probable that the furnace will be moved to the site occupied by the other Old Dominion furnaces, and that all four stacks will shortly be running steadily. We understand that the Old Dominion Co. also proposes to smelt copper ores for mine owners in the district, and that probably an additional furnace will be erected for that purpose.

ITEMS.—The wages of miners have been reduced to $3 at Russellville. The Head Center mine of Tombstone has shut down. The ore being taken out of the Cave creek mines, Maricopa county, shows very rich in gold, silver and copper, and the ledges are well defined and growing larger as depth is attained.

STRIKE.—*Epitaph*, July 13: In sinking in shaft No. 7, of the Toughnut mine a few days since at a depth of 60 ft an ore body was encountered which promises to rival the famous Combination body, from which over a million dollars worth of ore was extracted. So far this new strike has proven to be 12 ft across, and averaging 120 ounces, being of similar character and grade to that from the Combination. The ore body is continually widening, with every indication of a bonanza. Professor Church considers this the best strike since the Combination ore body was discovered. Being adjacent to Vizina and Mountain Maid, a fresh impetus will doubtless be given to development in those properties. The company is erecting a new concentrating mill in Charleston, with capacity of 100 tons per day, to be used in concentrating tailings, and an experienced concentrator will arrive this week to take charge of it. Fifty tons per day are forwarded to mill and smelter, supplied mainly by West Side, although Toughnut and Good Enough are yielding considerable amounts. The quantity of ore in sight to-day in the Tombstone Co.'s properties is greater than at any time in the past 18 months, and the prospects were never brighter. For the month of June the mill turned out $61,400, and the smelter $32,000. Mill and furnace both running regularly.

ABOUT PRESCOTT.—*Courier*, July 14: The Conger mine, Cherry Creek district is looking well. The owner is having a mill erected on the Verde river, five miles above Fort Verde. Mr. Lachman, superintendent of the Hidden Treasure, Turkey Creek district, expects to start his furnace, etc., in a month or two. Messrs. Morgan, Gavin & Roberts have in the neighborhood of $50,000 worth of ore sacked. They will ship it to San Francisco. All of this wealth has come out of a small shaft, scarce 23 ft deep. Messrs. Johnston & Pentland have men at work developing mines in Turkey Creek district. The Copper Mountain furnace will start again on or about the first of next month. The Silver Belt mine is yielding an abundance of rich ore. The miners of Castle Creek district are to be congratulated. They have had faith in the richness of their lodes, which will now be made to give up their wealth, as a smelter is up and ready to turn out bullion.

PROSPECTING AND EXPLORING.—A number of prospectors came in lately from the Hunchucas and report having made a good strike, displaying a large number of specimens that contained native copper in great quantities. The boundary expedition, mention of which has been heretofore made in the *Epitaph*, left Deming on Friday last. Lieutenant Thomas Symons commands the expedition and Texas Charley (G. C. Young) accompanies as scout. The expedition will reach the San Pedro river in about 10 days. It will make a reconnoisance of the line from the Rio Grande to the Pacific.

COLORADO.

LEADVILLE.—*Tribune*, July 14: The value of the ore shipped and the bullion produced here for the past three months amounted to $1,279,815.31. The product for the first three months of this year aggregated $3,602,602, making a total for the first six months of 1883, of $7,942,477, against $7,822,390 for the same period last year or a gain of $120,087. Considering the loss of time and decreased production occasioned by the destruction by fire of the Harrison smelter and the Tabor stamp mill, the results must certainly be considered gratifying. But for these casualties, the production would show at least a quarter of a million dollars more. The amount of ore on hand at the smelters is not included in this estimate. In making the above calculation lead is figured at $90 per ton, silver at $1.10 per ounce, and gold at $20 per ounce.

RED MOUNTAIN.—*Muldoon*, July 14: Red mountain is to-day the greatest and most wonderful camp on the continent. The entire district seems one mass of mineral, and strikes continue in rapid succession. Last week the Full Moon, Guadalupe, Grand Prize, Carbonate King and Maud S. and others were added to the list of producing mines; and while they are not as yet "Yankee Girls" or "National Belles," bid fair to add thousands to the output before snow flies. There is no camp in the history of mining that has ever produced as many paying mines as has Red Mountain, and the pay in many instances dates from the first stroke of the prospector's pick. Eastern capital seeking investment in mining industries generally look with distrust upon the assertions of local papers; but those who have read the *Muldoon*, since its origin know that we are exceedingly careful regarding mining news, and always disposed to surprise rather than disappoint. But Red Mountain needs no exaggeration, as the truth itself, to say the least, wears that garb.

IDAHO.

BAY HORSE.—*Messenger*, July 12: This is a lively camp this season. The rock work of the new stack, is completed, and the company is placing the water jacket in position. The old stack is running very smoothly, yielding about two tons of excellent bullion per day. The Smelting Co. have one kiln for coal finished and are going right on with more machinery and more extended improvements in all departments. The Spring Mountain M. & S. Co., intend to start their smelter on the 20th and expect to keep it running all summer. The mines are looking splendid over there. The S. M. S. & M. Co. have been busy repairing their tramway damaged by snow slides last winter. It is now running in good order and taking ore from the Alleghania and Big Windy to the smelter. They had made a new strike a few days ago in the Big Windy that shows an 8-ft vein of thousand dollar ore which they are running to the smelter. They are building a new tramway to there mines on Mineral hill where they intend to work a large force of miners this summer. It is their intention to push their mines to their utmost and try and keep their smelter running all next winter. The camp in general is looking better than was expected. There has not been a mine in the camp this spring that has not improved in richness and size.

MONTANA.

ABOUT BUTTE.—*Inter Mountain*, July 14: The Cable mine is being thoroughly re-timbered. The main shaft of the Mountain View is 440 ft deep. The old Longmaid concentrator has been started up on Bell ore. A gold mine at Yam Hill is producing ore which assays $2,000 per ton. The projected Drum Lummon mill will be the finest structure of its size in the world. The machinery will weigh 500 tons. Mr. W. A. Clark to day contributed for exhibition at Denver a handsome piece of Original ore weighing 150 pounds. It is a characteristic sample from a mine which for the past two years has paid regular monthly dividends of $3,000. The Anaconda company will send handsome specimens of copper glance to Denver, as will also the other copper mines. The amount of silver in the copper ore at Butte gives this district the advantages over all others. Important ore developments have recently been made in the Alice mine. The 800 level has been reached and drifting west for the main ore shoot has begun from the bottom. Sinking from the Magna Charta 500 ft station has also been resumed.

ABOUT BOZEMAN.—The mineral deposits daily evidence increasing value. Two coal properities just east of Bozeman have recently changed hands. The Chesnut mine is still owned by local capitalists, but a stock company has been formed. The Northern Pacific company has contracted for theentire output of the mine for five years, and will pay the owners five dollars for each ton of coal taken out. The product of the mine will be put on sale in all the towns of Montana east and west. The Maxey mine has also been sold to an English capitalist. It is one of the finest veins of coal in the west. The location of veins of more precious minerals is of every day occurrence. In Emerson district development proceeds upon the recently discovered lodes and there is every prospect of a rich camp. From 16 Mile, 60 miles north of Bozeman, comes report of renewed vigor in working the lodes long since known and recorded. The ore carries silver, copper and a large percentage of galena. The ore is very heavy showing it to be full of mineral.

YIELDS WELL. The Algonquin mill at Philipsburg is making a trial run on a 400 ton lot of ore from the Granite Mountain mine, from which according to present battery samples, it is expected 70,000 ounces of silver will be extracted. It is second class ore, too.

NEW MEXICO.

GEORGETOWN.—*Southwest Sentinel*, July 14: The Naiad Queen, and McGregor, the McNulty, the Satisfaction and in fact all the Georgetown mines are now steadily producing ore, and it is estimated that the bullion product this month will exceed $40,000. Trust Georgetown for keeping up her reputation as the leading producer.

RICH ORE.—John A. Miller made his first shipment of ore from the Columbia mine, of the Sierra Bella group at Lake valley, last week, and his returns have already come in. The figures upon the first-class ore are 1,840.5 ounces per ton; second-class ore returns, 616.7 ounces per ton. These are the figures upon mill runs. Mr. Miller has arranged with both the Benson and Kansas City smelters for carload lots, and will continue his shipments regularly. The mine looks extremely well, the ore body in sight being computed at fully 200 tons. The bed of coal in the Florida mountains is a genuine find, and will help to make cheap fuel in southern New Mexico.

OREGON.

TLEE-AL-UM MINES.—Yakima *Record*, July 6. This camp by the usual road is about 100 miles from Yakima city, principally north, and about 12 miles west. The first claims met with on ascending the mountain, is the Tlee-al-um. A little further up is the Foster, and still higher the Ilas, at an altitude of about 700 ft. The Tacoma Mining Company's interests are here. They own the Hawkins mine on the Tlee-al-um ledge and the Wilson on the Foster ledge. The ore is free milling, and bears silver and gold and assays $2 50 to $4 surface ore. This company has two men at work there and will soon increase the force. Mr. E. P. Boyles, Esq., of Yakima has large interests here and has a shaft 60 ft down with a favorable prospect. North from these ledges about two miles, and on Hawkins gulch, are the Silver King quartz ledge, the Madeline and Red Jacket. About half way up from the Burn to the Tlee-al-um ledge is the Ida Elmore. These also prospect well. There are 15 claims located in this district. During this season work will be prosecuted on most of them and it is thought the near future will see the Tlee-al-um an important camp.

SOUTH WESTERN OREGON.—*Times*, July 13: W. T. Clemons, who has been looking after the English company's mines at Galice creek, has removed from that section and will remain in town a while. He informs us that considerable prospecting is being done on Silver and Briggs creek, as also in quartz on Galice creek. The English Co. will probably operate their mines at Galice creek next season. Walter Simmons is building a big reservoir at that place and making other preparations for extensive operations next season. Wimer & Sons are cleaning up and a big yield may be expected from their mine. R. Cook has finished 300 ft of his tunnel at Steamboat and is going still further in. He expects to strike the lost bonanza in the near future. Doseles & Co, of Scotch gulch Josephine county, have finished cleaning up and no doubt did well. Sargent Bros., in vicinity of Steamboat, are doing well. Have found some fair size nuggets. I. Epperson & Co. of Steamboat are taking out considerable gold from their placer diggings. P. Fehely, and others, who have been prospecting in Josephine county have struck it rich at the head of Johnson creek. Wm. Griffin of Slate creek precinct, Josephine county, who is prospecting a quartz ledge in the vicinity of Rogue river, brought some fine specimens of ore to town last week. Jack Layton is now engaged in cleaning up at Applegate and will be occupied for several weeks to come. Notwithstanding the fact that water has been scarcer than usual, a large area of rich ground was piped off.

UTAH.

BUYING ORES.—Salt Lake *Tribune*, July 16: A. W. Foster while in Lake City, Col., buying ores for the Sandy Smelter, Utah, 12 miles south of Salt Lake City, offered $1.06 per ounce for silver, and 4½ cents per pound for lead; less $8 for treatment. Railroad freight is $8.

ITEMS.—The road up the canyon is being repaired by a big force. Two hundred men are engaged in mining in the district. The Maxfield mine is making regular daily shipments of rich ore. The nights are cold enough in the canyon to make fires comfortable. A large number of prospectors are looking over the hills this season. All the saw mills in the canyon are running, the demand for lumber is so great. The mining outlook has not been so promising in 10 years as it is at present. Salt Lake men have just located four claims and bonded four more in the vicinity of Argenta. The Silver mountain is building a road preparatory to shipment of ore. The strike is a huge one. The upper works of the Reed & Benson have been leased, and shipments will soon be made from that property. The snow in the gulches is much deeper than at this time last year, and in some places is from five to six ft in depth. The Irma, owned by Salt Lake parties, has a foot of 65 ounce ore resembling the Flagstaff. This mine should soon be able to ship.

BINGHAM CANYON.—The Frisco mine, Bingham, continues to take out a large quantity of ore daily. The company has 3,000 ft of tunnels, shafts, and raises, and ore every inch of the way in all of them. Their vein will average 30 inches all through the mine. Their lower tunnel, to tap the vein at a depth of 200 ft deeper than the present vein workings, is in 240 ft, and according to the survey they have only 30 ft more to run to strike the vein. Allan Donaldson, the superintendent of this mine, is doing good and faithful work. Reports from other mines in Bingham are all favorable.

THE RIGHT MAN.—Utah will be well represented in the Denver Mining Exposition, which opens on Tuesday next. Prof. Clayton will be there to spread our productions before the eager gaze of thousands. No more suitable man could have been chosen for this service. Talented, learned, and upright, Clayton will in the discharge of his duties reflect credit on the Territory. In honoring such a man Utah honors herself!

Colliery Accident Relief Funds.

That colliery accidents cannot be entirely prevented is acknowledged by all who are practically acquainted with the business of coal mining; so that to provide for the survivors, when these calamities do occur, would appear to be not only praiseworthy, but an imperative duty of colliers and colliery owners alike, for it is an indisputable fact that, although the public come forward and subscribe liberally upon the occurrence of these unusually fearful accidents, which result in the sacrifice of many lives, by far greater misery is caused by the more frequent fatalities which deprive but one or two families of their bread winners. It is to meet these cases that the fatal accident relief societies have been proposed in various districts, for, as it is truly said, these associations will provide not only for the few fatal accidents which awaken public sympathy, but also for those minor cases which at present escape attention. The object of the Midland District Miners' Fatal Accident Relief Society is to provide for the widows and children of married members, and for the payment of legacies to the relatives of unmarried members who may be killed by those casualties which are of such frequent occurrence in and about coal or other mines or quarries, and a sum to defray the funeral expenses of members accidentally killed in and about the pits. This society, which it is explained is essentially a workman's society, will relieve all the local clubs of the death-rate and consequent liabilities, and will not interfere in any way with the present working of them. The committee earnestly recommend each and every member to look anxiously after the interests and welfare of the fund, and, individually and collectively, endeavor to further and advance and assist each other in carrying out the aim and objects of the society and the principles laid down in the code of rules, bearing in mind that men who are dependent upon their own hand-labor for the maintenance of themselves and families, are in duty bound to lay by something to provide for their wives and children.

To entitle a society of this kind to support from the general public it must be shown to be essentially a benevolent society and altogether unconnected with trade questions, such as from time to time arise between masters and workmen. In this respect the Midland District Miners' Fatal Accident Relief Society affords by its rules all the guarantee that need be desired. Its operations extend and are confined to the districts of Derbyshire, Nottinghamshire, Leicestershire and Warwickshire, and it is provided that all moneys received on account of contributions, subscriptions, donations or otherwise shall be applied towards carrying out the objects of the society, which, it is explained, are to provide a sum payable on accidental death and for the relief or maintenance of the widows and children of ordinary members who may be accidentally killed in or about coal or other mines or quarries. With regard to the benefits offered to the miners connected with the society, the rules provide that when any full member or half member meets with an accident causing loss of life, the funeral allowance shall be £5; there shall be allowed in addition for an unmarried full member, £10; and for an unmarried half member, £5; and to the widow of a married member, the sum of £2 10s in addition to the funeral allowance of £5, and the sum of 5s per week; the allowance to continue so long as the recipient conducts herself with propriety, to the satisfaction of the society. Any widow re-marrying shall be paid the sum of £10, in lieu of the weekly allowance; but such re-marriage shall not affect the allowance to the children. Notwithstanding the foregoing scale of allowances, the board shall have power, under special circumstances, and at their absolute discretion, on the application of the person interested, to commute the above allowances for such fixed sum as they may think reasonable. Each child of any married member, whose life may be lost through accident, shall receive an allowance from the funds of the society of 2s 6d per week. The payments to children to continue until the sons attain the age of twelve years and the daughters the age of thirteen years.

It must be obvious that such handsome benefits could not be offered in return for the comparatively small contribution of the working miners; but the stability of the society is insured by the strength which it derives from its honorary members, who are interested in the miner's welfare. The rules provide that all persons shall be eligible for admission as ordinary members, who are employed in the district in or about coal or other mines or quarries; and on payment of the contributions, hereinafter set forth, they shall be ordinary members, and entitled to the benefits of the society. All persons not being owners or lessors of mines and quarries, who assist in supporting the society with an annual subscription of not less than one guinea, or a life donation of not less than ten guineas, and all owners, lessees, occupiers, or workers of mines and quarries, who subscribe not less than twelve and one-half per cent on the amount paid by the ordinary members in their employment, and all lessors of mines and quarries who shall subscribe annually not less than ten guineas, shall become honorary members. Honorary members have the right to take part in the proceedings at any meeting of the local agency with which they are connected, and are eligible to hold any office in the society; but they have no claim to any benefit or emolument from the funds of the society. And there is a great inducement to acquire honorary membership from the advantages secured for one's workpeople, since if a member meets with a fatal accident, while working at a colliery, or mine, or quarry, where the owner, lessee, or occupier is not an honorary member of the society, the benefits under the rules are reduced to twelve and one-half per cent or one-eighth.

The constitution of the society has much to recommend it, and the rules are framed with judgment and care, so that it may be anticipated that the society will prove permanently useful and successful, and afford all those philanthropically inclined a ready channel for contributing to the relief of the bereaved and destitute.—*London Mining Journal.*

Return Air in Mines.

The London *Mining Journal* says: The Royal Commission on Accidents in Mines appears to have overlooked one most important item in the investigations in which they have been engaged during the last four years, and which has not yet terminated. In the preliminary reports they have given not a word has appeared with respect to the air in its chemical aspect as it is found when it has performed its duty in neutralizing the effects of gases and ascends to the surface. Our attention has been drawn to this by the action of the Prussian Fire-Damp Commission which is now actively at work, and issues notes of what is being done, showing that the investigations will be of the most thorough and practical character. One branch of inquiry in which great interest is taken is the chemical examination of the air from the upcast shafts of a number of German mines. The nature of the air, of course, would depend a good deal upon the gases that are given off, and in some mines there would be scarcely any, and in others a considerable quantity. As a rule, however, the German mines do not give off anything like the quantity of gas that a great many in this country do, for, at not a few of these, even in the early morning, it is not an unfrequent thing for the men to waft the gas away with their caps and jackets before commencing work. It may, therefore, be fairly assumed that were the return air in some of our mines examined it would be found to contain a much larger proportion of fire-damp than any of the mines in Germany. Yet we are told that Dr. Schondorf, of the Bochum laboratory, found the air coming from the upcast shaft of a mine in Westphalia contained 1.05 per cent of fire-damp, although the ventilation going on was at the rate of 30,000 cubic feet of air per minute.

At another well-known mine in Germany the air was impregnated with no less than 1.5 per cent of fire-damp, where over 500,000 cubic feet of air was sent through the workings every minute. Even these returns show how a mine might gather such an amount of gas, owing to an interruption of the ventilating current, that would lead to an explosion in a very short time. This will be evident when we repeat that a mixture becomes in the highest degree explosive, when the fire-damp is one-ninth or one-eighth of the total volume. Therefore, by chemically examining the return air, the state of the mine, so far as gas is concerned, is easily ascertained. If there is a high percentage of gas, it shows that the ventilation is not sufficient, and that the mine is by no means a safe or healthy one, and that an immediate remedy should be applied in the shape of an increased quantity of fresh air being sent from the surface, or by splitting the current. A record of the state of the air as it comes from the workings up the up-cast shaft of the principal mines in the districts in England and Wales that are termed "fiery," is highly desirable for many purposes, and could not fail to result in improved systems of ventilation, and in increased comfort and safety to the workmen. The Royal Commission has not yet sent in its final report, and, before doing so, it is to be hoped that it will follow the example of the Prussian Fire-damp Commission by investigating the chemical properties of the air from the up-cast shaft of certain mines in districts where they are known to give off considerable quantities of carburetted hydrogen gas. We have no doubt the Home Secretary would look upon such an addition as a most valuable portion of the report, as we feel sure all our mining engineers would do also.

NEW MONTANA DISTRICT.—A promising mining district is being opened in Montana, about 25 miles west of Bozeman, and across the Jefferson river. The discovery cannot properly be called a recent one, as a claim was staked off there 13 years ago. But this spring several miners went to prospecting the district, and the result is some 30 locations have been made. Specimens are on exhibition, and the indications favor a good mining camp. The ore carries gold, silver and copper, the latter predominating. Assays of the latter metal have given from 18 to 70 per cent, and as high as 240 ounces of silver have been received. The veins are about eight feet wide, and have one well-defined wall, the other being somewhat broken and irregular. As there is not a 20-foot shaft in the district, but little can be said, but there is every assurance that some big mines are going to be opened up.

PROSPEROUS MINERS.—It is estimated that the miners and mechanics of Butte, Montana, have on deposit at the three banks of that city about $900,000.

The Gold Fields of Venezuela.

The encouraging mining operations now being carried on with British capital in Venezuela, and especially in the province of Guayana, have several times been referred to in the *Mining Journal*, and it must be particularly gratifying to those whose funds are embarked, to find that local opinion is quite in accord with that expressed in this country. It appears that Venezuela is each year acquiring a more prominent position, and that the growing prosperity will be equally shared by Venezuelan and British capitalists. The returns published in the Trinidad *Royal Gazette*, showing the values, duties paid, etc., of the imports and exports during the past year, are highly instructive to those who have at heart the interest of this thriving colony. It will be noticed, says the *New Era*, of Trinidad, how largely Venezuela figures in these statistics, both in the imports of her gold and the various manufactured goods and other supplies forwarded there by our merchants. Little public notice has heretofore been taken of Guayana and its auriferous region, the product of the latter being now the foundation of all the business in the neighborhood of the Orinoco, and, in fact, of the State. It is an undisputed fact that these mines are the richest in the world. Who has ever heard of a district with the limited population which Caratal has at present, producing upwards of £600,000 worth of gold per annum? This amount is gradually increasing, and no doubt the ideas of our great explorer (Raleigh) have been realized—that the gold fields of Guayana is the veritable El Dorado. This island is the key to the Orinoco; it is the base of supplies.

What a great interest we should take, therefore, in watching and assisting in developing that wonderful land. Some will say we know what these mines are; we went into some foolish speculation and lost our money; but the occurrence of one mine turning out unprofitable is not sufficient evidence to condemn generally a country which has such a great future before it. Referring to the older-discovered mining districts, where are situated the fabulous El Callao Mine, the Chile or Tigre, have not these proved that there is quartz more highly auriferous than any known gold diggings in the world. Then in the later opened region, south-east of Callao, there is the Mexico, San Pasquale, La Cruz, and the Victoria; all of these are producing, it is said, gold quartz which bids fair to equal, if not eclipse, the older mines, and gold mining is as legitimate as any other enterprise when managed in a business-like way. Gold mining has been the foundation of the success of all our eastern colonies, notably in Australia and New Zealand. Why, therefore, when we have a country so near us which, though comparatively undeveloped, is rich, we say, should not more public interest be taken in proving that Guayana is a place well worthy of attention as a field for mining enterprise? By so doing, says the *New Era*, in conclusion, we think the golden sands of Yuruari will be gradually washed more and more this way, and ultimately make the Port of Spain the Melbourne or San Francisco of the Antilles.—*London Mining Journal.*

Mountains of Mica.

A New Mexican exchange says: Much has been said and written about the mica found in the mountains west of Las Vegas, and many may imagine, because there has not been already a large, profitable output, that the expectations at first announced have been met. Such is not the case. On the other hand, mineral of excellent quality, and in paying quantities, has been found in place in more than one locality. Unfortunately for us, however, the parties who have undertaken the mining of mica in San Mignel county upon a large scale, with ample means to prosecute development work, do not possess the best property, or rather that upon which the best showing can be made in the shortest time. Others who have really very promising claims, however, have not the means to work them, but are holding them at higher figures than can be obtained every day in the year. Few people understand the value, method of working, and characteristics of mica mining, but those few experts who have examined the prospects in this county have reported favorably upon them, and it is only to be regretted that more active operations have not already been begun. Upon the other slope of the range prospects lying in the same belt and formation have been sold to Ohio capitalists, who formed a company called the Mansfield Mica Co., and several large contracts with Eastern stove manufactories have already been entered into. The mine is located in the northeastern portion of Santa Fe county. The product will be shipped via Espanola to Mansfield, and there resorted and boxed for shipment to the factories.

A. N. E. Peterson and others, of the hot springs, have, within the past few days, made locations of mica mines near the source of the Gallinas, and it is their intention to work them promptly. There is certainly a large industry open for capitalists in this subject.

THE VALUE of the raw materials of hardware is as nothing compared with that of the finished fabrics. A chain was manufactured which weighed only two ounces and cost $170, being 963,600 times the value of the original iron from which it was made.

Quartz Mining in Amador.

A correspondent of the Amador *Dispatch* says: As quartz mining is one of the principal interests in Amador county, and in which I have been engaged for the past thirty years, I send you a few notes for publication in your valuable paper on that subject: The first location for quartz mining in Amador, was made at Amador City, in March, 1851, by Glover, Fitzwaters, Rogers and Dover, who located the old Amador and Spring Hill claims, and many other claims were located on the extensions. The Alpine, at Plymouth, by John Southerland, the Empire, and other claims were located in 1851. The quartz veins in the northern part of the county, have been prospected and worked for the last thirty years, and large sums of money expended in prospecting to secure paying claims, but the most of the locations have been abandoned as worthless. The value of many claims have been misrepresented, which is working a great injury to claims that are really valuable. Many locations are only made for speculating purposes, and are "wild-cat" claims, represented as valuable to victimize innocent purchasers. What is known as the "mother lode or lead," extending from the Mokelumne river to the Cosumnes river, including the locations at Jackson, Sutter creek and Amador, Drytown district and Plymouth are all on the west lead blue ribbon rock, and there is no other in this State. No other quartz belt that has as yet been found, has rock like this blue ribbon rock, or has ever been made to pay by mill process. East of the Empire or blue lead, in the Plymouth mining district from Dry creek to the Cosumnes river, there has been ten quartz mills built on east leads of the blue lead, and every one has proved a failure and been abandoned as worthless. East and west of the mother lode, as far as I know, the quartz leads have a pocket formation, and have never paid for working by mill process, and, in my opinion, cannot be made to pay, but must eventually be abandoned as worthless. For more than thirty years I have been interested in quartz mines, and my personal interest would deter me from doing anything to retard or injure the development of the mining interest; but I think the location and efforts to sell worthless mining claims to capitalists is a detriment to the mining interest and prevents capitalists from purchasing claims that are valuable. The most successful mining capitalist in this county is Alvinza Hayward, commencing at Sutter creek, on the mother lode, and he still sticks to the mother lode or blue ribbon rock lead in his Plymouth mines, and has followed it up to the Cimrch Union in El Dorado county.

It is not the wish of the writer to discourage prospecting for quartz mines, but on the contrary I have always given all the information and encouragement in prospecting that I could. But capitalists have been fooled so often in this county that they are now afraid to invest in mines that are known to be valuable and paying claims.

A SLICKENS RANCH.—The Nevada City *Transcript* has this to say about a slickens ranch near that city: About eight acres of the ranch is where there was but a few years ago a ravine that served as an outlet to various mines. Mr. Getchell built a brush dam across it, raising the structure as the tailings from the mines piled up above it, until now the surface is forty feet above the original bed of the stream. From this made ground the owner annually cuts an average per acre of from six to seven tons of timothy and clover. No other land in this part of the State produces such wonderful crops as does that slickens deposit. It needs comparatively little fertilizing, and does not "wear out" like ordinary soil.

LIQUEFIED CARBONIC ACID.—The use of liquefied carbonic acid in the preparation of carbonated beverages is recommended by Mr. Apotheker Volk, of Ratzeburg, who states that experiments have proved it to be the purest, most suitable, and best method of impregnating mineral waters. It is also claimed that by using the carbonic acid in this form the more expensive part of the apparatus now used in the manufacture could be dispensed with. The great disadvantage however, lies in the fact that liquefied carbonic acid requires a pressure of thirty-six atmospheres to hold it in that condition at zero of centigrade, which pressure rapidly increases as the temperature rises.

THE USE OF OILSTONES.—The proportions of glycerine and alcohol to be used on oilstones vary according to the instruments operated upon. An article with a large surface—a razor for instance—sharpens best with a limpid liquid, as three parts of glycerine to one of alcohol. For a graving or any similar tool, the cutting surface of which is very small, as is also the pressure exercised on the stone if sharpening, it is necessary to employ glycerine almost pure, with but two or three drops of alcohol.

GAS FLAME LIGHT.—The amount of light given out by a gas flame depends upon the temperature to which the particles of solid carbon in the flame are raised, and Dr Tyndall has shown that of the radiant energy set up in such a flame, only the 1-25th part is luminous: the hot products of combustion carry off at least four times as much energy as is radiated, so that not more than one hundredth part of the heat evolved in combustion is converted into light.

Gold Quartz Mining.

Mr. Thomas Cornish, M. E., the well known writer on mining, says:

In Sandhurst (Victoria), the noted quartz mining region of the colony, there have been many instances of marked success in gold mining, not only to many joint-stock companies, but several private mine owners, who have been exceptionally fortunate in striking rich reefs in their claims, have become millionaires, and are still in receipt of enormous incomes.

The system inaugurated for developing the resources of the district was in the early days such as tended to retard rapid development, and caused much waste of time, capital and labor. The claims were too small, and consequently caused the sinking of more shafts than was necessary for efficient working. In many places I have seen ten or twelve shafts sinking on or for a lode where there only ought to have been one—a good main shaft, a suitable size for going down to a great depth. Many companies were in existence for years sinking a shaft to a depth of 300 to 400 feet, dawdling over the work by only employing a few men, where with energy and at less cost the same work might have been done in a year.

When progressive or prospecting labor is determined on, it should be pushed on with all expedition possible, as the quicker the results are proved, the better and cheaper will it be for those who have to pay for it. Thus in shaft sinking as many men should be kept below as can conveniently work. There is no more surface labor required for four, five or six miners working in a shaft than there is for two, while more than double or treble the work gets done during the same time.

In quartz mining, it is generally necessary that the main shaft should be kept continually sinking, while levels should be opened for development at intervals of from sixty to one hundred feet, as experience may guide the manager. The neglect of keeping progressive work well ahead is oftentimes attended with much loss, not only in time wasted, but in depreciation of the value of the mine.

One of the greatest wonders in connection with gold mining industry, when any new discoveries have been made, and a rush sets in for investment, is the surprising rapidity with which mushroom authorities spring into existence. Men who by a fluke have made a lucky speculation in shares, or obtained a concession or claim in or near a locality where gold might have been seen or expected to be found, arrogate to themselves the position of oracles or authorities on the subject of gold mining, and impudently assume a knowledge of an industry that can only be acquired by long practical experience and intelligent application.

Men who never saw a gold mine, and know nothing of the proper method of working one, will write reports and undertake the control of works of which they are completely ignorant. The natural result follows that large sums of money become squandered in the purchase of mines at fabulous prices, and afterwards wasted in disgraceful management. At the expense of the shareholders and their unfortunate dupes, these mushroom authorities enjoy a butterfly existence during a brief period of sunshine (while the money holds out), when they suddenly collapse, and fall into the obscurity from whence it is a pity they ever emerged. The mischief created by these new-known authorities on gold mining, is, however, incalculable, as it is not merely the money they waste in gaining experience and making a muddle of everything at other people's expense, but their utter incapacity brings discredit upon the industry of gold mining generally, and retards the development of legitimate mines by experienced persons.

The reports which have appeared from some of the so-called managers of mines in India and west Africa from time to time since the rush set in for mining in those places have been enough to condemn the writers as utterly incompetent for the positions they have undertaken, and the shareholders are beginning to find out to their cost the mistake they have made in their selection of directors and managers, whose chief qualifications have been bumptiousness and entire ignorance of the practical details of gold mining.

PROGRESSIVE INDIANS.—The Piutes at the Pyramid Lake reservation, Nev., are showing considerable progress. They have dug five miles of ditch for irrigating purposes this year, and will raise 1,000 bushels of wheat this summer. A number of children are attending the boarding-school, begun last fall by direction of the Government, and many of them can read, write and do some work in primary arithmetic. They are also taught to cook, sew, etc., and have made considerable progress in this direction. Mrs. McMasters has charge of the school, and Mrs. Mapes is matron. Religious service is conducted on Sunday by Mr. Aibby, the Baptist minister of Wadsworth. The services are well attended, and the Indians are generally respectful and attentive.

A METAL EXCHANGE has been established in New York. Forty-four applications for seats were received in one day. The initiation fee is $350. Regular daily calls are made, and contracts for pig iron will, it is believed, be fixed at the minimum of one hundred tons, with margins at $2 per ton. Storage arrangements, which will reduce the cost of carrying pig iron, are being made.

USEFUL INFORMATION.

Musty Smells in Untenanted Houses.

It is a cause of much wonder among those who do not study the subject, why a comparatively new house, after being in use a short time and then left vacant a few weeks, should be so impregnated with bad smells and foul atmosphere as not to be endurable for habitation until the house has been thoroughly ventilated.

A little study will lead one to soon arrive at the reason for such musty odors. The parties last inhabiting the house may have left it in perfect order according to their ideas of cleanliness; as far as outward appearance was concerned, nothing could be detected to lead anyone to suppose that the musty smell generated would soon be in running order.

We can best illustrate the *modus operandi* of these generators by the following description, as furnished us by the owner of the premises: "The house had only been built a little more than a year. At the expiration of that time it was to undergo a thorough change. A servant was left to sweep out and clean up generally. After a thorough (?) sweeping, the windows were washed and the almost muddy water dumped into the kitchen sink, instead of being thrown into the yard hopper. The shelves in the pantry were washed, and the water also emptied in the sink. Instead of letting a bountiful supply of water run, that the trap might be thoroughly cleansed of filth, the girl simply used the cloth in brushing the water down the sink and forcing the thicker portions through the strainer.

The same thing was done up-stairs; windows and shelves washed, and the dirty water dumped into the wash basin, a cloth used to wipe the basin clean, and all was right. We prefer not to put in print what took place in the bath-room. To all appearance the house looked clean. The servant went through the house, shut and locked every window, and left the death-dealing musty smell generators at work. My advice to leave the windows open was not regarded, and as the time would not be up for several days for me to take possession of the premises to make the necessary alterations, I had no authority to leave the windows open.

Of course the gas fiend was soon at work. The filth left in the traps, the dirt on the shelves, wet and but half washed, etc., soon began to putrefy; the absence completely of fresh air from the windows being closed, helped on the decaying mass, and a lively ferment took place. With such generators of musty and foul vapors, is it any wonder that in a short time the house was filled with a noxious atmosphere?" We are sure, when we visited that house some days afterwards, even after sending a boy the day beforehand to open the windows all through the house, that we were met with, on opening the door, a smell that put us in mind of a certain story where a river had to be turned from its course in order to purify certain stables.

Landlords would be well paid after a tenant has left a house to immediately give it a thorough sweeping; allow the water to run several minutes in all the sinks, basins, and waterclosets; if there be a cellar, see that not a particle of vegetable matter is left around; leave a window in every room open; scatter a little chloride of lime in the cellar, and place some in a saucer in the bath-room and kitchen. It will take you but a few hours to follow these suggestions, and only a few dimes' worth of materials to carry them out. Your house, even if idle for quite a time, will be sweet and wholesome, and the little labor you have spent will be well rewarded by the praises of your new tenants upon the nice clean house they have secured.

RE-PAINTING AN OLD WAGON.—Some one recently asked the *Blacksmith and Wheelwright* if it was possible to make a good job of painting an old cracked or sealed wagon without scraping or burning all the old paint off. That journal replies as follows: "When a body is slightly cracked, it may be pasted over with putty made of dry white lead, japan and rubbing varnish, put on with a wide putty knife. After it gets perfectly dry, grind down with hard pumice stone and water. For burning off a body I use the alcohol burner. It costs about $4.00, but is the best burner I ever saw. For cleaning off the grease, I use an old half-round file, ground up to an edge. Scrape all off clean, sand paper, and paint up as a new job. In painting over old paint that has commenced to scale off, it will continue to do so and throw off the new."

NO ADVANTAGE.—The usual ways of adding to the transmitting power of belts are by applying to them oil, rosin, or some adhesive substance, and by tightening them on the pulleys. The use of oil, rosin, etc., results in a direct waste of power, for, as it gets old, it becomes gummy, and the belt sticks to the pulley, requiring a more considerable power than is generally supposed to separate it, and effectually neutralizes all the advantage sought to be gained by its use.

AN OIL for belting is recommended which consists of nine parts of linseed oil and four parts of litharge, ground in water. These, boiled to a plastic consistency, then liquefied by an addition of turpentine, furnish an oil which, it is claimed, promises many admirable qualities.

UTILIZING BURNING CULM-PILES.—An interesting application of a patent analogous to those for utilizing the waste products of coke, recently taken out by Mr. H. L. Armour, and the property of the Jameson Coke Company (limited), has just been made in the case of a pit-heap at Seaton Burn Colliery, in Northumberland. A pit heap is a deposit for quantities of small coal and dust, for which, as a rule, no market can be found, as well as for shale and iron pyrites met with in working the coal. These heaps are generally burning, and in very many instances, give off so much smoke and dirt as to become a terrible nuisance to the neighborhood. This was the case at Seaton Burn; but by simply covering the heap with sand, and sinking a number of iron pipes connected with a main, in which a constant suction is maintained, all offense has been removed, and a stream of gas, yielding both oil and ammonia, is obtained. In this manner a worse than valueless property has been converted into a profitable one, and, as the system is now in course of extension to large heaps at Kelvinside, near Glasgow, it is to be hoped that before long an end will be put to one of the greatest nuisances in colliery districts.

BENDING PLOW HANDLES. No special machinery is required for bending plow handles, further than a wooden form to bend over, and an eye to hold the end, with a hook to catch the long end and hold it, all of which may be home-made. The timber does not require to be seasoned. The handles, if green, require steaming long enough to heat them through, possibly one hour. If they are dry, they should be soaked in warm water at least one day before steaming; then two or three hours' steaming should be enough. Much depends upon what kind of timber the handles are made of. Those who make a business of bending and making plow handles make them double to prevent splitting the ends by bending close to the end, and afterward cut them. Often a piece of band iron is placed on the convex side of the wood, and bent with it to prevent splintering.—*Wood Worker.*

FIXING LOCKS.—When it is not convenient to take locks apart in the event of keys being lost, stolen or missing, and it is desired to fit a new key, take a lighted match or candle and smoke the new key in the flame, introduce it carefully into the keyhole, press it firmly against the opposing wards of the lock, withdraw it, and the indentations in the smoked part of the key will show exactly where to file.

THE RUBBER PLANT IN MEXICO.—Mexico is making a study of the culture of the rubber plant. The hardiness of the plant is said to be such that its culture is exceedingly simple and inexpensive, where the climate and soil are suitable. In much of the Mexican coast region the only expense is the weeding required, when the plants are young, to give them a chance to grow and strengthen.

GOOD HEALTH.

Dyspepsia—Variety in Human Stomachs.

Dyspepsia, which is so much complained of and seems to be so widespread, arises from various causes, and is cured in various ways. Many people imagine that the internal organs in all individuals are the same, and that like treatment will produce like results in everybody. The internal organs are alike in different people just as their faces, hands, feet, figures, are alike. A celebrated surgeon who has attended a thousand autopsies, says that the aspects of the inside of bodies vary as noticeably as the aspects of the outside of the same bodies, and we know that the variations in these are infinite. It is very rare that we find the hands of any two persons agree exactly in form, proportion, color, symmetry, even though the same number of glove may be worn by both. The same thing is true of the other external members of the body, and equally so of the internal organs—the heart, the lungs, the liver, the stomach, and all the rest. Just as a man must have his clothes made to order if they are to be a perfect fit, just as he must have his own last for his shoes, and his own measure for his gloves, so he must fit his stomach with food "convenient" for it.

"I've tried to eat oatmeal and vegetables and graham bread, and do without meat and fine flour," said an author to an expounder of hygienic living on the vegetarian plan, "but I can't write on such food. I must have a generous diet or my brain won't work." The professor was a man of sense, and looking over the complainant carefully, replied: "Your stomach is small and you need concentrated foods; meat, eggs, and fine flour with fruits are your proper diet." A person with a large stomach and a vigorous circulatory system can absorb large quantities of plain cold food and find nutriment and comfort in it. To such a person, condiments are superfluities, but with a person of limited capacity of eating and feeble circulation, warm food and vegetables are not only grateful but necessary. Even sheep like spicy bushes, and when they are permitted to run wild in the woods, regale themselves on aromatic herbs and shrubs, and by this food their flesh acquires a gamy flavor.

The kind of work a person does largely determines the quality and quantity of food he requires. Corn bread, cabbage, pork, onions, potatoes, apples, supply the necessary elements wanted by the average workingman in the open air; but the man who uses his brains as well as his hands, and works indoors, will not thrive on this diet, and he who uses his brains and not his muscles, will not find it at all suited to his needs. What he will find suited to his needs he can determine only by experiment, and this is true, more or less, of every individual. To one, oysters are an active poison; to another, strawberries; to another, onions; to another, cheese; and yet these foods are good for the majority of eaters. Some can make a satisfactory meal of one dish; others require a variety of dishes to keep their stomachs complaisant. The same person under one set of circumstances will relish and digest foods that under others would be abhorrent and sickening to him. One who has been surfeited with rich and varied bills of fare, will settle down to the mush and brown bread of some "Cure," and thrive on the diet. He has been overfed, and now it benefits him to be underfed. Another, who has had his fill of lean fare at home, will loath the mush and brown bread, and suffer indigestion from eating it. One who has enjoyed a choice of dainties may possibly find "hog and hominy" tolerable when "roughing it," but a steady adherence to this dish will cause dyspepsia in the toughest stomach.—*N. Y. Tribune.*

The moral of the above is, that as stomachs are as unlike each other as faces or dispositions; so each must acquire that wisdom which will enable him to be perfect master of himself and govern his taste and appetite according to his own peculiarities of constitution and needs.

Baldness.

In an article recently contributed to the *Gesundheit*, a paper, as its name imports, devoted to sanitary subjects, Professor Reclam, a German *Gelehrter*, makes some timely and useful observations on the subject of baldness. After describing, in a vein of pleasantry, the vast array of bare polls which may be seen any evening in the pit of a theater, or the body of a lecture room, he discusses the causes of baldness. He does not think, as is sometimes said, that loss of hair is the result either of impaired health or of much study. The strongest men are often bareheaded, and German professors, who care nothing if not studious, are distinguished above all men by the profusion of their locks. On the other hand, soldiers and postilions, who wear heavy helmets and leather caps, and wear them a good deal, are frequently as bald as billiard balls. From these facts Herr Reclam draws the conclusion that baldness comes chiefly of the artificial determination of blood to the head, and to the heat and perspiration thence arising. The result is a relaxed condition of the scalp and loss of hair. If the skin of the head be kept in a healthy state, contends the Professor, the hair will not fall off. To keep it healthy the head covering should be light and porous, the head kept clean by washings with water, and the hair cut short. The nostrums vended as hair restorers, and on which a fabulous amount of money is wasted by the ignorant for the benefit of quacks, he denounced as worse than useless. In ninety-nine cases out of a hundred they are worse than useless. Cleanliness and cold water are the sole trustworthy specifics; but when once the hair roots are destroyed, not all the oil of Macassar, the bear's grease of Siberia, nor the cantharides of Spain will woo back the vanished locks.

POISONOUS FLOWERS.—Every summer, when the beautiful oleander is in bloom, some cases of persons being poisoned by this flower have been recorded. Last year a young lover at Oroville was nearly fatally poisoned, by chewing the leaves of an oleander boquet, given him by his sweetheart, and a young gentleman and lady, at Marysville, came near climbing the "golden stairs," by chewing the twig of an oleander bush. This flower is usually of a rich, pale red, but is sometimes white, and is a lovely, sweet scented bloom; but the wood and all parts have a poisonous action, resembling that of digitalis, and is best treated by a judicious use of stimulants. The first instance of poisoning this year, has just reached a *Record* reporter, who was informed by a person conversant with the facts. One evening last week, a young lady named Sadie Meeker, residing with her parents, near Vina, carelessly chewed an oleander bud. In a short time afterward she was taken deathly sick, and probably would have died had not medical assistance been immediately brought from Tehama. Her mouth and face were distorted out of recognition, and the pains suffered by the girl were most intense. Happy to relate, though, she is now recovering, but her once pretty mouth now looks like a piece of raw liver.—*Chico Record.*

THE ISTHMUS OF CORINTH CANAL.—By the canal through the isthmus of Corinth, which will probably be finished in less than five years, vessels from the Adriatic ports will save 185 miles, and those from the Mediterranean 95 miles. There is also an advantage in avoiding the dangerous coasts in the vicinity of Matapan. The canal will be four miles long, seventy-two feet wide, and twenty-six feet deep at low water.

"HELIUM."—Professor Palmeri announces the discovery in the lava of Vesuvius, the substance giving the spectrum line of "helium," an element hitherto recognized in the sun. Efforts will probably be made to isolate it.

TABLE OF CONTENTS.

EDITORIALS.—The Dyer Cannon Ball Quartz Mill; Working Miners and Bullion Production; Product of Quicksilver During the Past Year, 33. What the Report of the Director of the Mint Shows; Improving on Further Acquaintance, 40. Iron and Civilization, 41.
ILLUSTRATIONS.—Dyer Cannon Ball Quartz Mill, 33. Apparatus for the Analysis of Furnace Gases, 41.
CORRESPONDENCE.—Ross Camp; More About Nickel, 34.
MECHANICAL PROGRESS.—Destruction of Steam Boilers; Finishing Files by Sand Blast; Rolling Cold Iron; How to Anneal Small Castings; Growing Competition of the Gas Engine; Cutting Steel with Soft Iron; Is it Possible to Cast a Chain; Case Hardening; Progress of American Carriage Industry; Effects of Compression on the Hardness of Steel; Lubricant for Heavy Bearings; American Plumbing, 35.
SCIENTIFIC PROGRESS.—Photographing the Solar Corona; A Remarkable Samarian; French Academy Prizes; A New Food; To Determine the Quantity of Moisture in Walls; Photographing the Vocal Organs; Electricity; Power of the Waves; Rainbow Glass, 35.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 36
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 36-7.
USEFUL INFORMATION.—Musty Smells in Untenanted Houses; Repainting an Old Wagon; No Advantage; Utilizing Burning Culm-Piles; Bending Plow Handles; Fixing Locks; The Rubber Plant in Mexico, 39.
GOOD HEALTH.—Dyspepsia—Variety of Human Stomachs; Baldness; Poisonous Flowers, 39.
NEWS IN BRIEF—On page 44 and other pages.
MISCELLANEOUS.—Assay Ton System of Weights, 34. Colliery Accident Relief Funds; Return Air in Mines; The Gold Fields of Venezuela; Mountains of Mica; Quartz Mining in Amador, 38. Gold Quartz Mining, 39. The Analysis of Furnace Gases, 40.

BUSINESS ANNOUNCEMENTS.

Machinery—Lane & Bodley Co., Cincinnati, Ohio.
Civil Engineer—Wm. Bredemeyer, Salt Lake City, Utah.

Passing Events.

Nothing momentous or especially noteworthy to be reported in the category of Passing Events this week. We are having a rather cool summer at the bay, and not over hot elsewhere on the coast. There is work for almost every class of laborers at fair wages in both city and country, the farmers in some localities complaining of a lack of harvest hands. The grain crop being gathered will about come up to the average, and the grape crop will be very abundant, which is more than can be said of most kinds of fruits and berries. The shortage in these, due to the hot, high winds of June, is being made manifest in the high prices ruling for these products, and in the somewhat restricted and much interrupted operations of the larger canneries, which find it impossible to procure enough material to keep their employes constantly busy. This works a great hardship to the many girls and poor women who, at this season of the year, rely upon these establishments for employment, and some of whom are able to put in not more than three or four days in the course of the week.

Many of the denizens of San Francisco have left the city, the most comfortable place of abode in the State or out of it, and gone off to enjoy the torments and harrassments of the springs and other summer resorts, or to swelter in the heat of the interior. They all have a royal good time, and are generally glad to get back. Meantime the inhabitants of the rural districts repair to the city to swelter in the fogs and get thoroughly cooled off in the frigid clime of San Francisco.

What the Report of the Director of the Mint Shows.

From advance sheets of the forthcoming report of H. C. Burchard, Director of the Mint, the mines in the United States appear to have produced during the year 1882 nearly two and a fourth million dollars less in gold, and over three and three-fourths millions more in silver than they did in 1881. The falling off in the product of gold was mainly due to the interference with hydraulic mining in this State by legal process, and the lessened output of the Bodie mines. The yield of gold in Idaho, however, decreased to the extent of $200,000, and of Dakota $700,000, Oregon showing also a diminished production. The opinion is expressed in this report by Mr. Burchard that the production of gold with us will follow that of other countries, and go on diminishing hereafter.

Canvassing the prospects of the future, we feel constrained to dissent from the opinion here expressed. It is true, there has been a great falling off from the quantity of gold formerly taken out in California; the declension during the last quarter of a century being even so great as Director Burchard states. But the product here has probably reached its minimum. Gold gathering during the first ten years of its existence in this State could hardly be called mining. It was little more than collecting the metal which nature had already mined for us and placed within easy reach. Being so accessible, and with so many hands in the field, the most of the crop was soon garnered. As regards the shallow placers, we are now merely gleaning the stubble, finding now and then a full sheaf hidden in some by-corner of the field, or overlooked in the rushing harvest. In the deep placers and the quartz veins lies our great and permanent wealth in this metal, and these stores we are now only just beginning to open up in anything like a systematic and efficient way. After a few years our annual production of gold will sensibly increase; then for a considerable time it will augment more rapidly, only in the remote future again undergoing a marked decline. As in California, so in most of our other mining States and Territories the yield of this metal will sooner or later experience some increment, to be kept up for an indefinite period, and then fall off again. Within another decade there will be some increased production of gold all round, though in all probability not so great relatively as that of silver.

The largest gain for the year in silver has occurred in New Mexico, amounting there to nearly two million dollars. The gain in Montana amounted to $1,700,000; in Idaho to $700,000, and in Utah to $400,000, while Arizona barely held its own.

The following table shows the total amount of gold and silver taken out in the several States and Territories named therein, and the production made of each of these metals:

States and Territories.	Gold.	Silver.	Total.
Alaska	$150,000	.....	$150,000
Arizona	1,065,000	$7,500,000	8,565,000
California	16,800,000	845,000	17,645,000
Colorado	3,360,000	16,500,000	19,860,000
Dakota	3,300,000	175,000	3,475,000
Georgia	250,000	.....	250,000
Idaho	1,500,000	2,000,000	3,500,000
Montana	2,550,000	4,370,000	6,920,000
Nevada	2,000,000	6,750,000	8,750,000
New Mexico	150,000	1,800,000	1,950,000
North Carolina	190,000	25,000	215,000
Oregon	830,000	35,000	865,000
South Carolina	25,000	.....	25,000
Utah	190,000	6,800,000	6,990,000
Virginia	15,000	.....	15,000
Washington Ter.	120,000	.....	120,000
Wyoming	5,000	.....	5,000
Totals	$32,500,000	$46,800,000	$79,300,000

The dividends made by incorporated companies in 1882 compared with those of 1881, show a slight falling off, being for the former year, as follows:

States and Territories.	Mines.	Amounts.
Arizona	5	$1,887,500
Colorado	16	2,326,650
California	10	1,312,047
Dakota	3	1,110,000
Montana	3	221,000
Nevada	7	683,262
Utah	4	2,129,000
Idaho	3	38,000
Georgia	1	48,000
New Mexico	2	204,000
Totals	54	$9,939,975

The above fails to show all the dividends realized during the year by incorporated companies, to say nothing of profits realized by incorporated companies and individual miners.

The number of persons engaged in mining during the year was, so far as reported, as follows:

Arizona	4,678
California	37,147
Colorado	28,970
Dakota	3,570
Idaho	4 708
Montana	4,813
Nevada	6,674
New Mexico	1,496
Oregon	3,696
South Carolina	114
Wyoming	328
Utah	2,592
Total	98,786

The number of men engaged in mining west of the one hundredth meridian is less than 100,000. The total product of bullion made averages nearly $1,000 per year for each man engaged in the business, besides large values realized from mining, coal, copper, lead, etc.

Improving on Further Acquaintance.

As some persons who disappoint us at first improve on further acquaintance, so are many of the mining districts on this coast which disappointed the pioneer prospectors, beginning to show, under more patient and skillful exploration, a much greater wealth than they were at first supposed to possess. Many localities that in the early day were passed by as unworthy of notice, and even some in which a good deal of work was done, but with results so little encouraging that they were afterwards abandoned or nearly so, have in these later times begun to attract capital and gather in population by reason of the much medium grade ore they contain and the promising indications shown. It is true, ores can now be worked with profit which were entirely worthless twenty years ago. Many and notable changes have during this period taken place in the business of mining, more especially in the departments of metallurgy and ore extraction. During these years our prospectors and miners have learned many things they required to know, and forgotten a few that they might better never have learned. They have discovered that Comstock and Eberhardt lodes are few and far between. They have learned that less than hundred dollar ore can be worked with profit, and forgotten, or at least partially forsaken their roving, unstable habits and stock gambling practices; besides some gains made in other forms of grace and other kinds of saving knowledge. Hence this rehabilitation of the once neglected and nearly deserted districts and this contentment to there abide and work for more moderate but surer returns. This ability to subsist at less cost and make living wages out of lower grade ores is equivalent to the discovery of new mineral regions and richer deposits in the olden time. So great is the extent of our known mineral domain and so abundant its resources that some improvement in the habits of our mining population and in our methods of mining is of more moment just now than the discovery of new metalliferous regions. Our prospectors have already run over too much territory making locations and doing little else. As a general thing they have too many claims with too little work done upon them. The miner who has stopped in one place and proved his lodes is apt to have something to show for his labor, whereas the persistent prospector has generally very little.

Among other of these partially resuscitated districts is the locality known as American Flat, two miles south of Virginia city, and through which it was at one time confidently believed the great Comstock lode was continued in that direction, and in the effort to discover which, millions of dollars were expended in the early day. Proving ineffectual, labor on American Flat was at last nearly suspended, very little having been done there for the past ten or twelve years. Recently some very rich ore has been struck there by parties working the mines on tribute, and the old camp, with its dilapidated mills and hoisting works, its abandoned shafts and tunnels, its empty houses and generally woe-begone appearance, exhibits signs of new life, and it would not be strange if something of its ancient importance were in course of time restored to it. From Pioche and other points in eastern Nevada, from Lida valley in the southern part of the State, and from divers camps in southeastern California, come like notes of a general revival in districts where for years past little or nothing had been done. This awakening is creditable to the good sense and pluck of our miners, and augurs well for the future of the business. We shall watch with interest and make a note of all other examples of this kind brought home to our knowledge.

The Analysis of Furnace Gases.

Read at the Boston meeting of the American Institute of Mining Engineers, February, 1883, by Magnus Troilius, chemist to the Midvale Steel Company, Philadelphia.

For some time I have been using with great advantage, for the purpose of determining rapidly and accurately the chemical composition of gases from Siemens' producers, an apparatus arranged generally like that proposed by Prof. Eggertz; * and I now take pleasure in laying before the members of the Institute a description of the apparatus and its use, hoping that some of them may find it of practical advantage.

At the end of the paper are given some results obtained and heat calculations, with the necessary data for the same.

Collection of Gases.

Fig. 1 shows the arrangement for taking a sample of gas. The funnel, F, which may be made of tin plate, is made to fit the test-hole. The gas passes up through the funnel and through the rubber tubing with the glass tube, K, filled with asbestos for retaining dust, and is drawn into the upper flask by means of water flowing from the same into the lower flask. The upper flask must be *completely* filled with water from the beginning, so that no air remains. When filled with gas the screw-compressors are securely fastened on, and the flask disconnected from the funnel and receiver. Quart flasks, with openings at the bottom, are very suitable and easily obtainable.

Composition of the Gases.

The ingredients found in producer gases are: Carbonic acid (CO_2), oxygen (O), ethylene (C_2H_4), carbonic oxide, (C. O), hydrogen (H), and marsh gas (CH_4). The nitrogen is taken by difference. CO_2 O, C_2H_4, CO are determined by absorption in various liquids and by observing the resulting diminution of volume. H and CH_4 are determined by combustion with oxygen.

Carbonic Acid.—For this gas is used a solution of 16 grams of potassium hydrate in 100 c. c. of water; 4 or 5 c. c. of this solution absorb 100 c. c. of CO_2.

Oxygen.—Twenty grams of pyrogallic acid are dissolved in 100 c. c. of air-free water. For use, this is mixed with an equal volume of the above potassium hydrate solution. Four c. c. of the mixture absorb the oxygen from 100 c. c. of air. It should be kept in a dark bottle.

Ethylene (C_2H_4).—A little bromine vapor effects the complete absorption of this gas.

Carbonic Oxide.—Dissolve 15 grams of suboxide of copper (Cu_2O) in 100 c. c. of hydrochloric acid (l. 19 sp. gr.), at 70° or 80° C. under a thin layer of paraffine. Keep metallic copper in the solution and use a dark bottle.

Hydrogen and Marsh Gas (CH_4). Fig 2 shows the combustion tube through which the mixture of these gases is passed. It is of platinum, with .5 mm. internal and 2 mm. external diameter. At the ends it is provided with cylinders of German silver for attaching rubber tubing. Mr. J. Bishop, of Sugartown, Chester county, Pa., supplies good tubes of this kind.

As seen from the sketch the tube is bent into a double coil, and in use it is held in a slanting position, the smaller coil only being heated to redness during the operation. Very rapid combustion takes place in this way. The bore of the tube should not be above .5 mm., otherwise explosions can occur.

Complete Analysis.

Fig. 3 shows the apparatus for complete gas analysis. The gas burette, B, is graduated to 100 c. c. capacity. It is connected with the funnel at the top, by means of a three-way stopcock, which can be turned so as to communicate with either the funnel or the pipette, P, of 200 c. c. capacity. Between the pipette and the burette the combustion tube is suspended. A screw compressor is applied between the combustion tube and the three-way stopcock; this compressor is used, during the combustion, as the chief regulator of speed for the gas mixture, passing from B to P and returning to B. The flasks F and F' can be raised or lowered by means of the stands S and S', with movable shelves or brackets, as shown.

At the lower end of the burette an ordinary glass stopcock is placed; a three-way stopcock would, however, also work very well here, as it is necessary, during the operation, to connect alternately with a suction pump and the flask, F. Before reading off the volume, the gas is compressed a few centimeters by raising the flask, F, and letting it bubble up through a little water in the funnel. In this way the gas is made to assume the same pressure as the air. The volume may now be taken, either by holding F so that the water therein is on the same level as the water in the burette, or simply by letting in water from a funnel as long as it will run. I prefer the former mode. The cylinder, C, is filled with water and holds a centigrade thermometer. The temperature can thus be observed and kept constant during the entire analysis. This is of importance in accurate work, as the gas expands according to the formula $v(1+.004t°)$, or about .4 c. c. for every degree centigrade.

To start an analysis, draw out a few cubic centimeters of water by means of the suction pump, taking care to have the screw compressor at the top well closed, and the funnel shut off, when the lower stop-cock is open. Let a few cubic centimeters of the potas-

* Jernkontorets Annaler, 1882.

sium hydrate solution flow into the burette from the funnel. Almost all the carbonic acid is taken up when the alkaline liquid flows down slowly along the sides of the burette. It is well, however, to take out the burette from the holder, and move it so as to let the liquid flow slowly backwards and forwards. The potassium hydrate is then carefully washed out by repeatedly drawing off the liquid from the bottom of the burette by means of the suction-pump, and letting pure water flow in from the top of burette; the remaining volume of gas is then read off. The other gases are then taken in the same way, by introducing the proper ab-

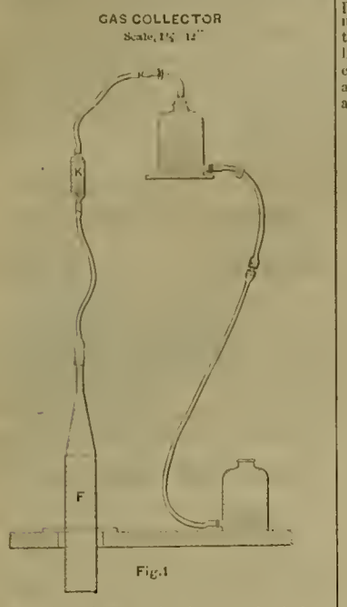

Fig.1

sorbent, observing that in the case of ethylene no shaking of the burette is required, as the bromine vapors fill the burette.

Each reagent must be carefully washed out before introducing another, and they must be used in the order described—namely, potassium hydrate for carbonic acid, pyrogallic acid for oxygen, bromine for ethylene, subchloride of copper for carbonic oxide. A little hydrochloric acid must be added to the first water used for washing out the last named reagent, as otherwise a white precipitate of basic copper chloride will come down.

Potassium hydrate would expel carbonic oxide from its solution in subchloride of copper. Both hydrochloric acid and bromine give a tension to the gas, but this is obviated by careful washing before reading off. More shaking is required to effect the absorption of the carbonic oxide than in the case of the other gases.

The absorbing influence of water does not practically interfere with the results if the gas is analyzed soon after taking the sample. If the gas be allowed to stand in contact with water for any length of time, the carbonic acid will be partly or wholly absorbed, while the

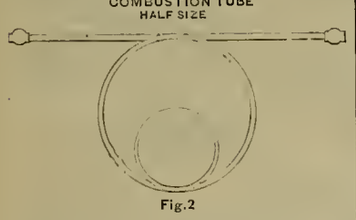

Fig.2

other gases suffer but very slight diminution in volume.

After removing the carbonic acid, oxygen, ethylene and carbonic oxide, as above described, about 20 c.c. of pure oxygen are taken into the pipette P. This is an ample quantity for determining by combustion the amounts of hydrogen and marsh gas, usually contained in about 100 c.c. of producer-gases. As a safeguard against explosions, the rule may be observed that the sum of the volumes of the gases taking part in the combustion must not exceed one-half of the total volume of the gases in the burette.

To mix the gases in the burette with oxygen, the flasks F and F' are raised and lowered alternately, and the speed of flow of gas regulated by means of the screw-compressor at the top of burette. When thus mixed, the volume of the gas mixture is read off and the combustion-tube gently heated while the gas is passed at the rate of about 10 c.c. per minute from B to P. The smaller platinum coil is then heated to full redness, and the gases are drawn back from P to B. Complete combustion of hydrogen and marsh gases then takes place in the tube; vapor of water, which condenses, and carbonic acid are formed; one volume of hydrogen giving one volume of water and one volume of marsh gas, giving one volume of carbonic acid and two volumes of water.

The actual number of cubic centimeters representing the free hydrogen in the original gas volume, is consequently obtained from the formula:

$$\frac{2}{3}\,[M - 2c.]$$

M being the total diminution of volume after combustion, and c the volume of the carbonic acid from the marsh gas. This carbonic acid is, of course, determined as previously described. It gives the volume of the marsh gas direct.

Fig. 4 shows a simpler burette without glass stopcocks, chiefly intended for the determination of carbonic acid, oxygen and carbonic oxide only. By inserting a T tube between the funnel and burette, a more extended use may be had of this very simple and convenient apparatus. In this case, however, bromine can not be used for the ethylene, as it would attack the rubber-tubing. Sulphuric acid, in a special burette, and before using the other reagents, could be used instead. Producer-gases do not, as a rule, however, contain any considerable amounts of marsh gas or oxygen, and for prac-

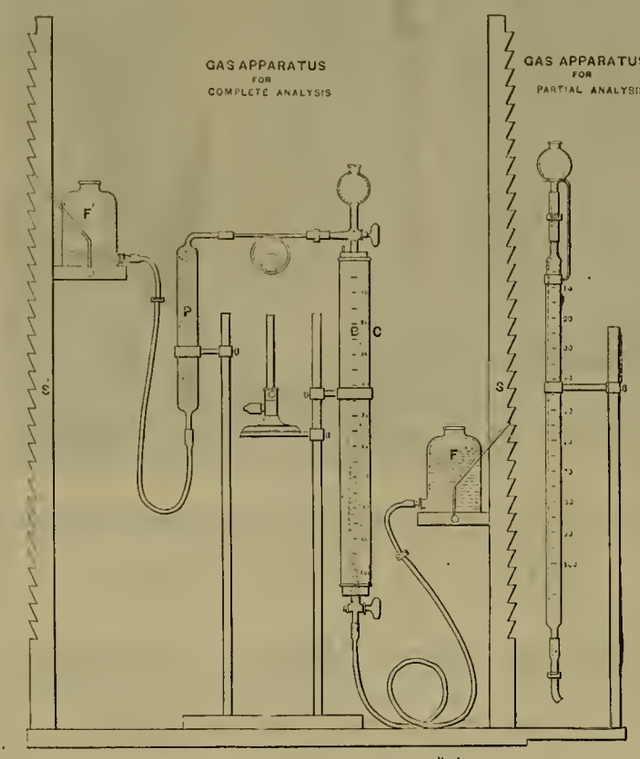

Fig.3 Scale, 6" 1' Fig.4

tical purposes these gases may be left out of the analyses altogether.

Analyses and Calculations of Heat

In a special table below are given the results of eight analyses of producer-gases by the method described. The first six samples were taken from the blast-producers of Messrs. Hoopes & Townsend, of Philadelphia. These producers were designed by their mechanical engineer, Mr. Ferdinand Philips. Sample No. 1 was taken from a producer into which the blast was forced by means of a fan. In all the other cases the blast was forced in by means of steam-injectors. Anthracite coal was used in all the producers.

The last two analyses in the table were taken from the Siemens' draft-producers for the open hearth plant at the Midvale Steel Works, using soft coal.

To find the total amount of heat-units that can be developed by the complete combustion of 100 liters of one of the gases at 0° C, and 760 mm. pressure, one has only to multiply the CO, C_2H_4, H and C_2H_4, as found from the table, by the number of heat units belonging to each of these gases per one liter at 0° C at 760 mm. pressure. These numbers are, according to Bunsen:

For hydrogen, 3088 (burned to H_2O, which condenses).
For carbonic oxide, 3007.
For marsh gas, 8482.
For ethylene, 13982.

One volume of hydrogen requires for combustion to one volume of water, one half its volume of oxygen (2½ vol. of air).

One volume of carbonic oxide requires for its combustion to one volume of carbonic acid, one half its volume of oxygen (2½ vol. of air).

One volume of marsh gas requires two volumes oxygen (10 vol. of air) for its combustion, to one volume of carbonic acid and two volumes of water.

One volume of ethylene requires for its combustion to two volumes of carbonic acid and two volumes of water, three volumes of oxygen (15 vol. of air).

These four combustions are chemically expressed thus:

Hydrogen:

2H	+	O	=	H_2O.
2 vol.		1 vol.		2 vol.

Carbonic Oxide:

CO	+	O	=	CO_2.
2 vol.		1 vol.		2 vol.

Marsh Gas:

CH_4	+	4O	=	CO_2	+	$2H_2O$.
2 vol.		4 vol.		2 vol.		4 vol.

Ethylene:

C_2H_4	+	6O	=	$2CO_2$	+	$2H_2O$.
2 vol.		6 vol.		4 vol.		4 vol.

The latent heat of vapor of water per liter is (Buusen) 514 heat units. The specific heat, per liter, at 0° and 760 mm. pressure of nitrogen, carbonic acid, and vapor of water are (Bunsen):

For nitrogen	— .307
For carbonic acid	— .425
For vapor of water	— .382

By aid of these data the theoretical or flame temperatures of the gases are calculated. In these calculations it is supposed that the gas is completely consumed with the least possible amount of air, and that the heat is entirely taken up by the products of combustion, viz.: carbonic acid, vapor of water, and the nitrogen, which was partly present in the gas before combustion, and partly carried along with the air for combustion.

The calculation of the flame temperature is best illustrated by an example. Take, for instance, gas No. 10 (vide table). We have:

$$93966 = [(3.9 + 27.3 + 1.4) .425 + (67.4 + 54.6 + 11.2) .307] T + 514 \times 2.8 + (T - 100) 2.8 \times .382.$$

This equation may be transformed thus:

$$93966 - (476 \cdot 2.8) = [(3.9 + 27.3 + 1.4) .425 + (67.4 + 54.6 + 11.2) .307 + 2.8 \times .382] T \therefore T = 16540 \text{ C.}$$

This latter equation gives a good general rule for calculating the flame temperature of a gas as follows:

Put the number of calories per 100 liters, minus 476 times the volume of the water formed by combustion of 100 liters, equal to the temperature sought, multiplied by an expression consisting of a sum obtained by multiplying the CO_2, H_2O, and N with their respective specific heats per liter and adding the products together.

Iron and Civilization.

It is quite common among political economists, says the *Iron Age*, to measure the advancement of a nation toward the plane of a high civilization by its consumption of such products as indicate the nearest approach to the perfect development of mechanical skill, or the wide-spread existence of diversified industry. There is no doubt that the most civilized nations use the highest quarterly per capita of every useful product. Such nations not only provide themselves with food in great plenteousness and variety, but they also clothe themselves and furnish their homes with care and taste, provide the best facilities for transportation, and the machinery best calculated for perfect work, by which all their needs and luxuries are supplied. Wool and iron are perhaps the two largest and most important factors by which a nation's superiority may be thus measured, and are each referred to as furnishing tests for comparing the relative advancement in the arts and sciences and in the social condition of different peoples.

It will be interesting in this connection to notice the actual consumption of the principal factor, iron, by several of the leading nations of the earth. It will be observed that the United States heads the list, followed, at quite a distance, however, by Great Britain, France, Germany, etc:

COUNTRIES.	Tons.
United States	6,065,019
Great Britain	4,618,932
France	2,508,706
Germany	2,488,967
Russia	965,000
Austria	625,000
Belgium	587,000
Italy	280,000
Holland	257,963
Spain	205,494
Sweden	190,000
Brazil	75,756
Turkey	65,000
Portugal	58,000
Mexico	48,821

As Americans, we have no fault to find with the showing, even though a per capita calculation be entered into to reach, by the aforementioned sale, the relative degree of civilization between ourselves and our sister nations. In the *production* of the raw material, however, the showing is not so flattering; and it is all the more suggestive, from the fact that no nation on the globe excels our own in the natural facilities for producing this most essential of all the products of industry.

It appears from the statistics of the various countries that three parts of the whole quantity of pig iron are produced in England, America and Germany, the remainder being contributed by France, Belgium, Austria, Russia, Swedeu, Spain, Turkey, Italy, Australia, Japan, Switzerland, Canada, Mexico, and, in very small proportions, a few other countries. In 1882, the production of pig iron in England rose to 8,493,287 tons; in America, to 4,623,323 tons; and in Germany, including Luxemburg, to 3,170,000 tons. The production last year of these three countries was consequently 16,286,610 tons, while that of the whole world amounted to 21,000,000 tons. Great Britain has, therefore, contributed about 40 per cent of this quantity, the United States about 22 per cent, and Germany about 15 per cent; moreover, the American out-turn equaled 54 per cent of the German, and 37 per cent of the English,

COPP'S U. S. MINERAL LANDS,

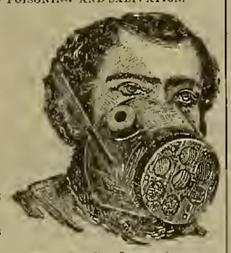
Laws, Forms, Instructions and Decisions.

Has no surplus verbiage. Contains Dr. Raymond's Glossary. Explains how to examine mining titles. Contains numerous court decisions. Gives the Public Land Commissions Codification, and gives many and d improved forms. Price—Full law binding, extra paper, $6.00.

For Sale by DEWEY & CO., San Francisco.

San Francisco Cordage Factory.

Established 1856.



Constantly on hand a full assortment of Manila Rope, Sisa Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice

TUBBS & CO.,
611 and 613 Front Street, San Francisco

Patent Life-Saving Respirator.

PREVENTS LEAD POISONING AND SALIVATION.

Invaluable to those engaged in dry crushing quartz mills, quicksilver mines, white lead corroding, feeding thrashing machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and, if not satisfactory, the price will be refunded. Price, $3 each, or $30 per dozen. Address all communications and orders to

H. H. BROMLEY, Sole Agent,
43 Sacramento Street, San Francisco, Cal.

FOR SALE

By J. M. LAKENAN, of Grass Valley Foundry, Grass Valley, Cal.

One 20-inch bore engine, 24-inch stroke; one 18-inch bore engine, 40-inch stroke, Meyer's cut-off; one 14-inch bore engine, 36-inch stroke, Meyer's cut-off; two 12-inch bore engines, 36-inch stroke; two sets heavy pumping gear, with bob and connecting rod irons, etc.; 450 feet of 10-inch pump pipe of ½-inch iron, heavy flanges; besides other mining and milling machinery.

For information, address

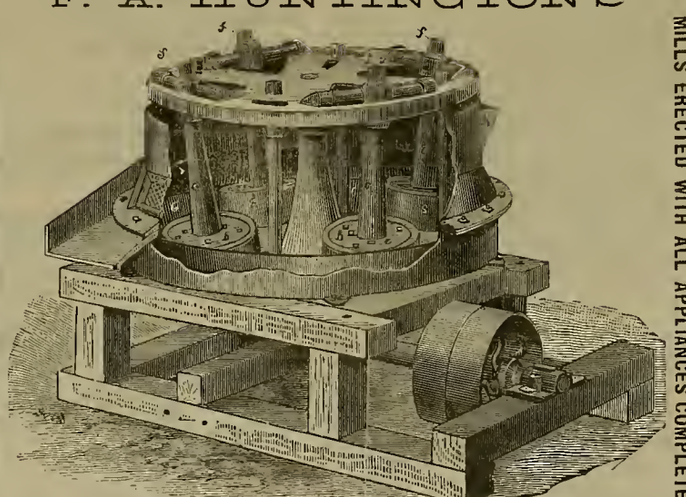
MILL & MINING MACHINERY.

F. A. HUNTINGTON,

No. 45 Fremont Street. - - San Francisco, Cal.

PATTEN'S



CONCENTRATOR

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

F. A. HUNTINGTON'S

CAPACITY AND DURABILITY GUARANTEED.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

CENTRIFUGAL ROLLER QUARTZ MILL!

After running one of these mills on the Whidden mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

F. A. HUNTINGTON, ESQ.—DEAR SIR: Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Company's property, at Shingle Springs, El Dorado county, Cal., about four months, and it did good and satisfactory work; a greater portion of gold remaining in the mill than in a stamp battery.

FRED. JONES, Supt.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

This paper is printed with Ink Manufactured by Charles Enu Johnson & Co., 5 and South 10th St., Philadelphia. Branch Offices—47 Ross St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorsty, 529 Commercial St. S. F.

LAND Good land that will raise a crop every year. Over 12,000 acres for sale in lots to suit. Very desirable Fruit, Vine, Grain, Vegetable, Hay, and Pasture land. Near Railroad and Sacramento river; $3 to $30 per acre. Wood and water convenient. U. S. Title perfect. Send stamp for illustrated circular, to EDWARD FRISBIE, Proprietor of Reading Ranch, Anderson, Shasta Co., Cal.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F

FOR WEEK ENDING JULY 10, 1883.

281,004.—ROTARY ENGINE—J. J. Blair, Tacoma, W. T.

281,027.—VENTILATION—W. T. Cottier, Napa, Cal.

281,037.—STEAM BOILER—P. F. Dundon, S. F.

280,821.—ROLLER SKATE—W. B. Higgins, S. F.

280,929.—FULLING MILL—R. H. H. Hunt, S. F.

281,084.—SOLAR FRUIT DRIER—W. P. Kirkland, S. F.

280,834.—LIFT PUMP—H. C. Langrehr, S. F.

280,835.—COMPOUND PUMP—H. C. Langrehr, S. F.

281,087.—ENDLESS CHAIN CARRIER FOR COAL—Lesourd & Lotan, Portland, Or.

281,090.—REFRIGERATING AND ICE MACHINE—Hugh Logan, S. F.

280,845.—SCREWDRIVER—A. McLellan, Portland, Or.

281,100.—HEAD-BLOCK GEAR FOR SAWMILLS—M. C. Meeker, Occidental, Cal.

281,114.—INHALER—S. A. Morse, S. F.

280,882.—TREATING ALCOHOLIC LIQUORS WITH ELECTRICITY—A. C. Tichenor, Alameda, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

AN IMPROVED BOOT.—Thos. H. Buckingham, of San Francisco, Cal., assignor to Buckingham & Hecht, of same city. No. 280,443. Dated July 3, 1883. This invention relates to a certain new and useful improvement in boots, consisting in the fashioning of certain parts and their combination so as to form the upper and leg of the boot. The object of the invention is economy in cutting and simplicity in construction, combined with strength and comfort. It is difficult to describe this invention without diagrams or illustrations. Suffice to say that in a boot made after this patent there is no side seam, either on the leg, or at the line where the counter joins the main piece. The latter seam is well known to be the first to give out, and its avoidance is a benefit, both because of this fact and also because of the greater comfort which it gives the wearer.

EXTENSION LADDER AND TRUCK.—Daniel W. Hoover, of Gas Point, Cal. No. 280,475. Dated July 3, 1883. This invention relates to a new and useful extension ladder and truck, the particular object of which is to provide a ready means for picking fruit, for pruning trees, or for any such or similar use. Its portability renders it peculiarly adapted to such work. The extension portion of the ladder is connected with the main portion by means of hinges, placed on the front sides, whereby such extension may turn or fold down forward, but is limited in its upward movement by finding a bearing for its sides on the sides of the main portion of the ladder, in which position it continues the inclination of the main portion. The extension is properly secured by brace bolts, etc., so that a person can mount the extension with perfect safety.

GUN SIGHT.—John C. Kelton, S. F., Cal. No. 280,484. Dated July 3, 1883. This invention relates to certain improvements in the rear sight of rifles generally, but is more particularly adapted for use upon the United States Springfield rifle and carbine, as at present constructed, although it may also be used on other rifles. The object of the invention is to enable the sight to be more quickly and correctly adjusted, and also to provide a better lateral adjustment to counteract the deflection caused by the wind. The invention consists of a base which is fixed to the barrel of the gun, a hinged leaf having side bars which fall outside the base, and a slide which has a movement only in the direction of the length of the bars. This slide carries the sight proper. The sight itself is, in form, the segment of a cylinder, with the notch extending around the curve centrally, so that its depth will be the same at all elevations.

FEED CUP.—Edward J. Thomas, of Oakland, Cal. No. 280,532. Dated July 3, 1883. This invention relates to an improved feed-cup for bird cages, the object of which is to prevent the bird from scattering the seed or other contents of the cup upon the floor of the cage or elsewhere. This object is accomplished by the intervention of a lip or flange placed in the throat of the cup, whereby the seed is guarded from being thrown out in front, while the bird is at the same time prevented from throwing the seed out with his bill.

SAFETY ATTACHMENT FOR RAILWAY TRAINS.—Samuel Brown, S. F., Cal. No. 280,442. This invention relates to a new and useful safety attachment for the cars and locomotive of a railway train, and consists of a peculiar clamp or guard, rigidly secured under the cars, and in a raised bar or rail, with which the clamp or guard is adapted to engage. The object of the invention is to prevent the derailment of a railroad train at sharp curves, or at other dangerous points, where, under speed, the wheels may have a tendency to leave the track.

SEED SOWER ATTACHMENT.—William T. Armstrong, of Soledad, Cal., assignor to Baker & Hamilton, of San Francisco. No. 280,437. Dated July 3, 1883. This invention relates to an attachment for seed sowers, and is especially applicable to that class of implements in which the grain flows through an opening in the bottom of a containing hopper, and is spread by a horizontally rotating disk with distributing arms. It consists of one or more spirally curved arms, which are fixed to the top of a shaft which projects up through the opening in the bottom of the hopper, and which, by their peculiar shape and action, force the grain down in a regular current, which ensures its being sown evenly upon the ground.

INHALER.—Stephen A. Morse, San Francisco, Cal. No. 281,114. Dated July 10, 1883. In the usual articles of this class great care must be taken to avoid blowing through the mouth tube, as this forces the liquid in the bottle up into the acid chamber and destroys the arrangement and effect of the ingredients. Mr. Morse overcame this difficulty by the use of a neat and effective valve which prevents the liquid from rising into the acid chamber when the tube is blown into, but allows the perfect effect of inhalation.

MASONIC EMBLEM.—David W. Laird, of S. F. No. 14,025. This is a new and original design for a Masonic emblem or jewel, consisting of a Maltese cross, in the central portion of which is a shield bearing the coat of arms of the State of California. Upon the outer edge of the arms of the cross any suitable words may be engraven. The cross is suspended by a link from a bar which supports the figure of a grizzly bear. The design is both beautiful and appropriate.

News in Brief.

THE Canadian hop crop promises to be very poor.

JAMES ROBINSON committed suicide at Salt Lake.

THE yellow fever is raging at Callao and Lima.

A STRANGE and fatal horse disease has broken out in Utah.

A GERMAN paper will be established in the city of Mexico.

THERE are 300 bridges on the line of the Utah & Northern railroad.

THE relations between Prussia and the Vatican are still strained.

THE President of Chili advises the separation of Church and State.

MRS. NANCY ADAIR dislocated her neck and fell dead while addressing a prayer meeting in the Cherokee nation.

ALONG the line of the Mexican Central railroad there are twenty-one cities, with an aggregate population of 896,000, and none of them are State capitals.

A CHINAMAN caught a sturgeon weighing 100 pounds, in Feather river, below Oroville, last week. The fish pulled him overboard, but he was rescued by his comrades.

A SQUAW was killed by her buck in Butte valley, White Pine county, Nev., a few days ago, and her murderer was hitched to a horse by members of the tribe and "snaked" to death.

ARE you troubled with such symptoms of dyspepsia as belching, tasting of the food, heart-burn, etc.? Brown's Iron Bitters will cure you.

Seigler Springs.

These Springs are situated about seven miles from Lower Lake, Lake county, and are reached in twelve hours from San Francisco, via Calistoga. The Springs include soda, iron, magnesia, sulphur, arsenic, etc., and have been well tested for a variety of diseases, and their curative properties recommend them to the afflicted. Situated in a beautiful and healthy location, the number of visitors to the place has been steadily increasing, and a fine large hotel has been erected this summer to meet the requirements of increasing patronage. A large swimming bath is one of the attractions of the place, and Mr. F. J. McCullough, the proprietor, spares no pains to accommodate those who pay the Springs a visit. The table is supplied with the best articles obtainable. Those contemplating visiting the springs, either for health or pleasure, will do well in giving Seigler Springs a visit.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

SEEK

health and avoid sickness. Instead of feeling tired and worn out, instead of aches and pains, wouldn't you rather feel fresh and strong?

You can continue feeling miserable and good for nothing, and no one but yourself can find fault, but if you are tired of that kind of life, you can change it if you choose.

How? By getting one bottle of BROWN' IRON BITTERS, and taking it regularly according to directions.

Mansfield, Ohio, Nov. 26, 1881.
Gentlemen:—I have suffered with pain in my side and back, and great soreness on my breast, with shooting pains all through my body, attended with great weakness, depression of spirits, and loss of appetite. I have taken several different medicines, and was treated by prominent physicians for my liver, kidneys, and spleen, but I got no relief. I thought I would try Brown's Iron Bitters; I have now taken one bottle and a half and am about well—pain in side and back all gone—soreness all out of my breast, and I have a good appetite, and am gaining in strength and flesh. It can justly be called the *king of medicines*.
JOHN K. ALLENDER.

BROWN'S IRON BITTERS is composed of Iron in soluble form; Cinchona the great tonic, together with other standard remedies, making a remarkable non-alcoholic tonic, which will cure Dyspepsia, Indigestion, Malaria, Weakness, and relieve all Lung and Kidney diseases.

The Home School for Young Ladies
OAKLAND, CAL.

The Home School, which has hitherto been under the management of Miss H. N. Field, now deceased, will be re-opened on the 25th inst. under the personal supervision and care of Miss Lucy A. Field and Miss Caroline H. Field, her sisters. The Misses Field, who now assume control, were formerly connected with this school for four years ending September, 1877, and have also had large experience as teachers of young ladies in the East. They assure its former friends and patrons and the public, that no effort or expense will be spared to maintain the high reputation which this school has attained. The best teachers in all branches will be provided, and every care and attention bestowed upon the physical, mental and moral welfare of those committed to their charge. Terms for boarders and day pupils as heretofore. Further information may be had by letter or personal application at the school, 1825 Telegraph avenue, Oakland, Cal.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending June 30, 1883, the Board of Directors of the GERMAN SAVINGS AND LOAN SOCIETY has declared a dividend on Term Deposits at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum, and on Ordinary Deposits at the rate of three and six-tenths (3 6-10) per cent per annum, free from Federal Taxes, and payable on and after the 2d day of July, 1883. By order,

GEO. LETTE, Secretary.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Mining Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Seaton Gold Mining Company.—Location

of principal place of business, San Francisco, California. Location of works, Drytown, Amador county, California.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment No. 2, levied April 10, 1883, the several amounts set opposite the names of the respective shareholders, as follows:

Gould and Curry Silver Mining Company.

ASSESSMENT No. 45.

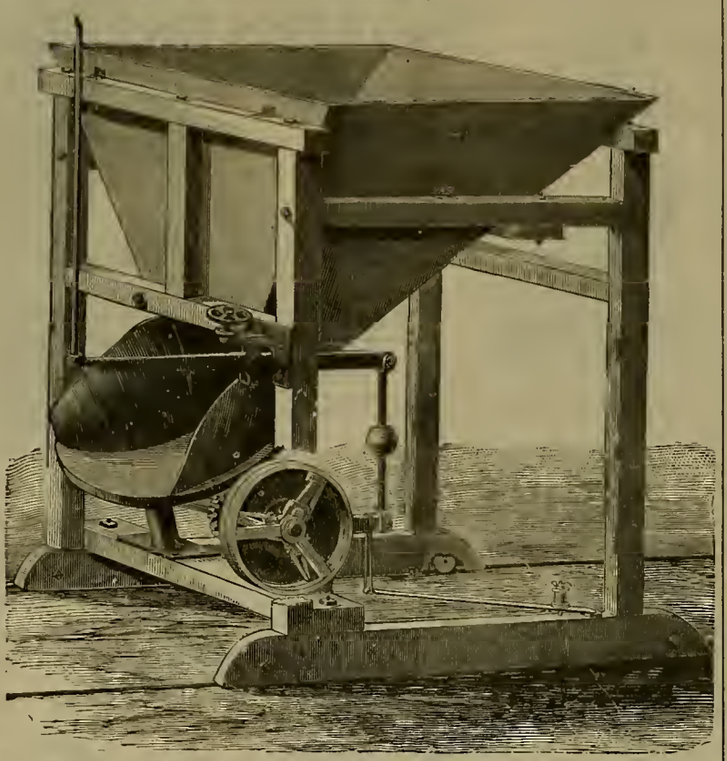
Levied ..... June 15, 1883
Delinquent ..... July 20, 1883
Day of Sale ..... August 13, 1883
Amount ..... Fifty cents per share.

ALFRED K. DURBROW, Secretary.

OFFICE—Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $8. These volumes, complete, are scarce, and valuable for future reference and library use.

"Challenge" Ore Feeders.



OVER 1100 HAVE BEEN IN SUCCESSFUL OPERATION.

Awarded First Premiums at the Preceding and last Industrial Fairs of the Mechanics' Institute of San Francisco.

TWENTY PER CENT. MORE ORE CRUSHED WITH FIFTEEN PER CENT. LESS WEAR OF IRON THAN BY THE OLD METHOD OF HAND-FEEDING.

The opposite cut illustrates the recently-introduced Grip and Spring Attachment, which replaces the Weight originally used and result in an obvious improvement.

The practical operation of the large number of these machines now in use demonstrates the fact that the principle upon which a perfect Ore Feeder must be constructed is that of a *carrier* and not that of a shaking table. Uniform feeding is not possible upon the latter plan. The ore must be *evenly carried* upon a steadily advancing plane or table to the flue or point of discharge, and there be simply dropped. Jerky or spasmodically acting contrivances will not answer the purpose for feeding wet or sticky ores, nor for the ores of mines where they may change from sharp quartz to an intermixed material of quartz and earthy matter.

The e Feeders are in Successful Practical Operation in the following Quartz Mills, and are giving Perfect Satisfaction to their Managers.

Compromise	10 Stamps	Mariposa county, Cal.

And in many other Mills in the Mining Districts of the entire United States, and as well in Nova Scotia and Australasia. The superiority of these Feeders over others manufactured has been so thoroughly demonstrated that it is not deemed pertinent to cite the numberless instances of this fact.

Manufactured and for Sale by

THE "JOSHUA HENDY MACHINE WORKS,"

Nos. 49 and 51 Fremont Street, San Francisco, Cal.,

Manufacturers of Quartz, Saw Mill and General Machinery. Agents for "BAKER" ROTARY PRESSURE BLOWERS, WILBRAHAM ROTARY PISTON PUMPS, P. BLAISDELL & CO.'S MACHINISTS' TOOLS, and the Celebrated "HOT POLISHED SHAFTING," from the Akron Iron Company, Akron, Ohio. Also Manufacturers of New and Dealers in Second-Hand Boilers, Engines and all Descriptions of Machinery.

CATALOGUE AND PARTICULARS FURNISHED UPON APPLICATION.

MINING MACHINERY

INCLUDING

Steel Water Jacket Smelting Furnace,

Quartz Mills, Concentration Works, Hoisting Apparatus, and all classes of Machinery employed in Mining and Reduction of Ores.

PORTABLE AND STATIONARY

STEAM ENGINES

From Ten to Two Hundred Horse Power, Steam Boilers of any Style and Capacity.

SAW MILLS

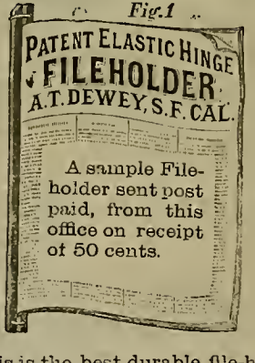
Adapted to wants of the Planter, Miner, or for the manufacture of Merchant Lumber, Prices ranging from

$200

Upwards, and of Capacity from 2,000 to 50,000 Feet per day. Shafting, Hangers, Pulleys, Gearing, and all Appliances for the Transmission of Power.

LANE & BODLEY CO., Cincinnati,

DEWEY & CO.'S



Scientific Press  Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG.

This is the best durable file-holder in use. Send for sample, or further information, to this office.

UNITED STATES

Submarine Monitor COMPANY,

230 Montgomery Street, Room 20, SAN FRANCISCO.

WM. H. MILLIKEN, Engineer.

Plans are on exhibition and stock ready for issue. Any information that is desired can be furnished at the office as above.

DON'T FORGET THE STAMP.—Always take a last look at a letter before posting to see that the stamp is in place. Recently one of our agents in Los Angeles county found a letter containing $3 for one year's subscription to our paper, held for postage which the writer no doubt thought he had duly stamped, and but for the incidental finding of it by our agent, would of course have supposed we had received the money at the proper time. Let all subscribers when remitting or ordering their paper stopped be sure they duly stamp their letters.

Educational.

St. Augustine College,

BENICIA, CAL.

Thirty-first Term Opens

TUESDAY ..... JULY 31, 1883,

At 2 o'clock.

RT. REV. J. H. D. WINGFIELD, D. D., LL. D., President.

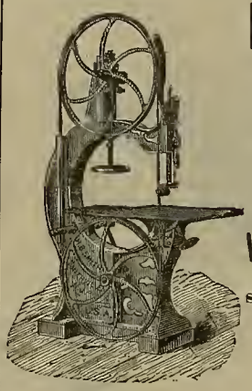
Cheap Ore Pulverizer.



There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

COKE. PATENT. COKE.

This COKE is exclusively used by Prof. Thomas Price, in his assay office, by the Selby Smelting and Lead Co., Prescott, Scott & Co., Risdon Iron and Locomotive Works and others in this city. Large supplies are regularly forwarded to consumers in Salt Lake and Nevada, to the Copper Queen Mining Co., Longfellow Copper Mining Co. and other consumers in Arizona.

The undersigned are in receipt of regular supplies from Cardiff, Wales, and offer the COKE for sale in quantities to suit purchasers.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

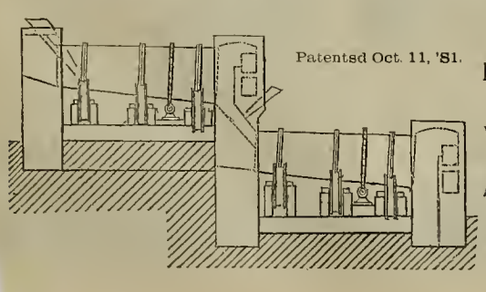
EXCELSIOR BLASTING POWDER,

Manufactured by the



EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro Glycerine Powder, as safe to use and handle as any other Nitro-Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

VOLUME XLVII Number 4.

Treating Gold-Bearing Clays.

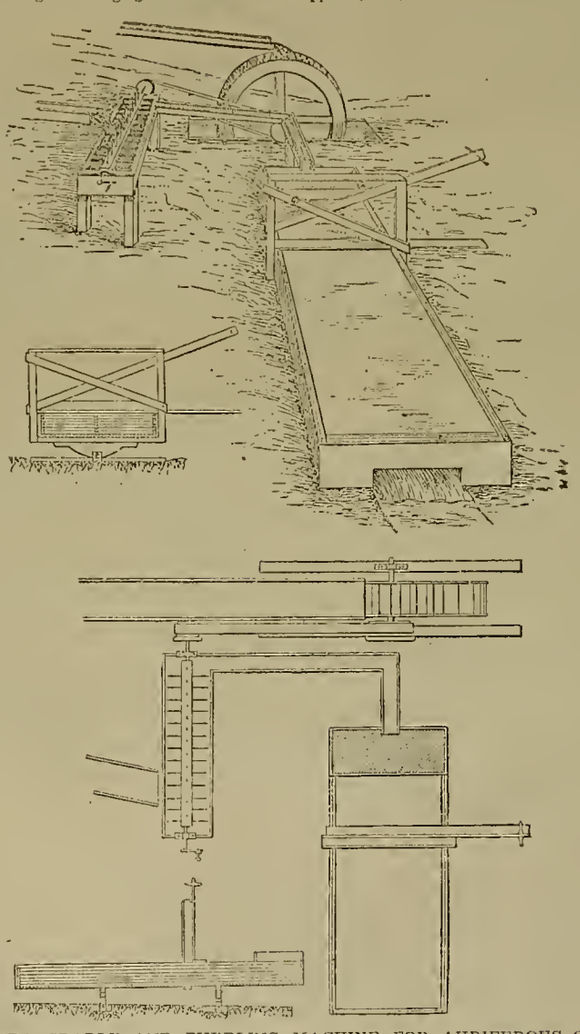
In alluvial formations auriferous, but tenacious clay is often found. Special implements have, therefore, been devised for treating such gold-bearing clays, and these are known as puddling machines. The original and most simple form is the puddling box, a rough wooden box about six feet square and eighteen inches deep; or even half a large barrel is commonly used, where operations are conducted on a small scale. Into this the clay is thrown, and supplied with plenty of water. The mixture is then stirred constantly with a shovel, prong or rake, till the clay is thoroughly disintegrated and suspended in the water, when a plug, inserted near the bottom of the tub, is withdrawn, and the thin mud, or rather muddy water, is allowed to escape. A fresh supply of clay and water is now admitted, and the stirring process is repeated; this continues until the box has become filled with gravel, sand, etc., to the level of the plug hole, when operations are suspended, and the deposit containing the gold, if there was any in the material treated, is taken out and washed up in a cradle or pan. Where operations are more extended, an upright shaft, furnished with strong arms, is placed in the center of the tub, and set in motion by a miter wheel, driven by horse or steam power. In this State puddling is seldom resorted to, though it is occasionally. In Australia, on the other hand, water is not so plentiful, and there the puddling machine is in common use. It consists of a circular space, whose sides and bottom are lined with hard wood or iron, and in the center of which revolves a perpendicular shaft worked by horse power. From the cross beam on this shaft depend two harrows, which are dragged round the circle, and puddle the dirt on their way. Sufficient water must, of course, be continually supplied. The gold and sandy matters collect at the bottom of the circle, and are removed at intervals and panned out.

A sketch plan and sections of a combined cradle and puddling machine, which we take from Alfred G. Lock's new work on "Gold," presented by Spon & Co., are shown in the accompanying figure.

The necessary power is derived from an overshot water wheel, eight feet in diameter, which communicates with the puddling shaft by two drums and a belt, and with the cradle by means of a rod connected with a crank fixed at the other end of the puddling shaft. The wash-dirt is thrown into the puddling trough, which is supplied with water, and in which revolves an axle furnished with twenty-five iron arms. Hence the wash-dirt mixed with water flows into the hopper at the top end of the cradle. The bottom of this hopper is of sheet iron, perforated with 3-16 inch holes. In the cradle are seven tiers of blanket tables, made of ¼ inch pine boards, and varying in length so that each one receives its due proportion of sludge from the hopper. The blankets are washed three times a week, and the slime is concentrated in an ordinary small cradle, the gold being finally amalgamated. The plan and sections are drawn to a scale of 6 feet = 1 inch. The cradle has an inclination of 6 inches and an oscillation of 12 inches.

THE construction of railroads this year has fallen off nearly one-half from the number of miles constructed the first of last year—2,509 miles, as against 4,990 miles last year.

Mining Improvements.



In conversation this week with Mr. Martin White, the well known mining man, we were pleased to hear him say that, in his opinion, mining matters in California will be much better for the next ten years than they have been in the past decade. He has traveled extensively through the State, and is an owner of considerable mining property, and it is his conviction that our mining interests are gradually improving. As long ago as the Comstock excitement, people left good properties here to prospect for silver in Nevada. Ever since then mining property in this State has been comparatively neglected. Lately, however, a decided improvement has taken place, and old properties have been re-opened in many parts of California. New mines have been opened too, which are being developed by persons of experience. Mr. White feels confident that California's mining interests are advancing in a very satisfactory manner.

Mr. White owns an interest in a drift claim at Snow Point, up above Moore's Flat, Nevada county. Some very rich specimens have been sent down from there of late, and recent news is very encouraging. He also has an interest in a mine near the famous Rainbow, Chipp's Flat, Sierra county. His mine is next the Gold King, owned by Mr. Wilder. The Gold King struck quartz at 100 feet deep, assaying $1,194.82 per ton. It is on the same lead as the Rainbow. Mr. White's claim is known as the Albany. He thinks the mining interests of Sierra county are greatly improving.

He has recently visited Arizona, going to the Copper Queen, at Bisbee, Tombstone mines, etc. The best prospect for a continued large camp in the Territory is at the latter place, in his opinion. The mining properties there, he is assured, will continue to pay largely for a long time to come.

Altogether, Mr. White considered the state of the mining industry as very encouraging indeed. Everywhere are indications of prosperity and improvement.

REPORTS from the Silver Mountain, Big Cottonwood, continue very encouraging. The big ore body is improving and the road to the mine is being pushed ahead vigorously.

COMBINED CRADLE AND PUDDLING MACHINE FOR AURIFEROUS CLAYS.

Prevention of Mining Accidents

Within the past few years, and last year particularly, so much care has been taken in Great Britain for the prevention of mining accidents, that a very marked decrease has become apparent. During the first half of 1883, there has been a singular, and what may almost be termed an extraordinary, immunity from explosions of a fatal character throughout the kingdom, when they come to be compared with similar occurrences in the corresponding periods of previous years. So far as can be ascertained, the number of fatal explosions to the end of June, was three, and the killed, only six, against 187 for the corresponding half year of 1882. But each of these three explosions were really preventable, so that with proper precaution, there should have been no death whatever from such a cause. Still, it is gratifying to find such a satisfactory state of things, which, in all probability, may be attributed to the introduction of more perfect systems of ventilation, the use of the best safety lamps, and the doing away with powder for blasting in many districts. It may be said that those localities where the mines are considered the most fiery, and where, in former years, the most terrible explosions recorded have taken place have, so far as the year has gone, been free from explosions. This has been the case as regards Yorkshire, Durham, Lancashire and Staffordshire, whilst only two persons were killed in South Wales.

When it is considered how large a mining field is covered, and how many thousands of miners are working underground in the deep English mines, this immunity from accident is remarkable. And it must be remembered, moreover, that a large number of the mines being worked are fiery, and liable to explosion at any time carelessness occurs. All three of the explosions referred to were due to naked lights.

The English government exercises close scrutiny, its duly appointed officials properly inspecting all matters relating to the mines where there is liability of accident. Managers have to pass examination as to their knowledge of appliances for working mines, and understanding of causes and prevention of accident. Everything is so systematic now, and such careful inquiry is made when accidents do occur, that, feeling the responsibility, the managers, inspectors and foremen have been made extremely cautious. This system is bearing fruit as the result of this year's working is shown. The number of accidents and losses of life has been greatly decreased. This shows that due care was all that was necessary, and that by properly guarding everything and exercising precaution, liability to accidents in mines is largely lessened.

THE WATER-EJECTOR IN MINING.—In the Bleiberg district, Austria, an application of the ejector has been made in mining. It is driven there by hydraulic power, to raise the water from a winze. It lifts 366 gallons a second from a depth of 92 feet, using 435 gallons of power water with a head of 617 feet, thus showing an efficiency of 12 per cent. It is expected, however, that this power will suffice to carry the winze down to 200 feet, so that the efficiency would then be fully 20 per cent. The ejector is now working only six hours a day, doing the work of 16 men at hand pumps in 24 hours. This system is, therefore, worthy of the attention of those who must sink at isolated points below a tunnel level in which a head of water is available.

CORRESPONDENCE.

Letter from New Mexico.

EDITORS PRESS:—I send you herewith a few items about the mines in this part of New Mexico. Our camp lies in the northwestern corner of Grant county, near the line of Arizona, eighteen miles from the copper mines at Clifton, and on the same belt. The leads carry copper, gold and silver—formation, porphyry, granite and syenite. The silver occurs in the form of black sulphurets and horn silver, the gold being included in the same rock. The copper lies principally in beds by themselves.

There are here a number of claims on which work has been done. Among these are the Mitchell, having one ninety and one fifty-foot shaft, and one hundred tons of ore on dump, averaging $96.60 silver and $5 gold per ton, and the Tuck mine, with the same amount of work, and ore out. The Silver Rain has two hundred and ten feet of work done on it—one shaft one hundred feet deep, another fifty feet deep, with sixty feet of drifts—and two hundred and fifty tons of ore on dump, averaging seventy-five ounces silver and $16 gold per ton. We have had a thorough sample made of our ores with the result above, which beats the Tombstone mines.

The Little Emily, the Great Eastern, Nugget, Diamond, Eagle, Rose, Rainbow, and a number of other mines, all look as well as those mentioned for the amount of work done on them.

In the West Camp, three miles from us, the Carlisle mine, which has a twenty-stamp mill, is turning out bullion in considerable quantities. The output of April was $48,000, with ten to fifteen stamps, and for May, under twenty stamps, some $65,000. The above are all in the Steeple Rock mining district.

Wood and water not over-plenty, but plenty of water will be reached in depth, and wood will last until the railroad gets through. The nearest depot is twenty miles off, with good roads to it. From Lordsburg on the railroad to Duncan is thirty-eight miles, and nine miles from there to this camp.

ARTHUR H. CADWELL.

Richmond, Grant Co., N. M., July 3, 1883.

The Boss Copper Smelters.

Two men, who are working at the Crown Point mine, Gold Hill, recently went out to the Ludwig copper mine, Mason valley, and melted up everything in sight in the shape of ore.

There was out there a thirty-ton water-jacket furnace, but none of the scientific smelters had ever been able to make it pay or do much with it. The men who went out from the Crown Point are two Baltimore boys—practical copper smelters. The father of one of the men has a copper-smelting establishment in Baltimore. The other has been all through Arizona, where he worked at the Copper King and other mines.

The pair took hold of the furnace out at Mason valley, and made a success of it from the start. They ran through 639 tons of ore—everything that was on the dump, just as it came out of the mine—and extracted over seventy tons of copper, which was molded into ingots, weighing from 100 to 700 pounds.

They used as fuel coke and charcoal, and say they can work to a big profit any ore that goes ten per cent in copper. They say there are plenty of mines in Mason valley and all through that region which yield ore very much richer than that worked by them at the Ludwig mine, and if any one wants it smelted, all he has to do is to put up a furnace and let them at it.

They say the ores here are just as easily smelted as any they have ever seen in Arizona or anywhere else. The young man who was down in Arizona says he has seen the same trouble with furnaces in that country, when professors from the colleges undertook to run them. He says they understood very well what to put into the furnaces, and all the chemical part of the business, but that was the end of their knowledge. When the furnace was charged and fired up, they had no practical knowledge in regard to running it, and failed without knowing why, but generally found fault with the construction of the furnace.

Out here at the Ludwig mine the two men ran through the whole dump, just as it was taken from the mine. The ore contains a good deal of cobalt and nickel, but they shoveled it all in together and brought it out in bars. Much richer ore than that they worked can be found in the Ludwig mine, but they determined to make a success of the whole mass as dug down.

The mine is twenty-five miles from the Carson & Colorado railroad. The station at which they take off coke for the furnace and to which they haul their bars is Stinking Wells. The Jones family—Senator J. P. and Sam—are principal owners of the Ludwig mine. The boys who did the smelting have our thanks for a neat little bar of copper weighing about a pound. They can be found at the Crown Point mine by anyone who has a furnace that he can't run and ore that will go ten per cent and over. —*Territorial Enterprise.*

BOOMING.—The Colorado river is higher at the present time than it has been for eight years, and the current is so strong that it is with great difficulty boats can be made fast to the shore. The large ropes, known as "hawsers," are snapped in two, as though they were but twine. The low bottoms along the river are all under water.

Our Local Industries.

Number of Persons Employed—Material Used and Value of Manufactures as Shown by the Assessor's Report.

The following statistics, showing the condition of the manufacturing and labor interests of this city during the fiscal year ending June 30, 1883, have just been completed in the office of Assessor Holtz. The figures give the number of establishments conducting the various branches of industry, the number of men, women, and boys employed in each, amount of material used and value of goods manufactured:

Agricultural implements manufactories, 2—Men employed, 60; value of manufactures, $120,000.

Air compressors manufactory, 1—Men employed, 10; value of manfactures, $7,000.

Artificial stone manufactories, 1—Men employed, 60; value of manufactures, $120,000.

Axle grease manufactories, 2—Men employed, 9; resin consumed yearly, barrels, 1,428; butter consumed yearly, pounds, 33,000; chemicals consumed yearly, pounds, 28,000; value of manufactures $49,000.

Barrel manufactories, 3—Men and boys employed, 250; barrels, half-barrels and kegs made annually, 453,000; horse-power of steam engines, 112; barrels made for use of sugar refineries, 104,000; syrup kegs made by tub and pail factories, 18,000; aggregate value of manufactures, $330,000.

Bag manufactories, 3—Men, women and boys employed, 340; aggregate value manufactured, $2,000,000; number of bags manufactured, 9,000,000.

Bedspring manufactories, 4—Men employed, 24; coppered wire used, tons, 166; aggregate value manufactured, $104,000.

Iron bedstead manufactories, 2—Men employed, 5; value of manufactures, $10,000.

Bellows manufactories, 2—Men employed, 6; bellows manufactured, 1,600; value of manufactures, $20,000.

Bedding manufactories, 7—Men employed, 100; value of manufactures, $350,000.

Billiard table manufactories, 3—Men employed, 19; billiard tables made, 120; value of manufactures, $16,000.

Boot, shoes and slippers manufactories, 138—Men women and boys employed, 3,400; value of manufactures $5,400,000.

Box manufactories (wooden), 6—Men employed, 330; horse-power of steam engines, 330; lumber used, feet, 14,500,000; value of manufactures, $600,000.

Box manufactories (paper), 3—Men, women and boys employed, 100; number of boxes made annually, 2,250,000; value of manufactures, $75,000.

Box manufactories (cigar), 3—Men, women and boys employed 260; number of boxes made annually, 2,250,000; value of manufactures, $265,000.

Brass foundries, 6—Men employed, 350; value of manufactures, including copper, 500 ton, $535,000.

Breweries, 34—Men employed, 356; hops consumed annually, pounds, 650,000; barley consumed annually, tons, 28,000; beer made annually, barrels, 320,000; aggregate value of manufactures, $2,205,000.

Broom manufactories, 10—Men employed, 65; value of manufactures, $230,000.

Brush manufactories, 6—Men employed, 67; value of manufactures, $137,000.

Candle manufactories, 2—Men employed, 70; candles manufactured, boxes, 150,000; value of manufactures, $350,000.

Clothing manufactories, 17—Men and women employed 2,300; value, including overalls, suits and underwear, $3,750,000.

Cigar manufactories, 223—Men, women and boys employed, 7,478; cigars made annually 102,900,000; cigarettes made annually, 15,000,000.

Cracker manufactories, 3—Men employed, 155; horse-power of engines, 110; aggregate value of manufactures, $500,000.

Chemical works, 2—Men employed, 52, nitrate soda used, ton, 1,800; sulphur used, tons, 1,860; nitric acid produced annually, pounds, 2,560,000; sulphuric acid produced annually, pounds, 10,501,000; muriatic acid produced annually, pounds, 423,600; value of manufactures, $520,000.

Carriage and wagon manufactories, 30—Men employed, 290; carriages and wagons made annually, 550; aggregate value of all branches, $100,000.

Car manufactories, 1—Men employed, 10; number of cars manufactured, 100; value of manufactures, $60,000.

Coffee and spice mills, 16—Coffee ground and roasted annually, pounds, 3,980,000; chocolate made annually, pounds, 450,000; spices ground annually, pound, 656,000; aggregate value of manufactures, $900,000.

Coffin manufactories, 1—Men employed, 11; aggregate value of manufactures, $20,000.

Coppersmiths, 1—Men employed, 33; value of manufactures, $126,000.

Cordage and rope manufactory, 1—Men employed, 150; hemp rope manufactured, tons, 3,000; horse-power of engines, 250; aggregate value of manufactures, $600,000.

Carriage and locomotive car spring manufactory, 1—Men and boys employed, 16; springs made, tons, 150; aggregate value of manufactures, $40,000.

Cutlery manufactories, 2—Men employed, 30; aggregate value of manufactures, $47,000.

Dry dock (floating), 2—Men employed, 15; capacity of docks (one 1,800 and one 800 tons), 2,600.

Dry dock (stone), 1—Length of excavation in solid rock (feet), 450; width of top (feet), 120; depth (feet), 30; width of entrance (feet), 90; capacity of length (feet), 425; capacity of drawing (feet), 20; capacity of pumps for clearing (per hour cubic feet), 325,368; tubular boilers of four-inch tubes, 4; dimensions of each boiler (diameter in inches), 25; dimensions each boiler (length in feet), 16; fire surface of boilers (square feet), 3,800; men employed, 6. Total cost of work, $675,000.

Electric machinery works, 1—Men employed, 30; capital employed, $10,000.

Elevator manufactories, 3—Men employed, 24; aggregate value of manufactures, $140,000.

Fringe factories, 2—Men and women employed; 90; aggregate value of manufactures, $85,000.

Flour and feed mills, 8—Men employed, 192; flour made annually, barrels, 375,000; hominy made annually, tons, 100; buckwheat and rye flour annually, tons, 650; oatmeal and groats annually, tons, 2,000; cornmeal and farina annually, tons, 4,500; feed barley, tons, 10,000, cracked wheat, tons, 320; split peas, tons, 232; graham flour, barrels, 1,600; cracked corn, tons, 2,040; ground feed, tons, 2,000; pearl barley, tons, 650.

Foundries, boiler and iron works, 17—Men employed, 2,400; pigiron, annually, tons, 24,200; bar iron used annually, tons, 25,600; rivets used annually, tons, 480; horse-power of engines, 2,100; California iron used to June 30th, tons, 7,000; aggregate value of manufactures, $4,700,000.

Fur manufactures, 3—Men and women employed, 150; aggregate value of manufactures, $500,000.

Furniture manufactories, 19—Men employed, 1,350; lumber used annually, feet, 7,000,000; aggregate value of manufactures, $2,328,000.

Gas works, 2—Men employed, about 460; capital stock, $12,000,000.

Glass works, 1—Men and boys employed, 180; furnaces, 2; pots, 14; aggregate value of manufactures, $175,000.

Glass cutting, 3—Men employed, 25; value of manufactures, $55,000.

Glove manufactories, 12—Men and women employed, 160; aggregate value of manufactures, $230,000.

Glue manufactories, 2—Men employed, 41; glue made, tons, 220; neatsfoot oil, gallons, 30,000; aggregate value of manufactures, $117,000.

Gutta percha and rubber manufactories, 2—Men employed, 8; sets machinery, 2; aggregate value of manufactures, $24,000.

Hat and cap manufactories, 18—Men employed, 80; aggregate value of manufactures, $275,000.

Hose and belting, 4—Hose made annually, feet, 1,800; belting made annually, feet, equal to one inch, 700,000; aggregate value of manufactures, $150,000.

Harness manufactories, 50—Men employed, 440; aggregate value of manufactures, $1,150,000.

Ink and muscilage, 1—Men employed, 13; number of dozen made annually, 13,000; aggregate value of manufactures, $18,000.

Ice manufactories, 3—Men employed, 15; tons made annually, 1,200; capital invested, $90.000.

Iron working machines, 2—Men employed, 35; value of manufactures, $125,000.

Japanning and galvanizing manufactories, 2—Men and boys employed, 20; aggregate value of manufactures, $4,800.

Jewelry manufactories, 16—Men employed, 175; aggregate value of manufactures, $650.000.

Laundries, white, 105—Men, women and boys employed, 935.

Laundries, Chinese, 186—Men employed, 1,300.

Lead pipe and shot manufactory, 1—Men employed, 30; lead pipe and shot made, tons, 1,750; horse power of engines (2) 500; aggregate value of manufactures, $200,000.

Lead smelting works, 1—Men employed, 116; horse power of engine, 60: aggregate value of manufactures, $400,000.

Last manufactories, 2—Men employed, 14; horse power of engines, 22; lasts manufactured annually, 29,000; aggregate value of manufactures, $12,000.

Linseed oil works, 2—Men employed, 60; oilcake, tons, 4,300; capacity of works yearly, gallons, 8.000,000; value of oil, $580,000; value of cake, $135,000.

Macaroni and vermicelli factories, 8 Men and boys employed, 56; macaroni and paste made, boxes, 200,000; flour used, barrels, 12,000; horse power of engines, 110; aggregate value of manufactures, $200,000.

Marble works, 35—Men employed, 180; aggregate value of manufactures, $290,000.

Match factories, 2—Men employed, 90: matches made annually, gross, 300,000; value of manufactures, $125,000.

Malt houses, 6—Men employed, 100; grain malted annually, tons, 30,000; value of products, $160,000.

Mirror manufactories, 2—Men employed, 9; number of square feet manufactured, 5,500; capital invested, $190,000.

Musical instrument manufactories, 2—Men employed, 35; aggregate value, $40,000.

Oil clothing manufactories, 4—Men employed, 35; aggregate value of manufactures, $60,000.

Oakum manufactory, 1—Men employed, 20; bales made annually, 13,000; aggregate value of manufactures, $52,000.

Pickle and fruit-preserving manufactories, 12 Men and women employed, 2,000; fruit and meat put up, dozen cans, 600,000; pickles put up in kegs, 90,000; aggregate value of manufactures, $1,600,000.

Provisions packing, 2—Men employed, 160; meat, packed, barrels, 10,000; pork packed, barrels, 10,500; ham and bacon, pounds, 3,000,000; lard, pounds, 2,300,000; tallow, pounds, 1,300,000; value of investment in real estate, fixtures, etc., $165,000; aggregate value of products, $2,000.000.

Rolling mill, 1—Men employed, 540; horsepower of engines, 725; scrap-iron used, tons, 26,095; coal consumed, 18,956; aggregate value of manufactures, $1,868,320.

Salt works, 3—Men employed, 32; run of stones, 8; number of tons annually, 30,000; aggregate value of salt ground, $250,000.

Safe and vault works, 4—Men employed 20; bar and plate-iron used, tons, 53; horse-power of engines, 60; steel used, tons, 35; aggregate value of manufactures, $95,000.

Saw manufactories, 2—Men employed, 41; horse-power of engines, 44; steel used annually, tons, 61; aggregate value of manufactures, $122,000.

Sash and doorblind and finishing manufactories, 15—Men employed, 1,550; horse-power of engines, 1,050; lumber consumed annually, feet, 10,055,000; aggregate value of manufactures, $5,010,000.

Silverware manufactories—Men employed, 45; aggregate value of manufactures, $150,000.

Shipyards 4—Men employed 200; number of steamers, barges and other vessels built, 33; tonnage, 6,000; aggregate value of crafts built, $500,000.

Shirt manufactories, 7—Men and women employed, 2,550; value of manufactures, $950,000.

Soap manufactories 17—Men employed, 130; soap made annually, 15,256,000 pounds; aggregate value of manufactures, $715,000.

Soda works (bi-carb soda and saleratus), 1—Men employed, 10; salsoda manufactured 800 tons; saleratus manufactured, 400 tons; value of manufactures, $100,000.

Sugar refineries, 2—Men employed, 360; sugar (raw used), 80,000,000 pounds; white sugar made, 50,000,000 pounds; yellow sugar made, 28,000,000 pounds; syrup made, 450,000 gallons; aggregate value of manufactures, $8,700,000.

Tanneries, 43—Men employed 335; horse-power of engines, 172; bark used annually, 5,000 cords; hides of all kinds, 360,000; aggregate value of manufactures, $1,700,000.

Tinware, tin box and can manufactories, 4—Men and boys employed, 180; value of manufactures, $525,000.

Type foundries, 3—Men and women employed, 35; aggregate value of manufactures, $34,500.

Vinegar manufactories, 2—Men employed 22; vinegar made annually, 1,600,000 gallons; aggregate value of manufactures, $255,000.

White lead factory, 1—Building 45x275, 4 stories, brick; men employed, 75; number of tons manufactured, 3,000; capital employed, $290,000.

Windmill manufactories, 2—Men employed, 16; mills made annually, 160; aggregate value of manufactures, $41,000.

Willow and woodenware and basket manufactory, 1—Men employed, 32; value of manufactures, $250,000.

Wine and beercask manufactory, 1—Men employed, 100; number of casks made annually, 3,000; value of manufactures, $200,000.

Wire and wire rope manufactory, 1—Men employed, 50; horse-power of engine, 125; amount of wire consumed annually, tons, 750; aggregate value of manufactures $360,000.

Woolen mills, 2—Men and women employed, 1,500; number of power looms, 162; cards, sets, 60; frames for knitting underwear, 28; frames for knitting hosiery, 24; spindles, 21; blankets made annually, pairs, 80,000; knit underwear, dozens, 6,000; hosiery, dozens, 25,000; wool used, pounds, 5,400,000; cloth and tweed, yards made, 600,000; flannels, yards, 1,600,000; aggregate value of manufactures, $1,900,000.

Carelessness in Mining and Assorting Ores.

On this subject, the *Black Range*, of Colorado, has this to say: Many mines, in prosecuting their business in this country, have paid too little attention to the formation known as talc. This substance is generally found in the neighborhood of mineral, and common custom has assigned it to the dump. That there are formations that carry mineral other than the general accepted ores is being proved so conclusively, that to say anything is barren is making an assertion that is likely to give the lie on test. Carbonates, in the early days of Leadville, were known to exist, but were supposed to be valueless, and hence the bonanza camp lay for years undeveloped and unthought of, other than for its placer mines. Tellurium is another metal, which, though unknown to experts, is not generally known at sight by most miners, and tons have been consigned to the dump because they could not see anything that looked like mineral in it. Recently at Bonanza, Colorado, some miners working a prospect were throwing this valuable mineral over the dump, and other parties coming along and seeing it bought the property for a fraction of what was in sight and on the dump. Lately the Nellie S. mine, on Printer Boy Hill, Leadville, has been consigning talc to the waste dump that on assay runs from $20,000 to $50,000 a ton in gold. The Palomas Chief has given us some magnificent specimens of native silver in talc, and now and then the Cuchillos are furnishing specimens that are plentifully specked with silver. To prospect thoroughly, formations lying adjacent to bodies of mineral should be assayed, and hearsay or common custom dispensed with. The fact that we cannot see mineral in rock is no evidence that it is not there, and more caution should be observed about rejecting mineral substances with which we are not well acquainted.

SMELTING AND LEACHING ORES IN COLORADO. At Golden, Colorado, the ore having been crushed by rock breaker and Cornish rolls, is dropped through shutes to the calcining department below. Ores which contain zinc, sulphur and antimony are roasted in the calciners, where the sulphur is expelled, after which the ores are removed to the smelting department, and there melted. The copper, gold and silver being the heaviest parts, sink to the bottom, and the slag, or worthless residue, remains on top and is skimmed off. The gold, silver and copper, or matte, which is obtained from the smelting, is then crushed until it will pass through a screen of eighty meshes to the square inch. The matte, which is now as fine as flour, is then taken to the refining furnace and again roasted. After this, it is ready for the leaching tubs; and here, to the stranger, is the interesting part of the works. In this room the silver is separated from the matte, and obtained in almost a pure state. The matte is placed in the leaching tubs through which hot water is running. The silver in the matte is now dissolved in the hot water, and the hot water, with the silver in solution, passes out of the tubs into silver cisterns. These cisterns contain several copper plates, and the water, with silver in solution, passing over them, loses the silver, it being precipitated upon the copper plates in the form of a sponge. The cisterns are cleansed once a week, the silver melted in a crucible, and then molded into bricks for shipment.

TOO MUCH OIL.—One day last week the east-bound overland train on the Central Pacific Railroad met with a singular delay between Verdi and Truckee. A freight train was immediately in front of the passenger train, and had among other cars one of oil, which leaked badly, flooding the rails with oil, and the overland train, when it reached the spot, came to a standstill. The sand boxes were opened, and it was with great difficulty that the train could be moved at all. Finally it was cut in two, and each part started separately. It took two hours to make a distance of five miles.

MECHANICAL PROGRESS.

The Needed Bran Compressor.

We referred, a few weeks since, to a reward for a bran compressor. We have since observed that the reports of the patent office begin to teem with bran packers, compressors or consolidators. Their inventors have a difficult problem, but nothing is impossible to modern mechanics; and we shall soon have, beyond a doubt, a practical machine for compressing bran into suitable shape for exportation.

In regard to the great commercial need for such a device, the *Northwestern Miller* informs us as follows: "Millers frequently say: 'I don't care anything about a bran compressing machine. I don't export anything, and can't see what benefit it will be to small millers," which shows the brevity of human vision. If the large mills do export their bran to Europe, the market at home will be left free for just so much more bran and offal from the smaller ones, and to that extent profitable milling will be increased. If enough bran is exported to close a hundred or a thousand European mills, (and many of them could not run, were it not for the ready sale of their offals at high prices) American mills will have just so much more to do. This is the reason why a bran compressing machine is needed by the whole trade, and why it will be just as beneficial to the millers who never see it as to those who buy it and use it.

Has it occurred to any of the inventors and advocates of bran compressing machines to figure on the probable gain through the use of such machinery? When they come to estimate it they will find the margin extremely small, unless the railroads experience a decided change of heart. At present, with an ordinary bran packer, it is easy to get 224 pounds of bran into a sack, ten such sacks making the ton of 2,240 pounds, which is the rule in Europe. In this form, rates of freight can be secured as low as on flour to the seaboard. Compressed bran can go at no better rate under present tariffs. On the ocean a difference of about seventy-five cents per ton can be obtained in favor of the compressed article. So at present we have this seventy-five cents on one side of the account, and the extra expense of compressing the bran (whatever it may be) on the other, with a good demand in existence for non-compressed bran on the one hand, and a prejudice against the compressed article on the other. We are not croaking, but are stating the facts just as they exist. To make bran compressing possible and profitable the railroads must discriminate in its favor, and the British and continental public must be educated up to its use. Here is good work for the National Association."

How Screws are Threaded.

We condense from a cotemporary as follows: Screw threads are generally originated in a lathe. All lathe turning with regular and constant feed is screw-cutting or threading. It is therefore evident, that with a proper speed, feed and tool, a screw thread would result.

Many screws are threaded by dies, which may be called hollow screws or nuts with cutting edges. These are sometimes worked by hand, often by power. The old-fashioned dies were adjustable so as to be "set up," and could be made to cut several sizes or diameters.

There is another method of cutting threads direct from the solid—by milling. The machine is entirely automatic, the blank to be cut being rotated as in a lathe, and a rotary milling tool rotating against it.

Threads on large screws are sometimes formed by being cast—a cast iron screw.

For some peculiar purposes threads are formed by simply twisting a square or flat bar—a common form of hand drill which has superseded the bow drill being a case in point. A familiar instance of a screw thread of this description is the ordinary auger or bit.

Another peculiar method of forming screw threads is that of raising a thread by rolling between dies, under pressure. Much of the "bright wire goods" in the market is made in this manner; the thread being generally formed by simply rolling—one revolution or a little more—the wire between two hardened steel plates.

The threads in nuts are produced either by the "originating" method, cutting them in a lathe as above described, by being tapped, or cast of soft metal, as brass; on a threaded core of hard metal as of iron or steel. But nuts are more generally made by tapping, running one two or three successive taps through them, either by hand or power.

Nuts of very thin material, as sheet brass for lamp tops, etc., are formed simply by rolling between spirally corrugated rolls—a work analogous to "beading" on tin ware.

NAILS IN THE DAYS OF OUR GRANDFATHERS.—There is scarcely any manufacturing process in which greater progress has been made, during the last century than in the production of nails, tacks and bolts. To obtain the supply of nails during the last century was, by no means, the easy problem that it is now, and many substitutions and make-shifts, such as wooden pins, bolts, clamps, riders, etc., were resorted to, to supply the inevitable deficiency. Says the *Age of Steel*, all nails were hammered out by hand at the anvil, and nothing like uniformity in weight or size was attempted. All were of wrought iron, and at best clumsily constructed, and, because of their softness, when one was once started the driver was never sure of its ultimate direction. Every hard substance turned them aside, and holes had to be bored for them in hard wood. Unavailing efforts were made to cast nails singly in molds, but from their brittleness they were found worthless. We have now at hand some nails that were made in England and brought to Virginia in the early part of the 18th century. Like all their prototypes, these are rudely shaped, generally sharp at the point, like a modern horse nail, thence rapidly getting thicker to the middle, whence they taper slightly to the head. The latter has in all cases been entirely disfigured by driving. They are all sizes, from half an inch to five inches in length, thick or thin, without regard to length, and bearing everywhere the imprints of the hammer. When we consider how long it must have taken the blacksmith to pound out a keg of these, we can form some slight conception of the advantages we enjoy from modern methods and appliances.

AMERICAN VS. ENGLISH NAILS.—The *London Iron Monger*, of a late date says that owing to indifference to brand on the part of English manufacturers and shippers there is a steadily growing demand for American nails, not only in the Australian Colonies, but in the markets of South and Central America. American nails, indeed, are now an important item of trade with the markets alluded to, and it is only in exceptional cases, or by the adoption of direct representation, that English makers of reputation are able to hold their own. The home demand was reported fairly good until the reduction declared a few years ago, which appears to have had the contrary effect to that intended, and buyers have since been holding off as if in doubt whether prices had really touched the bottom yet. In the export department the principal trade stirring of late has been with Australia, Chili, and the North of Europe.

SPIEGELEISEN.—But five companies in the United States make the peculiar kind of iron known as spiegeleisen: the New Jersey Zinc and Iron Company; the Cambria Iron Company, Johnstown, Pa.; Carnegie Brothers & Co., Limited, Pittsburg; the Briar Hill Iron and Coal Company, Youngstown, Ohio, and the Lehigh Zinc and Iron Company, Limited, Bethlehem, Northampton county, Pa. These five companies made only 21,963 net tons last year. Spiegeleisen is made in New Jersey, from a zinc ore, known as Franklinite. After the extraction of the zinc the residue is smelted to produce the spiegeleisen, which is a very peculiar white iron, valuable for steel-making from its high percentage of manganese—10 to 24 per cent. The original zinc ore is iron black in color, and leaves a brown streak.

A SAFETY VALVE should be large enough to discharge all the steam the boiler is capable of making. The following rule is that enforced by the United States Government in fixing the area of safety valves for the boilers of ocean and river vessels when the ordinary lever and weight safety valve is employed: When the common safety valve is employed, it shall have an area of not less than one square inch for each two feet of grate surface. The following rule has been prepared by Prof. Thurston: Multiply the pounds of coal burned per hour by 4, and divide this product by the steam pressure, to which the constant number 10 is added.

STEEL NAILS.—We mentioned some time since that the manufacture of nails from steel was to be commenced soon in Pennsylvania. The Harrisburg Nail Works' Co., have commenced the experiment and report that they have succeeded in producing a fine article. The nails are manufactured from steel made at the Pennsylvania Steel Works, the quality the same used in making rails; the nails are pronounced to be superior to the iron nail. They are nicely finished, and drive into the hardest of wood without bending.

LOCOMOTIVES FROM EUROPE.—So great is the demand upon the locomotive builders in this country, at the present time, that large orders have recently been sent to Europe, which could not be filled in season in this country. A large order has been received by Messrs. Nasymth & Co., of Lancashire, Eng., who will construct the engines ordered from American specifications after the strictly American type—it is said that all the locomotive makers in the United Kingdom are turning out only fourteen engines per month.

ROLLING LIQUID IRON.—To roll molten iron or steel in a liquid state, a rolling-mill has been proposed in which the rolls are to be cast hollow so as to receive a current of water, which will maintain a sufficiently low temperature. The metal is to run from a "hopper" or distributer and fall between the rolls, becoming cooled on contact with them. It is supposed that this method of rolling will have the effect of freeing the metal from any gases which it may contain.

STEEL NAILS are largely in use in England, and are said to be rising in favor, and some makers are doing rather a brisk trade in triangular and grooved nails, which are said to possess considerable strength and holding power relatively to their weight.

SCIENTIFIC PROGRESS.

Science and Progress.

It took the world many centuries to reach her present stage of intellectual development—the stage in which the highest intelligence and the best efforts of human activity are enlisted in the pursuit of science; but, having reached this stage, the wonder is, in view of the wholesome results that we are reaping from it, that the theologians and metaphysicians should so long have been able to exercise the dominating influence over the minds of men that history shows them to have done.

What the world owes to the creators of dogmas and architects of sects, let history tell. For nearly eighteen centuries they were the sole repositories of the learning (?) of Europe; the intellectual forces of the world centered in them and emanated from them. How they benefited mankind, how they advanced civilization, the pitiful pages of mediæval history record to their everlasting shame. Nor was this long period of darkness simply one of intellectual atrophy. It was an age of violent repression of everything that savored of independence of thought. Intellectual activity, unless indeed it was exercised in the direction of riveting still more strongly the fetters of mental bondage upon mankind, was a crime that was sure to bring down upon the irreverent actor condign punishment, for the thinkers and philosophers of those days were so fully taken up with matters relating to the future world, that they condemn man to intellectual slavery in this. Having the world entirely in their hands, they not only failed to advance it mentally, morally and physically, but they let and hindered those who might and could have done so.

Happily those times are past, and the world has entered upon a brighter epoch, in which freedom of thought is not esteemed to be a crime. What the coming centuries may have in store for the human race the future only will reveal; but if we may judge of the intellectual and material advancement of the twentieth century from that of the nineteenth, the coming man will be as far in advance of the man of to-day as the latter is in advance of the unwashed fanatic of the Middle Ages.—*Manufacturer and Builder.*

A Submarine Observatory.

If all that is stated in the following is reliable, the story of M. Jules Verne in his "Ten Thousand Leagues Under the Sea," may come nearer to being realized than has hitherto been dreamed of. A correspondent of an English technical journal writes to the effect that the forthcoming international exhibition of Nice is reserving some wonders for those who may propose to pass a portion of the winter of 1883–84 upon the borders of the Mediterranean. One of these wonders is a balloon which its inventor, M. Toselli, calls "the observatory under the sea." It is made of steel and bronze, to enable it to resist the pressure which the water produces at a depth of 120 meters. This observatory under the sea has a height of eight meters, and is divided into three compartments. The upper compartment is reserved for the commander, to enable him to direct and to watch the working of the observatory, and to give to the passengers the explanations necessary as to the depth of the descent, and what they will see in the depths of the sea. The second division, in the center of the machine, is comfortably furnished for passengers to the number of eight, who are placed so that they can see a long distance from the vessel or machine. They have under their feet a glass which enables them to examine at their ease the bottom of the sea, with its fishes, its plants and its rocks. The obscurity being almost complete at seventy meters of depth, the observatory will be provided with a powerful electric sun, which sheds light to a great distance in lighting these depths. The passengers have at their disposal a telephone, which allows them to converse with their friends who have stopped on the steamboat which transports the voyagers to such places as are known as the most curious in the neighborhood. They have also handy a telegraph machine. Beneath the passengers, the third compartment is reserved for the machine, which is said to be constructed on natural principles—that is to say, as the bladder of a fish, becoming heavier or lighter at command, so as to enable the machine to sink or rise, at the wish of the operator. If all that is stated is true respecting this wonderful "machine," we may well exclaim, What next?

Wine Ferments.

The researches initiated by M. Pasteur upon the alcoholic ferments, promise to have an important influence, not only upon beer brewing, but upon the apparently less artificially conducted process of fermentation that goes on in the production of wine. It seems quite probable that the quality of wine of any year is as much affected by the particular mold which predominates during the fermentation, as by the amount of sunshine or rain during the growth of the grapes, or even the passage of a comet through the sky. In Germany, it is already the practice to sterilize the must and then to sow it with some selected ferment, a process favorable to the elimination of various "false" ferments (species of *Dematii*) that are common to the surface of the grape and other fruit, while the custom in some southern countries of decanting the must as soon as the first foaming appears, may have the same effect. In a recent communication (*Comptes Rendus*, xcvi, 1,369) M. Le Bel incidentally remarks that last year none of the grape collection with which he had to do underwent fermentation influenced by what Pasteur considers to be the true wine ferment, (*Saccharomyces ellipsoideus*, Rees, but was all fermented by *S. Pastorianus*. M. Le Bel also states that a natural must yields a larger proportion of the higher alcohols than a solution of sugar fermented with the same ferment, and as the higher alcohols are more injurious to health than ordinary alcohol, it would appear that a beer made partly from sugar is quite as wholesome as one made solely from malt.

THE STORAGE BATTERY.—When the "storage battery" was so far improved as to win indorsement from Sir William Thompson, it was thought that by its aid the electric lamp would be rapidly introduced into dwellings; but the storage batteries can hardly be said to answer satisfactorily the expectations formed of them. Some experts claim that they have demonstrated by experiment that the storage battery as now constructed is too costly for practical use. The late discovery of this fact is because the cost of the battery is greatly increased by the serious deterioration it undergoes. If it were permanent, as it was at first supposed to be, it is not too costly; but if it depreciates at the rate of at least thirty per cent per annum, as is alleged, it is not commercially useful, except for limited kinds of work. On the other hand, it may be said that there is still hope of finding means to make the storage battery permanent and cheap enough for practical use. Sir William Thompson, out of several hundred batteries, has found one or two that unaccountably last without depreciation, while the others fail. It is the "unaccountable" in the successful batteries that remains to be discovered and applied to all. If one will work, all can be made to work, though it may require considerable research to find the conditions essential to success.

WHAT IS CARBON?—Mr. Berthelot, in the *Journal de Pharmacie et de Chimie*, treats of the elementary constitutions of carbon in a somewhat novel style. He says that from certain peculiar physical relations he is inclined to think that the true element of carbon is not yet known, and that it will eventually be found that graphite and diamond are not really identical, but are substances of a different order. M. Berthelot alleges that elementary carbon ought to be gaseous at ordinary temperatures, and that the various kinds of carbon which occur in nature are in reality polymerized products of the true element of carbon. Spectrum analysis is considered to confirm this view; for a spectrum recognized along with that of hydrogen in the light of comets is held to indicate a gaseous carbide, probably acetylene. If this hypothesis should be maintained by further research, it will be shown that the claim advanced on behalf of hydrogen to be considered as the fundamental element of the universe must be modified to embrace carbon. The spectrum in question is also shown by the Geissler tube.

RARELY in the history of science, says the *Lancet*, has a distinguished career equaled in its length that of M. Chevreul, whose name is best known in connection with his investigations on color; and it is probably altogether unique for a savant to be able, before one of the most distinguished scientific societies in the world, to refer to remarks which he made before the same society more than seventy years previously. Recently M. Chevreul made a communication to the Academie des Sciences, and at its close he observed: "Moreover, gentlemen, the observation is not a new one to me. I had the honor to mention it here, at the meeting of the Academie des Sciences, on the 10th of May, 1812!"

HUMAN HAIR UNDER THE MICROSCOPE.—E. B. Tylor, in *Nature*, says that the microscopic examination of the cross section of a single human hair is sufficient to determine to which one of the race divisions of humanity the wearer belongs. If examined microscopically by Pruner's method, it shows circular, or oval, or reniform. Its follicle curvature may be estimated by the average diameter of the curls as proposed by Moseley. Its coloring matter may be estimated by Sorby's method. There has been even a systematic classification of man published by Dr. W. Muller, of the Novara expedition, which is primarily arranged according to hair, in straight-haired races, curly-haired races, etc., with a secondary division according to language.

PHOTOGRAPHIC SPEECH.—Deaf-mutes are taught to speak and comprehend by watching the movements of the lips. According to the *Photographic News*, M. Wanerke has photographed the face of a man in which these movements were perfectly defined, so as to have the exact form corresponding to each sound. By means of these photographs inexperienced persons have been enabled to recognize the different articulations.

A NEW vegetable parasite, *Haplococcus reticulatus*, has been recently discovered in pork by Dr. Zopf. It occurs in from thirty to forty per cent of the animals examined. Would it not be well if we paid more attention to the sanitary legislation of Moses, a fragment of the ancient medical law of Egypt?

COLORADO, in the first six months of 1883, produced 226,947 tons of coal and 74,208 tons of coke.

Mining Share Market.

The volume of business in the stock market is small, and there is not much going on. The situation on the Comstock is unchanged, although close attention is paid to all news from there. The Standard mine of Bodie has paid a total of $84 per share in dividends, including the last one. The Benton Consolidated company at its annual meeting showed receipts for the year at $41,518, of which some $21,000 came from assessments. The Lady Washington company had receipts in the year of $9,921, of which $5,373 was from assessments, and $4,285 was a balance.

Bullion Shipments.

Horn Silver, July 20th, $9,000; Ontario, 20th, $4,318; Stormont, 21st, $2,021; Horn Silver, 21st, $12,000; Ontario, 21st, $4,548; Horn Silver, 24th, $24,000; Ontario, 24th, $9,014; Mt. Diablo, 19th, $6,124; Bodie, 23d, $3,140; Northern Belle, 19th, $6,029; Christy, 23d, $8,188; Standard, 23d, $14,306; Northern Belle, 23d, $5,973; Contention, 21st, $16,113. During the week ending July 21st, inclusive, there were shipped from Salt Lake thirty-six cars of bullion, 963,190 pounds; thirteen cars ore, 344,020 pounds, sent west; thirty-three cars ore, 603,000 pounds, sent to Colorado; making a grand total of eighty-two cars, aggregating 1,940,210 pounds.

LIGHTING THE ARIZONA MINES.—A number of mining companies in Arizona, says the *Citizen*, are about to adopt the electric light, to facilitate operations underground, as well as on the surface; among these are the Silver King Mining, the Howell Smelting, and the Conger Mill and Mining companies. At the Silver King mine it is proposed to use four 3,000 candle power Brush lights above ground and two below, together with twenty-five small incandescent lamps. The dynamo located near the main shaft will supply the current, descending 800 feet to the lower levels of the mine to the arc lights and storage boxes, from which latter the Swan lamps are to be connected by small copper wires. Fixed lamps are to be suspended from the roofs of galleries, and the portable lights are to be attached to flexible conductors for convenience of shifting. These lights are to burn continuously, night and day. In the reduction works of this company, both large and small lights are also to be used, a separate dynamo and two storage batteries supplying the current. The arc light circuit in this mine will be about half a mile in length.

A CHICAGO company is building machines for "consolidating" various waste products into compact blocks for use as fuel. Sawdust, shavings, etc., from saw and planing millsare pressed into molds so that 400 to 900 cubic feet of the loose material are compacted into less than forty cubic feet of blocks of convenient size and form to be used as fuel.

ON the French railroads the average number of employes per mile is far greater than on American lines. Some roads there average thirty-one, while the United States average is only five.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

PLYMOUTH.—Amador *Dispatch*, July 21: There is no mining being done outside of the Empire and Pacific mines, and probably won't be until time to work out the yearly hundred dollars and just hold the claim.

Butte.

CARPENTER'S FLAT.—Oroville *Mercury*, July 20: Capitalists are projecting a scheme, which, if carried into effect, will make Oroville one of the greatest mining centers in the world. That is the organization of a company to mine Carpenter's Flat to the bedrock. It is a well known fact that the entire flat is rich in mining ground, but as yet no adequate method has been employed to get rid of the water, which is encountered at a short distance from the surface. The new company propose to work it by means similar to those in operation in the silver mines on the Comstock lode. Powerful pumps are to be placed at different points, and it is believed that all the water can thus be got rid of. The working of this vast gold field will necessitate the employment of thousands of men. We are not at liberty to divulge the names of the projectors, but can state that they are gentlemen who are wealthy, and that their plans will be put in operation at no distant day.

MOORETOWN.—Rich. Dickenson, who resides a short distance east of Mooretown, brought to our office this morning some fine specimens of quartz taken from a ledge which crosses Sucker Run not far from his house. He represents the ledge as being fifty feet wide, and the specimens brought down by him as a fair sample of the entire ledge. The ledge crops out from both sides of Sucker Run, and thousands upon thousands of tons of rock can be obtained above the water level. There is splendid water power near for the driving of all machinery necessary for the working of the rock. He also brought a specimen of marble which was taken from a ledge on the creek, about half a mile above where the quartz ledge is found. This ledge of marble is about fifty feet wide, and where the creek cuts through it, it crops out to a height of seventy-five feet. Mr. T. W. Reece has taken specimens of both quartz and marble, and will send them to San Francisco for exhibition. A specimen of the marble will be sent to W. H. Plenire, Marysville, for testing.

INDIAN SPRING MINES.—Chico *Enterprise*: The managers of the Indian Spring mines, some five miles above Magalia, have recently been prospecting their cement, and find it to be rich beyond all anticipations. The tailings, even after being run through a second time, yield from $40 to $500 per ton. Mr. McLean says he can pick up at any time from twenty-five cents to four or five dollars from these old tailings. The discovery has caused quite an excitement, and a ten-stamp quartz mill is to be put in within sixty days. Very encouraging prospects, also, from the Red Hill mine, where an additional force of forty men will begin work in a few days.

Calaveras.

MURPHY'S.—San Andreas *Citizen*, July 21: The Oro Plata mill has started up with the new concentrators, five in number, with space for two additional ones if needed. The Frue Concentrators have been in use a number of years, and have given satisfaction wherever they have been in use. Mr. Miller is erecting a ten stamp mill on the Sunny Side mine, a property located in the Collier district near the celebrated Collier mine. Tom Goodwin, superintendent of the Calaveras mine, returned from the Bay last week. He speaks hopefully of the future of this mine. Supt. McNevin of the Washington mine is convalescing. The mine will soon be under his personal supervision.

Contra Costa.

EMPIRE COAL MINE.—Antioch *Ledger*, July 21: The Empire is better than ever. Last month they took out and shipped between 4,000 and 5,000 tons of coal, and expect to do the same this month. The coal is of first quality, it gives good satisfaction, and the demand for it is continually increasing. The mine is in excellent working order, with coal in sight enough to keep up the supply for years.

El Dorado.

GARDEN VALLEY.—Georgetown *Gazette*, July 21: The Rosekrans mine, has introduced an air compressor, and will hereafter use Burleigh drills. This mine is about three miles south of Georgetown. The Taylor mine near by, idle for so many years, is in the hands of men in San Francisco who have refused several offers for the property.

GREENWOOD.—The Morrell Con. M. Co.'s claim is now the center of attraction. In a drift run from the old tunnel splendid ore has been struck, and at a depth of 20 ft lower, from the new tunnel, the seam has also been found, showing a great improvement both in size of lode and quality of the ore, the gold brightly glittering in large blotches through the rock, which also shows fine gold in liberal quantities. In about 10 days the mill will be ready to operate.

Mono.

MOUNT CORY REDUCTION WORKS.—Bodie *Free Press*, July 21: Peter Huff, of Virginia city, has been awarded the contract to lay the foundations and perform other masonry work for the Mount Cory reduction works. He left Virginia on Friday for the scene of his labors. Mr. Huff tells the *Chronicle* that the quarry, which is situated about a mile and three-quarters from the mill site, is the finest in the State.

DETROIT COPPER WORKS.—C. H. West was out at the Detroit Copper company's works Thursday, and reports matters progressing very finely there. The company will make a shipment of a carload, or ten tons, of copper bullion on Sunday. The bars are from 250 to 500 pounds in weight. A specimen bar of 65 pounds was brought in by stage Friday.

BODIE VS. ARIZONA. The *Free Press* of the 20th inst. gives the experience of Mr. V. B. Cross, an enthusiastic Bodicite, who has just returned from New Mexico and Arizona, and who contrasts the prospects of these with those of Bodie in the following style: The most prolific thing in the country is the newspapers. These papers write up the mines and the country in the most extravagant and unblushing manner. They make a regular business of going around the country in droves of from a dozen to twenty-five reporters, writing up the mines that there is nothing in, and giving glowing descriptions of agricultural and grazing land that is so burned up that a jack rabbit would starve to death if turned loose on it. The country is full of "tenderfeet," who do not know a mine when they see it. The discovery of a hatful of ore will build up a town in a week. Mr. Cross engaged in frequent altercations with these ignorant people upon the subject of mines, and often informed them that if they had such a mine as the Standard of Bodie, they would get together a city of forty thousand people—which is a fact, in his opinion.

Nevada.

MAGENTA. Grass Valley *Union*, July 20: A meeting of the stockholders of the Magenta Consolidated was held on Wednesday evening for the purpose of increasing the capital stock from 20,000 to 100,000 shares. The vote in favor of the increase was unanimous, and it was voted that 20,000 shares should be set aside to be sold as a working capital, the price to be fixed at fifty cents per share. It was also decided to put up steam hoisting works on the mine. The Majenta adjoins the Empire company's ground, and is regarded as a property that will become very valuable. There is now a good working incline shaft on the claim to the depth of 350 feet.

MURCHIE.—Nevada *Transcript*, July 20: The Murchie is looking very well; turning out enough ore to keep the two mills (18 stamps in all) running right along. The Big Blue lead keeps up its reputation, while the Independence lead, which had been virtually abandoned when superintendent Tilley took charge, is improving. The mine is paying well now, and it is to be hoped that the days of assessments are passed, so far as it is concerned.

BANNER.—A crushing of 3,000 pounds of ore taken from the upraise on the 600 level north of the Banner mine paid $300, or at the rate of $200 a ton. There is more of the same kind yet in sight.

THE IRON MINE.—*Transcript*, July 6: Deputy Assessor Wheeler gives some interesting items about the iron mine 20 miles below Grass Valley. Using 80 bushels of coal to the ton of iron, the mine is now turning out 2½ tons of iron per day, and one day 30 tons were turned out of the furnace. Last year 185 bushels of coal were used to turn out one ton of iron. There are now 165 men employed about the mine. The mine is in a better condition than it has ever been, and wood-choppers and teamsters are in demand there.

Plumas.

QUINCY.—*National*, July 21: See & Jolly's mill has been running on good rock all the spring, and they are taking out some good ore now from the Specimen Ledge. Considerable mining has been done this spring and summer at Willow creek, and some good sized chunks taken out. The Spanish boys found a chispa weighing seven ounces, a short time ago, in their claim across Willow creek from Levasse's. Levasse has made a good spring's run. The Young California ledge on Mt. Ararat, below the Marlett channel, is paying very well. The owners work their rock in an arrastra. Quite a number of hydraulic claims are in full blast on the Middle fork, among them Jack DeLaps', and the boom of the water can be heard from the top of the mountain, two miles away.

Shasta.

FURNACEVILLE.—Redding *Free Press*, July 21: A correspondent says: Our mining interests here seem to be very favorable. Some excellent appearing bullion is being turned out under the management of Mr. Stewart, the superintendent, who appears to be well pleased with the prospects, and we may now consider the Afterthought works a success. Recently a fine body of ore was uncovered in the Peck mine, the assays of which are very good. Some other work is going on in the district. Various detentions have occurred, so that the mill has not been run continuously. The flume conveying water to the mill had been built for a number of years, and broke down in two or three places, but was soon repaired. Some of the machinery did not work well on the start, but everything is now going along right.

Sierra.

GIBSONVILLE. *Tribune*, July 19: Cox & Gurley have just wound up the season's work in their hydraulic mine; $30,000 was the amount cleaned up. The back channel of the Union drift mine is improving in extent and richness equal to the front channel, which was worked out in earlier years. The two owners of this mine recently divided $10,200 as the profit from two months' work with a force of 35 men. At the North American drift mine about 70 men are employed. Thirty of that number are taking out gravel. Until recently the whole force has been on dead work, such as running ahead tunnels and gangways. The mine is now in shape to take out gravel on a big scale and large returns may be looked for soon.

Siskiyou.

NOTES.—Yreka *Journal*, July 11: Siskiyou mountains are swarming with Chinamen in the vicinity of the tunnels and their approaches. The mining companies on Klamath river are full of business just now in sinking down large cuts to bed rock, with expectation of soon taking out an abundance of ore.

Trinity.

WEAVER BASIN.—*Journal*, July 21: Miners in Weaver basin are all done cleaning-up and say their claims paid as well as usual, considering the limited water supply. They will at once commence fixing up and get everything in good shape as all expect a big season next time.

EASTMAN GULCH.—The *Journal* says of a recent quartz discovery by "Uncle Jim" Blakemore, near Eastman gulch on the Trinity river: "It turns out much better than had been anticipated. Sixteen and one half tons of the rock ground in the arrastra produced $2,500, or at the rate of $150 to the ton, and the rock which they are now running is variously estimated at from $200 to $400 to the ton. The lode has well defined walls and widens and improves as they go down and in on it. Under these conditions it is not surprising that the Blakemores last week refused $50,000 for their mine, the offer being made by a justly celebrated quartz mining expert from San Francisco.

TRINITY MINES.—Oroville *Mercury*, July 20: Many of the miners have already cleaned up for the season. As nearly as can be learned at present, the gold yield will fall considerably short of what is con-

sidered an average season, but this is attributable to the exceeding dryness of last winter. For the quantity of gravel washed the yield is considered excellent.

NEVADA.

Washoe District.

MEXICAN.—*Enterprise*, July 21: On the 3100 level the main north drift is being pushed ahead rapidly to reach the line of the Union Con. and Sierra Nevada, where it will connect with the winze down from the 3000 level. The first part of next week sinking will be resumed in the joint Union Con. and Sierra winze below the 3000 level. The upraise from the 2900 level is being pushed to connect with the winze down from the 2700 level. From the 1900 down to the 2300 level the winzes joint with the Union Con. are being repaired.

UNION CON.: Are easing timbers in the joint Sierra Nevada drift on the 2500 level; also, doing the same work in the east drift on the 2700. The joint west crosscut on the 3000 level has penetrated the vein recently a distance of 40 ft. The face is all in material rich in gely composed of low grade quartz. Are repairing the joint Mexican winzes from the 1900 to the 2300 level.

SIERRA NEVADA: On the 3000 level the joint Union Con. west crosscut is cut 130 ft from the winze. It had yesterday been advanced into the vein recently cut a distance of 40 ft. North lateral drift No. 1, on the 2600 level, is being pushed ahead at the rate of about 20 ft per week.

OTHER: The repairs to the Central tunnel are progressing favorably, and the old Mexican shaft is fast being put in good order. The work of repairing the main incline track and putting in new ladders will soon be completed. The usual amount of ore is being extracted from the croppings.

HALE AND NORCROSS: It was expected yesterday afternoon that the connection would be made between the 2400 and 2600 levels in an hour or two.

ALTA: A drain is being made in the drift connecting with the Sutro tunnel, a pump tank is being constructed at the 1030 level, and all is being put in order for pumping out the lower levels.

BEST AND BELCHER: The joint Gould and Curry east drift on the 2500 level is in a soft vein material, containing frequent streaks of quartz and clay. The northwest drift on the same level is making about 30 ft per week.

GOULD AND CURRY: The joint Best and Belcher east drift on the 2500 level was advanced over 30 ft during the week.

UTAH: The drift from the upraise is completed, and the pipes for carrying the water to the Sutro tunnel are being put in.

CALIFORNIA: The tank station at the 2800 level in the C. and C. winze is nearly completed. On the 2900 level the south drift is progressing at the rate of about 25 ft per week.

ANDES: The west drift is being advanced at the rate of about 10 ft per week. The winze is in low grade ore and quartz of a fine appearance.

YELLOW JACKET: The yield of 150 tons per day is kept up, and at the same time a good deal of exploring work is being carried on at various points.

CON. VIRGINIA: The tank station in the C. and C. winze at the 2800 level is about completed.

SAVAGE: Prospecting will soon be commenced on the 2600 level, where there is a large amount of ground ready for crosscutting.

BELCHER: A considerable amount of low grade ore is being extracted and sent to the mills.

Belmont District.

WILLOW CREEK.—Winnemucca *Silver State*, July 21: B. H. Luther, who visited the Willow Creek mines a few days ago, says there is considerable prospecting going on in the camp. The Choate boys are sinking on their ledge and have a very fine prospect. The Penobscot Boy, owned by McPhetres & Co., appears to be the largest gold-bearing quartz vein ever found on the coast. Cuts have been run across the lead on the surface in several places, and free gold in paying quantities is found everywhere. The lead runs through a smooth, grass covered hill, and the open cuts are run through grass a foot high, the quartz being from three to six feet below the surface.

BELMONT ORES.—The *Courier* says: The Belmont Mining Company's mill was running last week for the purpose of ascertaining which of the two processes, "amalgamating" or "leaching" is the best and cheapest, and following is the result of the test: By the amalgamating process, bullion produced, 847 ounces; 441 fine; assay value, $477.27. By the leaching process, bullion produced, 530 ounces; 925 fine; assay value, $633.88.

Columbus District.

NORTHERN BELLE.—*True Fissure*, July 21: The southwest drift on the fifth shaft level has been extended 9 feet during the week; the total length run is 159 feet. The formation has changed very materially, the face of the drift looking very favorable for encountering ore. In the crosscut to the south, on the same level, there has been no work done. The stopes on the fourth shaft level are yielding as usual. The stopes look well in the upraise above the first shaft level, and are showing an improvement. The section of the mine above the adit levels presents very much the same appearance as last week, except the seventh level, where the ore improves as the work on it progresses upward. Some fair grade ore is being taken from the ninth level, also from the winze from the eleventh. The daily yield of ore has been about 53 tons, which is being shipped to the mill. Both mills are running steadily and doing good work. The bullion shipments have been $12,550.23 for the week ending July 19th, and aggregate $37,076.70 on July account to the same date.

MOUNT DIABLO.—The stope below the third level, near winze No. 1, is yielding a small amount of $50 ore. The stope west of winze No. 2 is not looking so well, but is turning out considerable $50 ore. The stope below the third level, near the head of winze No. 2 is showing some two feet of ore assaying $75 per ton. The stope above the third level near the same winze, does not show anything of value. A number of car loads of $150 ore have been taken from a bunch below the third level, near winze No. 4, during the week. A crosscut has been run 30 feet north from the winze between the second and third levels. It is nearly north from the shaft, and has cut a ledge of $60 quartz that looks promising. The intermediate stope, between the second and third levels, nearly above winze No. 1, is giving a small amount of rich chloride, and a crosscut has been run some 40 feet to the north from the second level above this stope. It has cut the ledge, which is a narrow streak of $200 ore, at this point. The stope above the west drift from the Callison winze is not looking so well in the center, the ledge being narrower. The east end shows rather a stronger ledge. A great deal of $100 ore is being extracted from this stope. A shipment of bullion valued at $7,633 was made on the 12th instant, and another of $9,484.71 on the 16th.

BORAX.—G. L. Turner & Co. have commenced the manufacture of borax, meeting encouraging success, the first tank yielding 800 pounds of fine borax. The company has 120 acres of land, and expects to produce about ten tons of borax per month, worth about $1,600. Goodwin & Roach are erecting six tanks, and intend to add six more as soon as practicable. They have 400 acres of ground and will manufacture a ton a day when the twelve tanks are in running order. Mr. Roach has had great experience in the business, having been in charge of the works at Teal's marsh for several years. Schwartz & Mohni are working a large pile of tailings, originally from Teal's marsh, and are attaining satisfactory results. These tailings were worked some ten years ago, being hauled some fifteen miles for that purpose. Marrotte & Co. are also about to erect works on their claim of some 200 acres. Other parties have located ground and will probably erect tanks and boilers.

DAYTON. *Times*.—Garfield and Santa Fe contain some of the best mines in the State, some of those in Garfield having paid their way from the surface. Farther south, along the White mountains, are large mineral belts containing innumerable ledges, from which poor but energetic miners can make good profit from their labor. Sampling mills will soon be built at two, and perhaps three points, and a great deal of money will come from the districts within reasonable reaching distance. Since it has become easier for the prospector to get supplies, new districts are being made, which will soon add their valuable output to the wealth and industry of this section. In Deep Spring Valley, within a short time, developments have been made which leave no doubt as to the great value of the district. Darwin, Cerro Gordo and Beveridge, formerly noted districts, are again becoming centers of industry and are receiving much attention from Arizona mining men. This is a country of old time miners, who knowing the value of their property have staid for years, sometimes in distress, and nearly always in straightened circumstances. They are now to be rewarded for their faith and patience, as facilities for transportation and cheaper methods of working rock will permit them to derive an income from what has been heretofore almost dead property.

Pioche District.

MEADOW VALLEY.—*Record*, July 14: The two men working on the tunnel level have sunk on the ledge some 10 ft and extracted ore along it for a distance of 20 ft. The ore continues improving, that being extracted will pulp $75 per ton. It is likely that at no distant day the company will have a good force of men working on the old ledge that was abandoned in early days owing to the low grade of the ore. The mills have all run out of salt, and there is none to be had in this vicinity at present. The mill at the lower end of town has been closed down for want of the article. There is a wagon train loaded with salt on the road, which is due, and liable to arrive at any moment.

KINGFISHER.—At every blow of the pick this mine in Jackrabbit district, improves. The dead work having been done, the miners are engaged sinking the shaft. In the ledge a three-ft vein of dark-red ore was encountered the first of the week, and looks like free milling ore. It assays $96.25 in silver. The Kingfisher presents one of the finest prospects in southern Nevada. The ground is exceedingly favorable for the opening of a big mine at any moment.

DAY MINE.—The work of developing the ore bodies in the lower workings of this mine is being pushed ahead as rapidly as circumstances will permit. The ore chambers look very favorable as far as penetrated and create great hopes in the minds of all who have seen them.

AT BULLIONVILLE.—The concentrating tables were started here running on the night of the 7th inst. They have been placed in excellent order and are doing good work. The average yield per day of the mill working tailings is about $140, much better than was expected. There were two bars cast at the mill on Sunday, and another 90-pound bar yesterday. As soon as the smelting company have completed working the old tailings they will be enabled to rework the tailings that have already been run through by a new process. So they believe.

ARIZONA.

ABOUT PINAL CITY.—Pinal *Drill*, July 14: On the Nacoochia, they are timbering the shaft preparatory to sinking. The South Pioneer has 7 ft of pay ore in the north drift, 300 level. Twenty-one men at work in the mine. The mill is run steadily. Santos Corona is building and adobe smelting furnace and refinery in connection with the Queen creek water jacket. The late rains have caused a plentiful supply of water and a few days now will suffice to start the Queen creek smelter. The Hastings Co. are working a force of men. The Surpriser is under the management of J. H. McMullen. The Eureka mine is constantly improving. The walls are prominent. The hanging wall is very smooth, the foot wall coarse. The supply of ore is increasing and more than the mill can consume. It shows large quantities of horn silver. Sinking and drifting on the Monarch of the sea. At the bottom of the shaft, ore assaying $5,300 has been found. They have now 20 men employed and are preparing for operations on a grand scale. The owners have worked cautiously hitherto and the present increase is a good sign. Rain has fallen in many parts of the Territory, the fall in most places has as yet been light, 75 tons of bullion were lately shipped by ox teams from the Howell reduction works to the A. & P. railroad. These works are on Lynx creek, about 12 miles southeast of Prescott. One hundred men are employed in the underground workings of the Silver King mine. Old Dominion shipped for the week, 71 bars—22,840 pounds. Total, 3,588,275 pounds. On hand and waiting shipment, 318 tons. At Pine Springs, Gavin & Co. have a large lot of horn silver sacked ready for shipment, and up to date the mine holds its richness and has widened. It the north drift horn silver 88% pure has recently been taken out. The Globe Silver Belt has 7 ft of pay ore in the north drift on the 300 level. There are 21 men at work in the mine. The mill is working steadily. The Callen mill at Walnut Grove is running on full time and bullion is streaming out.

PRESCOTT. *Courier*, July 3: The Black Warrior mill continues to work out silver bullion. The Peck hoisting works are up. J. N. Rodenburg exhibits very rich silver ore just received from Turkey creek district. It was sent him by B. T. Shaw, who took it from an extension of the Pine Spring mine. The Pine Spring mine, owned by Messrs. Gavin, Roberts and Morgan, continues to yield very much rich ore. Joe Taylor, just from the Silver Belt mine, says that never before has it been in as healthy a condition. C. T. Lewis tells us that the Castle creek smelter will be running in a short time. Geo. Monroe has discovered a big thing in lead, near Wickenburg. The Howell reduction works are going. The company will shortly ship upwards of 70 tons of bullion. Boxes of ores are every day going forward to Denver and Santa Fe.

NOTES. Prescott *Courier*, July 20: Gentlemen just from the Belle mine belonging to the Howell Co., tell us that ore is being raised from a depth of 325 ft and that the mine is in fine condition. Guilford Hathaway tells us that a shipment of 35,000 pounds of bullion was made from the Howell smelter two days ago. The mill will soon be up and running.

HACKBERRY.—Mineral Park *Miner*, July 15: There are thirty-seven men employed in the Hackberry mine at present, besides seventeen in the mill. Fred. Nobman is sinking for water, in order to have enough to keep the mill running. The mine is looking well everywhere, and is being opened up in every direction under the management of F. N. Johnson. The report that M. Abernethy was about to resign his position as superintendent of the Indian Queen company is untrue. I. J. Sands is working in the mill.

EL DORADO CANYON.—The Southwestern mining company have a fifteen-stamp mill, dry crushing, with cylinder roaster attached. This mill was kept running last year for eight months on ore from the Savage and Techateiomp mines, which belong to the company. These mines have produced some half million dollars in bullion since being located. The mill was started up in April of this year, and has been running regularly ever since. The five-stamp mill belonging to the Lincoln silver mining company at the Canyon, has been running on custom ore, with good results. The Southwestern mining company have about forty men employed at present. Many miners are at work about El Dorado Canyon on their own mines, and many others chloriding on the mines owned by Gillispie, Lund & Co. The intense heat of summer prevents many mines being worked at the Canyon at this season, but none of them remain idle during the winter.

COLORADO.

IDAHO SPRINGS.—*Gazette*, July 14: Some of the finest mineral land in the State is open to projectors in Ute and Cascade creeks. Solid silver glance weighing as much as three ounces is being found in float at the head of Cascade gulch, and quartz carrying sulphurets of silver that will assay $900 can be picked up at the head of Ute creek. The finest timber in the State is here to be seen and the water is as pure as any in the world. Work is being vigorously pushed on the Silver Link lode near the entrance of Ute creek. The mineral contains galena, gray copper, and rosin zinc, and very much resembles the ore of the Eclipse mine. Prospectors are arriving daily at Bullion Camp from all quarters. Work is progressing finely on the Treasurer and Twin lodes on Ute creek. Elliott's placer claim is being successfully worked on Chicago creek. Three men are being worked on Treasury Vault lode, Cascade gulch. A large body of ore has been struck in the Silver King mine, Cascade mining district. Work will commence on Denmark lode, Bullion camp immediately. The Kitty Clyde mine presents a handsome appearance with its many new improvements. The plant of machinery for this mine was successfully taken in on Monday last. Ten and a half tons of second and third class ore were shipped to Black Hawk from the Silver Glance mine on Saturday last. Mr. Fallon is working his Royal Oak group of mines on Ute creek, and obtaining a very fine grade of mineral. Mr. Finch manager of the Wallace mine in Bullion camp, is working that property day and night. A good graded road is nearly completed from the mine to the Spring gulch road. Work is steadily being proceeded with on the Golden Eagle lode at the head of Maxmillian gulch. The vein is six ft between walls, and carries a pay streak of 10 inches mineralized quartz on the hanging wall that mills two ounces gold and ten ounces silver per ton.

IDAHO.

SMOKY MINING ITEMS.—Ketchum *Keystone*, July 21: The placer mines of Little Smoky are being worked to advantage, and a wagon road is being constructed to them from Camas Prairie.

THE FOURTH OF JULY.—One of the first discoveries in the Smoky country, shows large quantities of high grade ore and bids fair to develop into a rich mine.

THE ALTURAS. Is being opened up by Messrs. Whitmer & Dithmer. It is a well defined ledge, and carries, in addition to good galena, some specimens of gray copper.

THE CLIMAX.—It is being worked by a lively crew, and report says is the scene of a recent big strike, a large body of galena having been disclosed, and now considerable ore is being extracted.

THE CARRIE LEONARD.—This mine has shipped upwards of 60 tons of 180 ounce ore, but, until a wagon road is constructed to the mine or reduction works established on the Smoky it is nonsense to take out the ore from the drifts.

ABOUT KETCHUM.—It is estimated that the timber on the mountains about Ketchum is sufficient to supply the Wood river country for 25 years to come, and the supply on all tributaries to the upper Wood river is exhaustless. Some beautiful specimens of float galena ore brought in by Trail creek prospectors and the discovered ledges in that locality show flattering indications. It is rumored that an immense galena discovery has recently been made on the East Fork of the Salmon. It is said that the lucky strike consists of 15 ft square, as far as uncovered, of solid galena.

LIVELY AT ALANTA.—Atlanta is enjoying quite a boom in a small way. There are probably 200 men at work in town and in the immediate vicinity, two mills of 20 stamps each are going up and a good deal of building is going on. The Monarch mine is showing up splendidly. From the surface to the 200 level this mine yielded $1,400,000 of first-class ore, 1,000 tons of which sold in Omaha for $1,000 per ton. At present, in addition to the low grade ore reserves in the upper levels, there is a large body of ore in the lower levels.

BIG MINE.—Hailey *Times*, July 14: A ledge near Vienna, over which a trail has been traveled three years without anything being found until recently, has developed into a bonanza. Mr. Childs, having noticed the ore on the surface, which by everyone else was regarded as float, took a careful look at it and found it to be ore in place, and set a gang of miners at work upon it. A few days since there was opened up here a lode 35 ft across, all ore assaying into the hundreds. This is the biggest ore showing on the surface found anywhere since the Custer mine was discovered.

MONTANA.

THE LEXINGTON. Butte *Inter-Mountain*, July 18. The affairs of the Lexington Co. continue in the same satisfactory condition that has characterized them since the present management took hold of the enterprise. An inquiry as to the workings of the mine and the outlook of the property was met by a courteous invitation from Manager Medhurst to let the product of the mine for the past six months speak. In compliance with his suggestion the *Inter-Mountain* is enabled to state that on July 1st a dividend of 1,100,000 francs was paid in Paris to the stockholders. The product of this property from January 1st to July 1st, 1883, was $638,548; which would betoken that the Lexington Co. have a valuable hole in the ground, and that Butte is not quite dead yet. Two salt batteries of five stamps each have been erected in the mill, one of which was started up a few days ago, and the other will be set in motion probably before the end of the week. R. W. Noble brought 96 ounces of gold into Virginia City last week, the product of a run of ore from a mine on Wisconsin creek in which he is interested. Placer diggings have been discovered with in a short distance of Billings and several claims are already located. It is said to be pay dirt. About 10 tons of ore per day are now taken out of Clark's fraction by only six men. Assays of the rock show it to carry between 60 and 70 ounces of silver.

NEW MEXICO.

KINGSTON. *Tribune*, July 12th: The two smelters at Copper City will blow in soon. All the White Oaks mines are reported as producing finely. The rich ore in the Bear mountain mines still holds out. The Old Man mine, Bear mountain, has been surveyed for a patent. The Southwestern M. Co., of Topeka, will erect machinery at their mines near Chloride. The Myrtle mine, Central City district, is looking exceedingly well for the amount of work done. The Cariboo mine at Fleming is now developed by an 80-ft shaft and is producing high grade ore. The ore produced by the Silver Bear mine, Mogollon mountains, is becoming richer as depth is attained. Two hundred sacks of ore weighing 10 tons have been shipped from the Silver Monument mine, near Chloride, to the Argo works at Denver. A five ft breast of rich ore has been struck in the Last Chance mine at Pyramid. This mine makes a regular shipment of a carload of ore per day. The mines of the Sandias are reported showing up splendidly. The Bullion mine at Kingston is looking better than ever and high grade silver ore is being extracted. It is reported that a force of of 20 men are at work, night and day, on the Little Mac mine, White Oaks district, and are taking out a large amount of high grade ore. The work of surveying the Buffom mine, Chloride district, for a patent, was completed last week, and work has been resumed in the shaft. The opening is now 227 ft deep, and is nicely timbered from top to bottom. The vein shows an ore streak of solid metal that runs $225 in silver and $50 in copper.

OREGON.

COPPER KING.—*Oregonian*, July 20: The Copper King copper mine of Baker county, is to be developed by Captain Hoatsen, late of the Lake Superior mines. He has gone over the claims and reports them of great value providing the veins run true. Lake Superior mining parties agree to pay $100,000 for a fifth interest in case the mines promise as well on later investigation.

ELLENSBURG.—*Localizer*: We saw a nice sample of what is said to be genuine anthracite coal. Upon inquiring we learned that the discovery was made by Wm. Packwood; that it is located on the west slope of the Cascade mountains in the Packwood pass, and that it is 18 to 23 ft wide and many acres in extent. We believe this is the first discovery of that particular kind of coal in the Territory.

UTAH.

PARK CITY.—Salt Lake *Tribune*, July 20: A piece of galena and carbonate ore weighing 400 lbs. has been taken from one of the mines at this place. In Thayne's canyon, there is unusual activity in building improvements and prospecting. The Council Bluffs Company, is now engaged in getting out timber for a boarding house, and from present indications the company is liable to continue work on their mines through the winter.

COPPER GULCH.—J. M. Burke and others are developing the Creedmoor, Magnolia and Gallanipper, near Frisco. Sixteen men are employed, one-half being on the Creedmoor. In this property a good vein of ore was struck, which, in places, is six feet wide, the ore going 60 per cent lead, and 20 ounces silver. At present the head of the drift is in a fault or barren ground, but it is hoped soon to find the body of ore. Frisco is a very quiet town just now, while matters at Copper Gulch are more lively. The Cactus Company made a test run yesterday of their concentrators, which promises to prove successful. The Cactus has an immense ore body, and if this can be concentrated and worked cheaply, Copper Gulch will soon become a lively camp. A large force of men are employed putting up boarding houses and other buildings around the Cactus and Comet mines.

TABLE OF CONTENTS.

EDITORIALS.—Treating Gold-Bearing Clays; Mining Improvements; Prevention of Mining Accidents, 50. Passing Events; End Lines of Mining Claims; Ores of Nickel; Locating too Much Surface Ground; Blowpipe Lead Assays, 57. Blasting in Mines—No. 1; Foundry Notes; Pacific Coast Inventions, 58.
ILLUSTRATIONS.—Combined Cradle and Puddling Machine for Auriferous Clays, 50. Different Methods of Boring for Blasts, 58.
CORRESPONDENCE.—Letter from New Mexico, 50.
MECHANICAL PROGRESS.—The Needed Bran Compressor; How Screws are Threaded; Nails in the Days of our Grandfathers; American vs. English Nails; Spiegeleisen; Steel Nails; Locomotives from Europe; Rolling Liquid Iron, 51.
SCIENTIFIC PROGRESS.—Science and Progress; A Submarine Observatory; Wine Ferments; The Storage Battery; What is Carbon; Human Hair Under the Microscope; Photographic Speech, 51.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 52.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 52-3.
THE ENGINEER.—The "Bared Right Arm;" Progress of the Telegraph, 55.
USEFUL INFORMATION.—Important Experiment; To Keep Tires on Wheels; Storing Grain; Decay of Stone; For Polishing Brass Instruments; The Compounds of Gold; Bessemer Steel; To Render Musty Grain Sweet, 55.
GOOD HEALTH.—Very Hot Water for Consumption; The Electric Light on the Eyes; A Singular Case of Bleeding, 55.
NEWS IN BRIEF—On page 60 and other pages.
MISCELLANEOUS.—The Boss Copper Smelters; Our Local Industries; Carelessness in Mining and Assorting Ores, 50. Electric Light for the Southern Exposition Building; A New Use for Mica; Boom Towns in Montana; Inspecting and Marking the Boundary Lines; Too Many Claims and too Little Work, 54.

BUSINESS ANNOUNCEMENTS.

Globe Iron Works—John Caine, Stockton, Cal.

Passing Events.

The mining situation in different parts of the country seems to be very favorable, judging from the reports in the local press. In nearly all sections developments are being pushed ahead with confidence. Prospectors are busy at their summer's work, and though we have heard of no wonderful strikes this season, or the establishment of new and important districts, yet many new mines have been found.

We note elsewhere the preparations for the establishment at the local rolling mills of extensive steel works, which is an important industrial advance on this coast.

The telegraphers' strike is the topic of the town, and thus far it still continues.

Extensive preparations are being made throughout the city for the reception of many visitors to the Triennial Conclave next month. It may be that some of these visitors will take more or less interest in our mining industry, and visit our mining regions.

LEADVILLE has now six smelters, whose combined capacity is 775 tons of ore a day. It has also two stamp mills of a capacity of 80 stamps. Over 800 tons of ore per day are thus used in Leadville, while about 450 tons are shipped to other points. The total output for the year 1882 of the Leadville district was $17,181,853, and it is expected that the yield of the present year will be still greater.

THE Lake Superior (Mich) mines report a product of 2,648 tons copper for June.

End Lines of Mining Claims.

No more perplexing questions ever arise in mining litigation than those connected with "end lines." Section 2320 of the Revised Statutes provides that "end lines of each claim shall be parallel to each other." This seems a very simple proposition, yet many unforseen difficulties have arisen, which would occupy too much space to detail, but to which we have before referred, as the circumstances arose. Now, however, comes the Secretary of the Interior, and declares that the statutory direction that the end lines of a lode claim must be parallel, should be followed, as a rule, *but*, under certain peculiar circumstances, an exception to the rule may be allowed. If this ruling had been in existence some time since it would have saved endless trouble.

Some consideration of this subject will be of interest to all miners. It will be remembered in the case in the United States Circuit Court, District of Nevada, of the Eureka Consolidated Mining Co. vs. the Richmond Mining Co., objection was made to the validity of certain patents, because of non-compliance with the provision aforesaid. It was, however, held that "the provision of the statute of 1872 (incorporated into Sec. 2320 aforesaid), requiring the lines of each claim to be parallel to each other, is merely directory, and no consequence is attached to a deviation from its direction."

It was further held that "the defect alleged did not concern the defendant, and no one but the Government had a right to complain."

In reviewing the case, on appeal to the Supreme Court, the question as to whether the statute was directory only, does not seem to have been specially considered. The patents were, however, construed; and the court said: "Upon the face of the patents the United States has granted to the Eureka the right to all veins, lodes, and deposits, the tops or apexes of which lie on the inside of its surveys as patented, throughout their entire depth, and wherever they may go, provided it keeps itself within the end lines of the survey. The finding that the ground in dispute is within the end lines, and that the apex is within the surface lines settles the rights of parties between themselves as well under their patents as under their compromise agreement."

The case which brought forward the ruling of the Secretary of the Interior to which we are referring was one arising in New Mexico. It seems the Commissioner of the General Land Office directed the Surveyor-General of that Territory to amend a survey of a mining claim because "the broken and parallel end lines of the claims aforesaid do not afford a substantial compliance with the law." The matter was brought before the Secretary of the Interior, who made the ruling referred to.

It should be stated why the Secretary made an exception in this case. Although in the case of the Eureka Consolidated vs. the Richmond Consolidated mining companies the statute was held by the Circuit court to be directory only, and the ruling was not disaffirmed on appeal, the Secretary thinks that the statutory question should, as a rule, be followed; and he approves fully of the Land Commissioner's practice of requiring surveys to conform to the direction. The reasons he gives for making the exception in this instance are as follows:

There are no conflicting interests, and the question is one between the claimants and the government.

The facts show that the claims are located in a section of the country subject to Indian depredations. Two surveys have already been made, at great expense and under great difficulties, guards being required to protect the surveyors from hostile Indians. The last survey has been approved by the Surveyor General, and it seems to be correct in all respects except as to the broken parallel end lines. It is also reported that the peculiar topography of the country required these variations to enable a proper survey of the claim to be made. A further survey would now be attended with even greater expense and more hazard, on account of the renewed violence of the unfriendly Indians.

The interests of the claimant, who has already been put to large expense, and who seems to have acted in the utmost good faith, seem to require speedy action in order to protect him from loss.

Under these peculiar circumstances, the Secretary of the Interior directed the Commissioner of the General Land Office to approve the survey submitted, notwithstanding the fact that the end lines were not shown to be parallel.

Ores of Nickel.

Of the ores of nickel, the most important and those from which the nickel of commerce is is largely obtained, are kupfernickel and nickel speiss, while the other more important of its ores are nickeliferous pyrites, nickel glance, arsenical nickel, etc. The ores of nickel occur in most parts of the world where other metalliferous deposits exist in more or less small quantities, but the most abundant supplies are found chiefly in Norway, Sweden, Hungary and South America.

Kupfernickel—false copper or copper nickel—is an arsenide of nickel constituting the principal ore of the metal. It occurs as a copper-red, opaque, brittle body, sometimes crystallized in hexagonal forms; at others, in massive reniform, columnar or arborescent forms. Its specific gravity varies between 7.3 and 7.5, and its hardness is 5.5. Its streak is pale brownish red; it exhibits a metallic luster, and exhibits a gray or blackish color when tarnished.

Analyses of this mineral show it to contain from 35 to 45 per cent of nickel, the residue being chiefly arsenic, with only small proportions of sulphur, iron, etc., but occasionally antimony is present in not inconsiderable amount. This mineral occurs in Bohemia, Thuringia, Hesse, Styria, Saxony, Norway, Westphalia, Hungary, France, Cornwall, Connecticut, etc., usually associated with ores of cobalt, copper or silver; and occurring in gneiss, mica slate, clay slate, quartz, syenite, etc. Other arsenides of nickel occurring native are Cloanthite, Rammelsbergite, etc.

Nickeliferous pyrites, or capillary pyrites, is a native sulphide of nickel, which occurs in a brassy yellow, brittle, opaque solid, having a metallic luster, with a hardness of from 3 to 3.5, and often occurring in rhombohedral crystals, although most frequently occurring in strings or threads, along with other minerals. It is found in Bohemia, Przibram, Andresberg, Cornwall, and in Pennsylvania.

Nickel glance is a silver white or steel gray brittle mineral with a metallic luster, a grayish black streak, and a hardness of 5 to 5.5. It occurs massive, or crystalized, in monometric or cubic forms. It varies much in composition, but contains usually from twenty-five to thirty per cent of nickel, with from forty to forty-five per cent of arsenic, and from fifteen to twenty per cent of sulphur, while other varieties contain from forty to fifty per cent of antimony, and smaller proportions of arsenic. It occurs in Sweden, Westphalia, Thuringia, Hartz, Styria, Hungary, etc. Amongst other minerals containing nickel in large proportion may be noted millerite, a native nickelous sulphide; emerald nickel, a native nickelous hydrocarbonate; annabergite, or nickel bloom, is an arseniate of nickel.

Locating too Much Surface Ground.

When a man locates a lode mining claim under the United States mining laws, he is allowed to take up 1,500 feet along the vein and 300 feet on each side. His location is, therefore, 1,500 by 300 feet. To this he is entitled. A man may take up more on each side than he is entitled to, by mistake, or mismeasurement, but he cannot hold it if the mistake is discovered, and others may lawfully locate the excess as side-ground to other lodes. A ruling has just been made by the Secretary of the Interior to the effect that the taking up of more width of surface ground for a mining claim than is allowed by law does not invalidate the location, and the monument stakes may be moved to cast off the excess.

This was in the case of a mine in Tombstone, Arizona, where one of the objections raised to granting the patent was that the original location was found by the examination preliminary to survey on the ground to be more than 600 feet in width, and the claim was so reduced as to cast off the excess.

The Secretary says: "It can scarcely be seriously urged that such a correction of lines to bring them within legal restrictions should be held to invalidate the original location, any more than a settlement claim of pre-emption could be held invalid because by mistake the settler at the first had mistakenly embraced in his filing a larger area than 160 acres. The rule has always prevailed to the effect that he may reduce his claim by proper amendment to include the legal area. So, also, of homestead entries"

Blowpipe Lead Assay.

Lead is extracted from its matrix by fusing the finely powdered mineral with metallic iron and a fluxing and reducing agent in a small crucible placed in the charcoal melting furnace. The earthy matters and non-reducible oxides and sulphides are slagged off, and a button of metallic lead will be formed in the bottom of the crucible. The assay of lead by fire is always attended with a heavy loss, as lead volatilizes readily when strongly heated, and portions are also liable to be carried off in the slag.

Fire assays of lead ores, when compared with the results obtained by humid analysis, generally show a loss varying from five to twelve per cent. The fire assay, however, represents what is produced by smelting lead ores on a large scale, and it is therefore of great commercial use. For the class containing galena, and all lead ores containing either arsenic, phosphorus or sulphur, Mr. George Attwood, in his "Practical Blowpipe Assaying," gives the following simple method of assay:

Take of the finely crushed ore two grains, and mix with three grains of dry carbonate of soda, 0.5 grains of borax glass, 0.5 grains powdered charcoal, and one grain cyanide of potassium. In a small fire clay crucible place two small pieces of wrought iron, about the thickness and length of a small steel pen, and then pour in the assay: cover the assay with about four grains of common salt but allow the ends of the iron pieces to project above the assay charge; put on the cover of the charcoal furnace, (blowpipe described recently in the PRESS) and screw the tightening-pin; apply a reducing flame through the opening made in the furnace, but apply it first in a downward direction, so that the flame does not attack the bottom of the crucible. After a few minutes blowing the assay commences to boil, and the furnace will be found to be at a good red heat. Do not increase the heat until, by a glance through the hole in the top of the furnace, the assay is found to be thoroughly fused; then increase the heat, and with a pair of iron pliers extract the pieces of iron, one by one, whilst the assay is in a thorough state of fusion. After the iron has been taken away, allow the assay to cool slowly.

When cool, break the crucible between two pieces of paper on the steel anvil, and clean the lead button and weigh; examine the slag with a lens, and if any globules of lead are found add them to the larger button. If numerous small globules are found in the slag the assay should be repeated. This assay only takes about eight minutes, and if carefully made it will agree closely with fire assays made on a large scale. The lead button frequently contains a large amount of copper. This can be ascertained by dissolving the lead with boracic acid in a deep bore on charcoal and deducting the weight of the copper found from that already considered to be lead. Lead nearly always contains silver, and also gold, therefore the button should be tested for both these substances.

There is another class which comprises all ores of lead and plumbiferous substances which are free from sulphur and arsenic, or contain only traces of the latter. Litharge, carbonate of lead and minium are the chief substances which come under this class. To assay ores of this class, mix the finely powdered material with four grains of carbonate of soda and one grain of argol, and 0.5 grams of borax glass. Place the mixture in a small crucible, and after covering with three to four pounds of common salt, fuse and treat in a similar manner to ores of the class before described.

IN the old Del Monte workings at Aurora, Esmeralda county, Nev., at a depth of 100 feet, two deserted tunnels intersect, and a strong draft, meeting at the said point of intersection, lowers the temperature beyond the freezing point. There is quite a seepage of water from the upper workings, and as fast as it drops through, at all seasons of the year, ice forms.

A. T. DEWEY, of this office, has recently returned, with his family, to Oakland, after a much enjoyed recreation trip of four weeks in Sonoma, Lake and Napa counties. Friends met by them will please accept grateful thanks for many kind favors extended.

WOOD RIVER and Salmon river continue their favorable reports, and Butte speaks for itself in its immense weekly output of ore and bullion.

Blasting in Mines—No. 1.

In blasting, the exigencies of machine labor render it impracticable to follow closely the principles which lead to economy of labor material. In hand boring, economy is gained by reducing to a minimum the number of holes and the quantity of the explosive substance required. But in machine boring, economy is to be sought mainly in the reduction of the time needed to accomplish the driving. Attempts have been made to assimilate the methods of machine boring to those adopted for hand labor, but the results have not been satisfactory. On the contrary, the conditions determining the position and the direction of the holes relatively to the production of the greatest useful effect have been wholly ignored in favor of those which determine the most rapid boring. This system has been attended with more satisfactory results. Another system, partaking of both the preceding, is widely adopted, and hitherto the best results have been obtained from this, which may be regarded as a compromise between conflicting conditions. Thus we have three systems of executing machine boring; one in which a single machine is used upon a support capable of holding it in any position, so as to be able to bore at any angle, and in which the holes are placed according to the lines of least resistance, as in hand boring. A second, in which several machines are fixed upon a heavy support, allowing but little lateral or angular motion, and in which the holes are placed at regular intervals apart, and bored parallel, or nearly parallel, with the axis of the excavation, irrespective of the varying nature of the rock, and the lines of least resistance. And a third, in which it is sought, by the employment of one, two, or at most three machines, upon a simple and light support allowing the position and direction of the machine to be readily changed, to satisfy, in some degree, the two sets of conditions determining the two former systems, by placing the shot holes as far in accordance with the lines of least resistance as the exigencies of a fairly rapid handling of the machine will allow.

In executing the boring, it is very necessary to keep the holes free from debris. Bits must be chosen to suit the rock and the hole kept well supplied with water. The absolute number of holes required in any case will, of course, depend upon the tenacity of the rock and the development of the jointing planes, and also, in some degree, by the lines of fracture due to the preceding blast. The same circumstances will determine the distribution of the holes. Leaving minor variations out of account, however, the same distribution will be adhered to throughout the driving. The manner of distributing the holes over the face of the heading may be varied according to the judgment of the engineer in charge; that is, the general features of the distribution to be adopted, may be chosen to suit the requirements of the machines and their supports. Also, it should be noted that one method of distributing the shot-holes will require a less number of them than another. Some samples are shown in the engravings, which are from "Andre's Coal Mining." Fig. 1 represents the heading of the Mt. Cenis tunnel. Fig. 2, the Goschenen end of the St. Gothard tunnel. Fig. 3, the Airolo end of the same tunnel. Fig. 4 represents the face of a stone drift driven at Marihaye. Fig. 5, a similar drift at Anzin, and Fig. 6 a drift of the same character at Ronchamp, the latter three examples being typical of the distribution adopted in the French collieries.

DIFFERENT METHODS OF BORING FOR BLASTS.

THE LEACHING PROCESS WINS.—The Belmont *Courier* says: "The Belmont Mining Company's mill was running last week for the purpose of ascertaining which of the two processes, namely, "amalgamating" or "leaching," is the best and cheapest. Following is the result of the test: By the amalgamating process—bullion produced, 837 ounces; 441 fine; assay value, $477.25. By the leaching process—bullion produced, 530 ounces; 925 fine; assay value, $633.88. The conclusion is, therefore, arrived at that the leaching plan is the best. In the adoption of this method we seem in fact to be to some extent working back along the line of the Creator's movement."

Foundry Notes.

Some very important improvements are shortly to be made at the Pacific Rolling Mills, by which they will be able hereafter to make their own steel. Mr. Noble, the Superintendent, has recently returned from the East, where he has been studying up the subject of the Siemens-Martin process for the manufacture of steel. A complete plant of a capacity of thirty tons per day will soon be put up, and preparations are now being made for this addition to the mill. Most of the machinery will be made here, though some of it will come from the East. A fine Worthington Duplex pump has been purchased for the hydraulic accumulator, to work the machinery of the melting house. It has two fourteen-inch high pressure cylinders; two twenty-inch low pressure cylinders, and a six and a half inch water cylinder.

It is proposed to make fine steel and build up a market for it on this coast. Steel will be made for forgings, shafting, structural shapes and rails.

No steel has been yet made on this coast. The mills have been rolling steel brought from England for the last three years, but they will now make their own. The new tariff now shuts out most of the English steel, and the majority of what we use comes from the East.

The rolling mills are quite busy at present, and employing from 750 to 800 men steadily. They are working largely in manufacturing goods. They have just finished the job of the material for the Market street cable road, and now have the contract for the material for the Sutter street road. We shall give some further details of the new steel works at the rolling mills in a short time.

SAN LUIS OBISPO is to build a big hotel.

Pacific Coast Inventions.

The MINING AND SCIENTIFIC PRESS Patent Agency is obtaining—as it has been for some years—the large majority of all the patents issued by the government to Pacific coast inventors. The business, however, is by no means confined to inventors on this coast, as patents are frequently obtained for foreigners and inventors in Eastern cities, a fact which our weekly lists and records prove. Dewey & Co.'s Patent Agency has been in existence so many years that the managers have a very thorough acquaintance with the needs of our inventors, and are thoroughly familiar with the details and requirements of the Patent Office. As a result, they have been very successful in obtaining patents, a fact which inventors recognize.

Within the past few years the number of inventors has greatly increased in the Pacific States and Territories. The exigencies to be met in comparatively new or isolated regions seem to sharpen men's wits, and when difficulties are encountered they are apt to be met by the individual without the usual dependence being placed on others. This has fostered invention in many branches. Moreover, new industries have arisen among us which needed appliances of a peculiar nature. In advice and assistance, Dewey & Co.'s Patent Agency has been of great service to these inventors, preparing their papers, informing them of the state of the art, and smoothing out difficulties, which their experience has enabled them to do. As a consequence, there has been a gradual increase of patronage from year to year, as is evidenced by the increased list of patents granted to Pacific Coast inventors.

THE strike of telegraph operators continues.

Primitive Bullion Makers.

The old arastra and Chile mill for crushing and grinding ore, and for amalgamation, though rude in construction and really "primitive," do their work well, but do it slowly as compared with machinery of modern date. While we have excelled in speed we have not done so much better in resultant yield as might be supposed. For pocket mines and distant localities where a few men work their own mines, the arastra still holds its own, nothing having been perfected to entirely displace it. A mule or two, with one of these rude appliances, will turn out many a profitable dollar, where a quartz mill with engine would entail failure. Of course, we speak of small mining operations.

In the line of smelting, the old Mexican or "Adobe" furnace has its merits also. We recently described this long-used furnace. It differs much, of course, from the modern water jacket, though the basis of operation is the same in both. It is simply the production of lead bullion carrying silver, the bullion in the case of the adobe smelter in question being afterwards refined, or the silver separated from the lead in a reverberatory refining furnace, and the litharge kept on hand for use over again with each lot of ore to be smelted. By this means the smelter can do without the large proportion of lead ores so essential to success in the case of furnaces of large capacity, where refining the bullion is not practiced. One of these adobe furnaces now running at Silver City, New Mexico, is said by a local cotemporary to be producing silver 96 fine. The two furnaces, both smelting and refining, are constructed of common adobes and much after the manner of the ordinary old-style brick concerns, that were in use until the water-jacket supplanted them. Of course, the mechanical construction is miserable, and the blast is furnished by a common large-sized bellows, while the surroundings are not of a kind such as one might see in more modern establishments. The silver is produced, nevertheless, and at a cost much below that which would be incurred by combined shipping and treating rates, were the ore sent elsewhere. Conversing with the man at the head of the concern, it was learned that the average charge was about 300 pounds, 100 pounds consisting of litharge and the balance of raw ore. One charge is usually smelted a night, while the furnace is in blast, and the manager states that to work night and day for a week, about 4,000 pounds of material could be run through, at a cost of about $70, or $35 per ton. The slag from the blast furnace contains about $5 per ton.

With a little "adobe" a lot of ore can be smelted as soon as produced from the mine, and the hand-to-mouth principle of the pocket mines is repeated. The trouble of handling ore in bulk is saved and the ore is made to yield its contents as soon as it comes from the mine. The adobe smelter is by no means to be despised despite its antiquity and crudeness of construction.

THUNDERING DOWN THE MOUNTAIN.—In widening the trail up Mount Scowden, a few days since, it became necessary to blast away a disjointed mass of granite forty feet long and twenty feet high. A charge of giant powder having been placed behind it and fired, the great block, weighing some 200,000 pounds, was toppled over into the smooth rocky bed of a steep ravine, leading down the side of the mountain 2,000 feet. Sliding down this smooth channel, the huge mass acquired at once a fearful velocity, and leaping more than a hundred feet at a bound, threw off great fragments that whirled through the air like a shower of cannon balls, one piece, weighing over a ton, striking at the base of the mountain and leaping clear across Mill creek, and burying itself deeply in the opposite bank. The miners in the neighborhood, startled by the concussion, supposed for a time that an earthquake had occurred.

THE Homestake Mining Company, of Dakota, has declared its regular monthly dividend of 40 cents per share, or $50,000, payable at New York. This makes $350,000 this year, and $2,112,500 since the commencement.

THE gross bullion product of the Tombstone mine for June was $51,400.

Metallurgy and Ores.

Nevada Metallurgical Works,

No. 23 STEVENSON STREET.

Near First and Market Streets, S. F.

ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores Worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, Etc.
Working Tests (Practical) Made.
Plans and Specifications furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines, plans and reports furnished.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER.

SCREENS

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving unversal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

DON'T FORGET THE STAMP.—Always take a last look at a letter before posting to see that the stamp is in place. Recently one of our agents in Los Angeles county found a letter containing $8 for one year's subscription to our paper, held for postage which the writer no doubt thought he had duly stamped, and but for the incidental finding of it by our agent, would of course have supposed we had received the money at the proper time. Let all subscribers when remitting or ordering their paper stopped be sure they duly stamp their letters.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stotefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

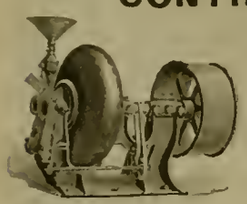
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES



Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. R. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 3 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best In Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanica in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

281,598.—DISH WASHER—Ella Wiseman, Fulton, Cal.

281,401.—STEAM MOTOR BOILER—Josef Schreiber, Vienna, Austria-Hungary.

281,373.—COFFEPOT—Thos. Keys, Chicago, Ill.

10,435.—TRADE-MARK FOR VINEGAR MADE OF WINE—Pacific Vinegar Co., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Amoug the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

ARM REST.—Wm. Butler, Salinas, Mouterey Co. No. 281,338. Dated July 17, 1883. This invention relates to a new and useful rest or support for the arm, the object of which is to enable one to steady his hand in aiming with a rifle or other fire-arm, or a bow of any description, or in sighting a telescope or spy glass, or for any other purpose which requires a firm and steady support. The left arm is fitted through an elastic band up to a point just above the elbow. The arm is turned with the palm of the hand up to grasp the rifle underneath, and the curved metal strip bears under the arm. A short arm or plate extends along the under side of the arm to the body, and the lower arm of the plate passes down the left side of the body, being secured firmly thereto by straps. A ratchet and pawl is so arranged as to hold the support and the arm. The arm is firmly supported at any inclination desired. The device is particularly useful as a rifle rest.

HEAD-BLOCK GEAR FOR SAW MILLS.—Melvin C. Meeker, Occidental, Sonoma Co., Cal. No. 281,100, Dated July 10, 1883. This iuvention relates to improvements in the gear for setting up the head-blocks in saw mills. The improvements consist in an arrangement of gears and clutches by which the head-blocks, when set up, may be drawn back with rapidity, thus losing no time, and also in a certain arrangement of levers joined to a single lever, and means for disengaging those of either end to operate both blocks, or only one, as the character of the work may demand. The object of the device is to enable the operator, after the log has been sawed up, to draw the knees back with greater rapidity than they are set up, to save time, and also to set both or either knee to such position as each particular log may require, or the object in view demands, such as is required in sawing telegraph poles and other tapering work.

MAGAZINE GUNS.—Howard Carr, S. F. No. 281,341. Dated July 17, 1883. The improvements in magazine guns covered by this patent are especially applicable to what is known as the "Winchester rifle breech mechanism." It consists of certain improvements in the carrier block, the firing bolt and extractor of empty shells, and the magazine by which the gun is adapted to fire cartridges of small caliber for gallery use. In such a gun as is used to kill small game, as squirrels or birds, with fulminating powder and small balls, the recoil from such ammunition is so small, no powerful recoil or breech block is needed, as the bolt is sufficient for the purpose.

COFFEE POT.—Thomas Keys, Chicago, Ill. No. 281,373. Dated July 17, 1883. Inside the main vessel is a coffee holder with a perforated bottom and partially perforated sides. The object of the peculiar construction is to expose as great a surface of the ground coffee to the action of the water as possible and to permit the water to permeate the mass with better effect and more thoroughly than if the bottom alone was exposed to its action. There is a suitable rim to prevent grounds passing out over the top when the pot is held at an inclination to pour out coffee from the spout. There is also a cap or cover for the end of the spout, which may be readily applied, and when not in use will still be at hand without being liable to be misplaced.

STEAM MOTOR BOILER.—Josef Schreiber, Vienna, Austria. No. 281,401. Dated July 17, 1883. This improvement in boilers consists of a boiler shell, supported upon and within an inclosing casing or stand, within which the grate or heating apparatus is contained. A series of tubes depend from the bottom of the boiler into the furnace, and within these are suspended smaller circulating tubes. The feed water enters the boiler after passing through a heating coil, and is caused to enter the small circulating tubes, through which it is led to the bottom of the inclosing tubes, converted into steam, and led through tubes to the upper part of the boiler without being reduced in temperature by passing through the body of water within the boiler. Steam for the engine is taken from the upper part of the steam space and passes by a pipe, through the fire space, where it is superheated before its exit.

MANIFOLD WRITING CASE.—Frank D. Scott and Oscar L. Gordon, Santa Cruz. No. 181,403. Dated July 17, 1883. This is a novel case or table for producing manifold impressions of writing. The object is to provide a convenient means for producing manifold impressions, for use by clerks and salesmen in stores, or for any uses requiring copies. The box is convenient to carry and furnishes a good surface on which to write. The layers of paper are always in position and the carbon paper need never be handled. When a memorandum is made, the ends of the writing papers are grasped and drawn out under the bands until they reach a point where a cutter will sever them below the writing. They are then torn off against the cutter with ease and precision. The sheets pass off the rolls within the box without interference. New rolls of paper may be readily inserted.

SMOKE BURNING ATTACHMENT FOR STOVES.—Wm. H. Richardson, S. F. No. 281,399. Dated July 17, 1883. This invention relates to an attachment to stoves, furnaces and radiators, and it consists of a chamber, formed in the pipe, between the furnace and the chimney, and a supplemental pipe leading therefrom to a point below the grate, and, in connection with these, of a damper or valve, whereby the products of combustion are returned to the body of the stove, furnace or radiator, through the space below the grate bars, to be exposed to the action of fire again, before finally escaping to the chimney.

ANIMAL TRAP.—James H. Cook, Lone Pine, Inyo county, Cal. No. 281,461. Dated July 17, 1883. This is a new animal trap of that class known as the "gravitating platform," in which the weight of the animal causes the foundation to give way and precipitate him into a receptacle. In this there is combined with the receptacle a cover, or lid, formed with a number of independent, hinged spring flaps, or sections, operating entirely below the level of the top of the trap, and hinged at the extreme outer edges. There are springs for resetting each section, and a bait arm for suspending the bait over the center of the trap.

WAVE POWER.—Wm. E. Jory, S. F. No. 281,370. Dated July 17, 1883. This invention relates to that class of devices specially adapted to be affected by the waves, and commonly known as "wave powers." It consists in a float having vertical screws connected with the main shaft by gearing, which transmits the vertical movement of said screws in a peculiar manner. The object is to provide a simple and effective means for utilizing the power of the waves and tides.

UTAH'S BULLION.—The Salt Lake *Herald* estimates that the bullion yield of Utah for the six months ending June 30, 1883, at $4,500,000. The monthly receipts of bullion at Salt Lake have been as follows for the period: January, $473,026; February, $577,041; March, $664,572; April, $563,342; May, $506,565; June, $453,480; total bullion, $3,238,026. This is exclusive of the value of the ores shipped to outside smelters. The product of the Mingo smelter is not included, nor any of the Silver Reef smelters, except the Stormont. The Crescent City mine has yielded much, but there are no returns from that mine in the above total. The Ontario mine has not done as well as usual, owing to improvements in progress.

THE Portland (Or.) *Daily News* reports that John McCafferty, from New York, has been prospecting for coal leads, and has located eighteen miles south of Renton three sections of land, the coal from which will make excellent coke. A company has been formed to reduce the coal to coke, which will be shipped to Butte, Montana, to be used in the reduction of silver ores, in which Mr. McCafferty is interested. These coal fields are said to be on the Seattle branch railroad.

IN 1872 the production of copper in the United States was 28,000,000 pounds, and in 1882 it had risen to 88,000,000. The Pacific coast raised the figures greatly.

The Late Wm. J. Lewis, Civil Engineer.

The subject of the following notice was well and favorably known to most of the old residents of San Francisco; but owing to his retiring and shrinking nature and habits, only a very few, even of his intimate friends, were acquainted with his life history. A brother engineer, another of San Francisco's old and respected citizens, Sherman Day, has furnished us with a brief obituary which will no doubt be read with much interest by our readers generally:

Wm. J. Lewis was born in Chester county, Penn., April 4, 1812. His father was a teacher of the Quaker denomination, eminent for his skill in mathematics, and anthor of several works on arithmetic and algebra. The elder brother of W. J. Lewis—Judge Joseph J. Lewis, of Westchester—was Commissioner of Internal Revenue under President Lincoln. William inherited his father's mathematical talent, and at the early age of sixteen was a correspondent of the *Mathematical Diary*, a New York paper, solving some twenty difficult questions in mathematics. Throughout his life nothing seemed to please him more than to sit up all night solving some intricate problem. He received his early education from his father. He chose civil engineering for his profession, and served as an assistant under John Edgar Thomson, an eminent engineer of Pennsylvania, who had been a pupil of Lewis' father. After a sufficient experience gathered in that school he became a resident engineer on the Louisville, Cincinnati and Charleston railroad, at a period when John C. Fremont was employed on the same work. He afterwards served successively as Chief Engineer of the Brooklyn and Jamaica railroad, on Long Island, and of the Norristown, Doylestown and New Hope railroad and of the New Jersey Central railroad. Afterwards, for the six years from 1842 to '48, Mr. Lewis was a teacher in Philadelphia. During the three last years of this term he was at the head of a school of his own for teaching mathematics and engineering.

In the year 1849 he came to California as a member of one of the companies, so common at that time, for mutual outfit and protection. The company commenced work in the placer mines at Sullivan's diggings in Tuolumne county, but they soon dissolved as a company; some staid in the mines and some left, and among the latter was Mr. Lewis. An Irishman of the company, who stuck to the mines about sixty days and then left, being questioned as to his reason for leaving, replied that mining didn't suit his "jaynius." Mr. Lewis was probably actuated by the same motive. He came to Santa Clara county, and during the first year was associated with Mr. Hathaway, Captain Winslow and others in cultivating a small tract in the southern suburbs of San Jose. But farming was no more to his taste than mining, and he opened an office in San Jose in 1850 for the practice of his regular profession. He also went into partnership with a brother surveyor for owning and cultivating a 100-acre tract near San Jose, but the place which they occupied for about three years was of more value as a surveyor's home than for the profits of cultivation. Soon after the county of Santa Clara was organized, Mr. Lewis was appointed County Surveyor. He was elected to the same office in 1852, and re-elected in 1854, retaining the office until June, 1855, when he resigned to accept the office of City Surveyor of San Francisco. His surveys in the county of Santa Clara were characterized by accuracy, impartiality and neatness of mapping, and the records of them are regarded as specially reliable.

In September, 1851, he was selected as chief engineer to make the preliminary survey and location of the San Francisco and San Jose railroad, which he performed during the autumn of that year, presenting a satisfactory report and map. The funds for the construction of the road were not raised for several years, and it was not till 1855 that he was called to make a second survey, and a third in 1861, when its construction was begun, and he remained Chief Engineer till 1863. While the San Jose railroad remained in abeyance, he made a preliminary survey of a railroad from Marysville to Benicia. After the completion of the San Jose road in 1863 he became Chief Engineer of the Western Pacific railroad, from San Jose to Sacramento, while it was under the charge of Judge Dame, previous to its transfer to Stanford & Co. He also made a survey for the extension of the San Jose railroad to Gilroy. In 1853 he was appointed U. S. Deputy Surveyor, and between that date and 1861 he surveyed a large number of ranches under Mexican grants, and several at still later dates.

Among these surveys was one of the line between the claims of the New Almaden Mine and the Capitancillos rancho, involving the evidence to be derived from the growth of trees blazed long years since. The chips from these old blazes were cut out and exhibited at the trial before Judge Hoffman; and in his evidence Mr. Lewis referred to the old trees which he had seen during his railroad surveys in South Carolina at the battlefield of "The Cowpens;" these trees still carrying the balls shot into them at the time of the battle. Another very important one of his ranch surveys was the location of the "Panoche Grande" grant—(McGarrahan's)—according to the calls of the grant which placed it between two well known adjoining ranches named in the grant, and limited the number of leagues. After having finished his location on the ground, Mr. Lewis inquired of some of the party in attendance,—"now where is the New Idria Mine?" And he said "they pointed it out as near a mountain away off to the south in the blue distance about 25 miles."

In June 1855 he was appointed city surveyor of San Francisco, which place he held until the passage of the Consolidation Act in 1856, when the county officers supplanted those of the city. In 1866 he submitted plans for the sea-wall around the waterfront of San Francisco, which were accepted, and he was appointed Chief engineer in May 1867 to superintend the work. He held this position until 1870.

Whenever Mr. Lewis was in charge of any work as Chief Engineer, he took hold of it with enthusiasm and diligence, bringing to it his extensive practical experience, and displaying much executive ability in his selection of assistants and subordinates, and in the details of the management; and his notes, records and reports were carefully made and entitled to full confidence. No charge of incapacity, or trickery, venality or "crookedness" was ever breatbed against him. He was a man of the strictest integrity; in social manners affable and unostentatious; and universally esteemed by those with whom his professional business brought him in contact, as well as by his professional brethren. Mr. Lewis derived his appellation of "Colonel" from an appointment as Engineer on the staff of Major Gen. Halleck then of the State Militia, a few months before the civil war.

After the leading railroads of California past under the control of the owners of the Central Pacific, the business of railroad engineering in California fell mainly into the hands of their engineers; and those who had not enlisted under their banner were left out in the cold. Mr. Lewis was one of the latter. He still continued to attend to the surveying of ranchos, and smaller tracts, and such occasional miscellaneous engineering as offered. He was frequently called on to make elaborate computations, and write up notes where special accuracy in figures was needed. He sought for a position, for which he was eminently fitted, as a teacher of mathematics, but in this he was not successful. He occasionally contributed articles on his favorite science to the public press.

When he removed to San Francisco his wife and only son joined him from the East, and he purchased a homestead in this city, where they dwelt pleasantly for more than a quarter of a century. But a dark cloud was cast over their home by the death of their only child, a son just coming to manhood, who was accidentally killed on the San Jose railroad some years since. Mrs. Lewis, a most estimable lady, who had been the main light and comfort of his home, died a little more than a year before her husband. Mr. Lewis still continued to dwell at his old home, but the last year of his life was a lonely and sad one for several reasons, until at length his naturally strong constitution yielded to an attack of kidney disease, and he died on the 7th of July, 1883, at the age of seventy-one. He leaves one brother in this State, a farmer in Santa Cruz county, and another in Minnesota.

A HISTORY OF CALIFORNIA.—A. Roman, of 120 Sutter street, S. F., has just published a revised and enlarged edition of "A Popular History of California" from the earliest period of its discovery to the present time, by Lucia Norman. It is amost excellent little work (216 pages), and not simply a dry statement of facts, names and dates, but is written in an animated and elegant style. It is comprehensive and compact—a marvel of conciseness—from the preface to the end. The only illustration in the book is an excellent copy of Nahl's famous painting, "The Sutter Mill," which has now become an historical picture, so much prized by all early Californians. The book is for sale at all book stores, and mailed to any address, postage paid, upon the receipt of price by publisher.

BANISH ill health, nervousness, vexation, fretfulness, etc., by using Brown's Iron Bitters.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for so many years, the firm name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That is this understood and appreciated is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Mechanics' Institute.

The Mechanics' Institute of this city is now taking some little trouble to increase its membership, and rendering the advantages it possesses available to a larger class of people. The trustees have issued cards inviting the public to pay a visit of inspection to the library and reading rooms on any Saturday evening. There will be some one to escort visitors around the rooms and explain to them the workings of the Institute.

The library rooms are large, well lighted, easy of access, and include a private conversation and reading parlor for ladies. The library contains 33,000 volumes, the circulating department, 16,000; is well selected, and new standard and popular works are added as they appear. The reference department is unusually comprehensive, contains many valuable works not possessed by other libraries on this coast, and is recognized as the best educational library in the State. Members enjoy all the privileges of a private library, the rules permitting personal access to the shelves. The reading rooms are well supplied with papers, magazines and reviews from all parts of the world, especial attention being given to scientific and educational publications. The chess room is the largest and finest in the country, and the strongest players on this coast, attracted by it, have become members of the Institute. This institution has been made the official repository for patent reports by both the English and American governments, thus making membership of benefit to manufacturers and indespensable to inventors.

The dues are only fifty cents per month and the initiation fee $1, while a life membership may be purchased for $50. The trustees have wisely concluded also to give members of the Institute double or single season tickets for the coming fair, for half the usual price. For general information we append the following on this subject: The double season ticket will admit the owner and any lady and one child, under eight; or, any two ladies and one child, under eight; or, any lady and two children, under eight; or, the owner and two children, under eight, but must not be presented by any gentleman other than the original owner. If a lady member purchases a double season ticket, it will be issued as a lady's ticket, in her name; no gentleman can use it, but any two ladies and one child, under eight, can have admission thereon. The single season ticket is not transferable. Tickets at above reduced rates are sold to members only. The price of tickets to the general public is unaltered, viz.: Double season, $5.00; single season, $3.00; child's season, $1.50; apprentices season, $1.50; adult single admission, 50 cents; child's single admission, 25 cents.

THE Salt Lake *Tribune* hears of an important mining sale in American Fork canyon, in which Mr. Natt. Cullen, of Horn Silver fame, sold to John M. Burke, Esq., and Delaney Bros., a half interest in three mining claims for $70,000—the Mary Ellen, Live Yankee and Extension. It is a good sale, and we understand the purchasers will proceed at once to the thorough opening of their property, in which there are large bodies of ore.

NO MATTER what your ailment is, Brown's Iron Bitters will surely benefit you.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HUAG—California.
B. W. CROWELL—Arizona Territory
M. H. JOSEPH—Eureka, Nev.
I. M. LEHRY—Los Angeles, San Bernardino and San Diego counties.
A. C. KNOX—Oregon and Washington Ter.
J. J. BARTELL—Yolo county.
E. P. BULKINS—San Luis Obispo Co.

IMPORTANT additions are being continually made in Woodward's Gardens. The ground walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing only one cent) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent

Know

That BROWN'S IRON BITTERS will cure the worst case of dyspepsia.

Will insure a hearty appetite and increased digestion.

Cures general debility, and gives a new lease of life.

Dispels nervous depression and low spirits.

Restores an exhausted nursing mother to full strength and gives abundant sustenance for her child.

Strengthens the muscles and nerves, enriches the blood.

Overcomes weakness, wakefulness, and lack of energy

Keeps off all chills, fevers, and other malarial poison.

Will infuse with new life the weakest invalid.

37 Walker St., Baltimore, Dec. 1881.
For six years I have been a great sufferer from Blood Disease, Dyspepsia, and Constipation, and became so debilitated that I could not retain anything on my stomach, in fact, life had almost become a burden. Finally, when hope had almost left me, my husband seeing BROWN'S IRON BITTERS advertised in the paper, induced me to give it a trial. I am now taking the third bottle and have not felt so well in six years as I do at the present time.
Mrs. L. F. GRIFFIN.

BROWN'S IRON BITTERS will have a better tonic effect upon any one who needs "bracing up," than any medicine made.

QUICKSILVER.

THE CELEBRATED **A** BRAND.

Shipped Direct from the New Almaden Mine,

New Almaden, Santa Clara Co., Cal.

For sale in any quantity. Trademark A on top of Flasks secured by United States Patent, and regis'd in Utah. Flasks contain 76½ lbs. Quicksilver. Weight and purity guaranteed.

CARLOAD LOTS will be shipped from San Jose, f. o. b., for Nevada, Arizona, New Mexico, Montana and Idaho or Utah, or delivered at Pacific Mail Steamship Co.'s wharf, and Depot of S. P. R. R. Co., San Francisco, without charge. Railroad rates from San Jose are the same as from San Francisco.

Redlands.

The most delightfully situated colony in Southern California.

Remarkably healthy, being 2,000 feet above the sea level.

Wholly devoted to fruit culture, and especially adapted to oranges and raisins.

Advantages of church, school, store, depot, hotel, stage line, telegraph and telephone.

Illustrated Circulars on Application.

JUDSON & BROWN,

Redlands,

SAN BERNARDINO. CALIFORNIA.

Is the Best Pump in the World. Another New Improvement is Lewis' Patent Spray Attachment.

Can change from solid stream to spray instantly. Regular retail price, $6. Weight, 4½ lbs. Length, 32 inches.
FOR SALE BY JOHN H. WHEELER,
111 Leidesdorff St., S. F.
P. S.—A sample can be seen at this office.

PRINTERS, AUTHORS, INVENTORS, PATENTEES, BUILDERS, MANUFACTURERS, MACHINISTS, MERCHANTS, and other trades-people can have satisfactory Engravings and Electrotypes made at moderate prices by the S. F. ENGRAVING CO., No. 405 KEARNY ST. Send photographs, sketches, drawings, models or samples for estimates. Map and Woodcut Engravings enlarged or reduced by the aid of photography, at less than one-half the cost of the originals and in a short time. Photo-relief, Zincograph and other improved methods employed.

LAND Good land that will raise a crop every year. Over 12,000 acres for sale in lots to suit. Very desirable Fruit, Vine, Grain, Vegetable, Hay, and Pasture Land. Near Railroad and Sacramento river; $3 to $30 per acre. Wood and water convenient. U. S. Title perfect. Send stamp for illustrated circular, to EDWARD FRISBIE, Proprietor of Reading Ranch, Anderson, Shasta Co., Cal.

REMITTANCES to this office should be made by postal order or registered letter, when practicable. Cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts. per half ounce), 10 cts.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We bold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composits.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be rivsted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, rivsted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

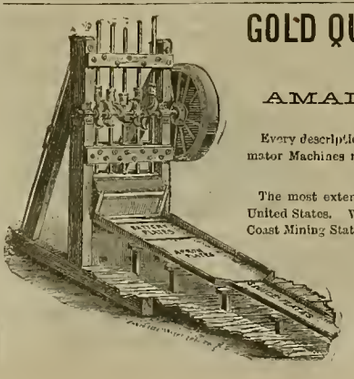
EXCELSIOR BLASTING POWDER,



Manufactured by the

EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro Glycerine Powder, as safe to use and handle as any other Nitro Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

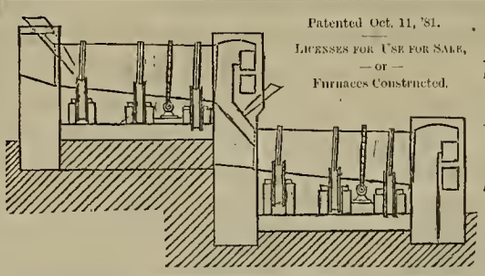
To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.



That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,

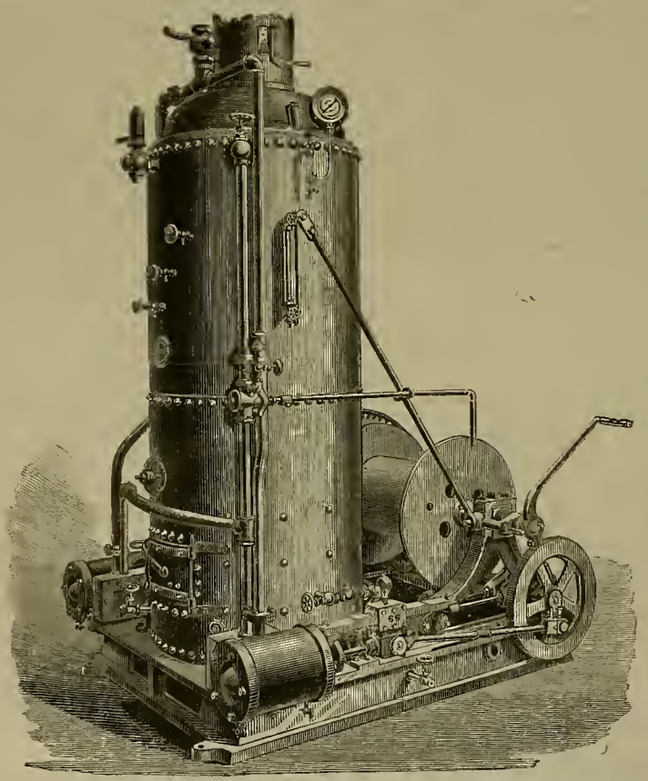
Utilizing Lead Fumes.

Ordinary commercial oxides of lead have usually been manufactured by heating metallic lead in an oxidizing reverberatory or revolving furnace, or by heating white lead in such furnaces to drive out carbonic acid and combined water. It has been found, however, that the same oxides of lead may be manufactured more economically from the waste lead fumes of lead smelting furnaces. The composition of waste lead fumes depends much upon the character of the lead and of the lead ore being smelted, and also upon the kind of furnace used.

An inventor has discovered that by subjecting waste lead fumes to the action of carbonate of soda, or caustic soda, the arsenious acid is made soluble and the sulphate and sulphite of lead are converted into compounds, from which by roasting may be produced commercial oxides of lead. By the roasting process the carbon is oxidized and burned out, while the sulphurets and lead are converted into sulphurous acid and oxide of lead. This can be done by mixing the waste lead fumes with soda ash and burning this mixture in an ordinary litharge furnace till the proper color is obtained. Then the mass is taken out and washed to separate the soluble part from the insoluble, and the oxide of lead is finely ground for the market.

In the various samples of waste lead fumes analyzed, and in descriptions of analyses on record, it is found that waste lead fumes contain more or less carbon and sulphurets of lead, while much the greater portion of the lead present is in the form of sulphate, sulphite and oxide of lead. There is also generally present more or less arsenic—say from 7 to 20 per cent. In a sample of waste fumes from the smelting of argentiferous lead ore, was found: 0.50 moisture, 1.50 carbon, 53.79 sulphate of lead, 29.34 oxide of lead, 2.67 sulphurets of lead, 8.09 arsenious acid, 0.005 silver, 2.28 oxide of zinc and 1.825 antimonious oxide, oxide of iron, alumina and lime.

The following is the modus operandi as carried out by the inventor: The waste lead fumes are made into a pulp by water and then boiled with a solution of caustic soda, or for economical reasons, better, with a solution of carbonate of soda from one-half to one hour and longer, if much arsenic is present. The amount of carbonate of soda varies with the composition of the waste fumes. Each equivalent (151.5 parts) of sulphate of lead and (143.5 parts) of sulphite of lead, requires one equivalent (53 parts) of carbonate of soda; and to each equivalent (99 parts) of arsenious acid, one equivalent (53 parts) of carbonate of soda, though less might be used, while more is unnecessary.



For 1,000 pounds waste fumes of the above composition, should thus be used about 232 pounds of carbonate of soda, or its equivalent of commercial soda ash. After boiling the insoluble part is allowed to settle and the mother liquor is run off, and the arsenic may be eliminated from this, and the sulphate of soda gained by evaporation and crystallization. The insoluble part is washed well, and is then ready for the furnace. It is preferable to press it first in a filter press, and then place the pressed cakes in the furnace, where it is changed into litharge or red lead, according to the temperature and time employed. After burning the oxide of lead is ground, and is then ready for the market.

The Lidgerwood Mine Hoist.

The Lidgerwood portable hoisting engines, while fitted for pile driving, wharves, etc., are specially adapted for mines and quarries and for prospecting purposes. The patent friction drums are a decided improvement on the old clutch engines for every kind of hoisting duty. They are quicker to manage and handle. The friction is composed of iron and wood, the wood being of the hardest kind, placed endwise of the grain to the wear, and will last for years with all kinds of hard duty. The hoisting engines are of recent design, and contain all the improvements suggested by years of experience in this particular line.

The design is of the smaller or dummy locomotive type, and all their connections, valves, steam passages, pistons, etc., are calculated, balanced and fitted for rapidity of action, economy in use of fuel, durability, etc. Steel is used throughout for piston rods, valve stems, cross heads, crank, valve and pump rod pins. The cross head gibbs and connecting rod boxes are of the best composition. All journal bearings are filled with anti-friction metal. All wearing surfaces have proper provision to take up all loss motion, and are fitted with good oiling devices, etc. The gearing, being cast from cut wheel patterns, runs true, smooth, and wears well. Every part is fitted to the bed plates upon faced surfaces and secured by a superior quality of bolts, nuts and studs; steady pins are also used, and each engine can be entirely taken apart and replaced again in exact line by ordinary intelligence. The cylinders are fitted with Russia sheet iron jackets, drainage cocks, and a steam chest relief cock upon single engines for convenience in backing down heavy lifts, getting off center, etc. Lubricator upon steam pipe, and oil cups upon cross heads, are also supplied. Each engine is furnished with gipsy or winch head upon one end of drum shaft; also a flat faced band fly wheel upon crank shaft for any belt power duty required.

The boilers are large, and are made of the best brands of iron and tubes, lawfully stamped, tested, etc. They have all fixtures complete, specially made for the purpose, viz: Improved safety valve, steam gauges, water gauges, gauge cocks, stop, check, blow and throttle valves, three way exhaust cocks, to exhaust in or out of smoke stack, grates, fire-tight ash-pan, fire tools, smoke stack with cover, substantial cast-iron smoke-stack done on top of boiler, etc., complete. The pumps are of simple and reliable form. They are driven direct from the crank shaft by an eccentric and long connection; and are also provided with all drainage and air cocks for relief and cold weather uses. A suction valve and ten feet of suction hose are furnished with each engine. Between pumps and boilers on delivery pipes a check and stop-valve is used. This stop-valve is so arranged that if it is left shut off and the pump started to work, no accident or damage will happen to either pumps or feed pipe connections, as the force of the water will open this valve itself and pass into the boiler. By this device many breakdowns are prevented. The Berry & Place Machine Co., of this city, have recently accepted the agency of these hoisting engines for this coast. A number of styles are made, both of single and double cylinder. Some four styles are carried in stock here adapted for special work,

SINGLE CYLINDER LIDGERWOOD PORTABLE HOISTING ENGINE.

The Mineral Exhibit.

A creditable mineral display will be made at the State Mining Bureau this month, although the assistance it was hoped would be rendered was not by any means liberal. Only five counties in the State contributed money, mineral and cases for the separate county displays. These were Butte, Mono, Inyo, San Bernardino and Tuolumne. From Inyo county, particularly, came a very creditable and extensive lot of minerals. This is due, no doubt, to the constant reminders the Inyo *Independent* gave the people, and to the perseverance of Capt. J. M. Keeler, who greatly interested himself in the matter.

Aside from this, the amount collected from the public by the citizen's committee was insignificant, although Mr. J. Z. Davis, who has always been generous to the Mining Bureau, headed the list with $250, followed by Capt. McDonald with $50. But here the matter practically stopped. People who were asked to contribute to an exposition of minerals during the Conclave thought it was a matter for the State, and not for private individuals to carry out. This view was so prevalent that the idea of raising any suitable amount of money from the public has been practically abandoned.

The Mining Bureau funds were at a low ebb; and not withstanding the appropriation by the Legislature of $3000 per year, for two years, in addition to the income from taxes under the organic act, the State Mineralogist states that the expenses exceed the income. Therefore, the citizens' committee was appointed when it was proposed to get up the exposition.

It was hoped this committee would be able to relieve the Bureau, but it has not done so. Thanks to the three years' work already done, however, a good showing of minerals will be made, and the Bureau is now closed temporarily while preparations are going on.

Aside from the minerals which have been sent by the respective counties mentioned, a large number of miscellaneous minerals have been collected for this special exhibition. These counties have their own cases and minerals, the State Mineralogist taking care of and arranging the collections. We visited the Bureau this week and saw that a good display of minerals and ores would be made, though it is by no means as large as should be the case in the center of a mining region like this. Nothing but lack of money prevents a display that would do the State credit. We have plenty of minerals, but it takes time and labor to collect and arrange them.

The Los Angeles *Herald* says: The owners of the King mine, at Calico, held a meeting yesterday at the Calico Union, and the Oro Grande Mining Companies, Temple Block, and received the report of the President, Colonel Markham, of the operations of the company since the first of March last, when the mill commenced running on the King ore. The ore proved so rich that additional amalgamating pans were required, and were placed in position last month, so that the full capacity of the mill has not been obtained, except for the past month. However, it appears that after paying all expenses the company is in a fine condition, and yesterday declared a dividend of $16,000. The mill is now running on average ore, not selected for richness, and turns out $50,000 a month, with ten stamps, which is good enough for anybody.

CORRESPONDENCE.

Mines of Stockton Hill, Mohave County, Arizona.

EDITORS PRESS:—Having lately returned from visiting some of the most promising mines of this district, and knowing that the MINING AND SCIENTIFIC PRESS takes a lively interest in everything pertaining to the mining industry, and is looked upon as the most valuable medium of information in mining affairs, I will improve a leisure hour in dropping you a line. This, as most of your readers are undoubtedly aware, is an old district. Away back in the "60's," when this country was a *terra incognita*, and a trip into its mountain fastnesses was environed by every danger—the toilsome march across the trackless desert, in the face of desiccating winds that fanned the weary adventurer like a blast from the tweers of Hades; when to lose a canteen or miss a spring was to die, calling, like Dives, for one drop of water to cool the parched tongue; when every bowlder and every cluster of mesquite was liable to ambush a treacherous, merciless foe—a few hardy adventurers, crossing the country from California, and coming down from among the silver mines of Nevada, discovered unmistakable evidences of a prolific mineral-bearing section, and located the Wallapai mining district. Many of the original locators, after braving every danger, enduring every hardship, and having "sowed that others might reap," have sealed their devotion with their lives, and now sleep on its rocky hillsides. But their places have always been filled by others no less willing to stake their all on, and with no less faith in, the ultimate outcome of the district. I have long wished to visit this district, of which I have for years heard so much, and, coming down the A. & P. road a few days since, and finding myself at the embryo town of Kingman, within a few miles of Stockton Hill, I resolved to gratify myself, and have

A Look at its Mines.

A pleasant ride of some seven miles (per buckboard) up a gradual rise, and I found myself at the foot of the hill immediately below the little mining town of Stockton, and then a short walk of half a mile up a new grade just completed by Mr. Springer, of the "Cupel," and I am in Stockton, a veritable mining camp, scattered irregular, with no attempt at streets or corner lots, accommodating itself to the inequalities of the surface. We have seen its prototype on many a mountain side. The smug cabin behind the cedar, the inevitable forge, the spring in the gulch, and that invaluable but unappreciated quadruped, the burro, nipping the grass among the rocks, a-looking wistfully in at the cabin door for any stray morsel that might come its way. And here are

Bearded, Manly Men.

We have seen their prototypes before, men who have confronted dangers, combatted obstacles, battled with the forces of nature, until, vulcanized in the fires of experience, they have (perhaps unconsciously) become the true pioneers of our civilization. While in Kingman I met a gentleman acquainted in the country, and on inquiry was informed that, among the valuable properties of the districts, the cluster of mines owned by the Grey Bros. was, perhaps, the most conspicuous, and was advised to call on them on my arrival at Stockton. I also learned that the celebrated "Blue Bell" and "Miners' Hope," of which I heard flattering reports while in distant portions of the Territory, belonged to these gentlemen. On my arrival I lost no time in calling on them, and was agreeably surprised to find in them old Mexican acquaintances of whom I for years lost sight. I remember a Mr. Thom as a boy, as a Comstock miner of twenty years ago, and afterwards as a pioneer of Eureka and Pioche, and Mr. Robert Grey, as an experienced Nevada silver miner, associated with Mr. John B. McGee, in the White Pine days. These gentlemen kindly consented to escort me through the mines, and the following morning, accompanied by Mr. Thomas Grey, I started on

My First Day's Trip.

I will endeavor to give your readers the result as briefly and lucidly as possible. Our first visit was to the Cupel, a mine owned by Spranner, Scanly & Co., of your city, and under the management of Mr. Springer. At the present, no developments are being made, as Mr. Springer is actively engaged in timbering the main shaft, which is down some seventy feet, finishing his hoisting appliances, etc., preparatory to active operations in the near future. They have a fine house just erected for the accommodation of employes, a substantial building over shaft, stables, etc., and everything about the mine looks like business. Mr. Springer has had many obstacles to contend with, but is energetically overcoming them, and is evidently "the right man in the right place." There are old workings on this mine that we did not explore, among them a shaft 150 feet deep. I learn from disinterested parties, that under the old inconvenient mode of working, $150,000 have been extracted from this mine. We next visited the

Fountain Head,

A mine owned by the Grey Brothers. This mine is situated on the north side of the mountain, south from Cupel canyon, and one fourth of a mile due west from the Cupel mine. It is a fifteen hundred-feet location, with a general trend of northwest by southeast, and a slight westerly dip. The vein matter (gangue) of this mine is not less than twelve feet, and the ore vein, as shown in the two shafts, 1,000 feet apart, is three feet in width. Shaft No. 1, 200 feet from southerly bounds, is down thirty feet; and shaft No. 2, 800 feet northerly, is fifty-five feet in depth, the vein in one being almost a fac-simile of that in the other. The ore of this mine, of which there are some fifty tons on the dumps, carries about twenty-five per cent lead, and averages from actual working tests $40 per ton in silver, with a small percentage of gold. The Fountain Head is a contact vein, lying between granite and porphyry. At the northerly end of the mine, a fine spring of water has been developed. Going almost due west, and climbing the mountain some half mile, we come to the

Blue Bell,

Another mine owned by the Grey brothers. This is another immense ledge, boldly plowing the country rock, and cropping at intervals its its entire length (1,500 feet). This mine has considerable surface development, crosscutting, etc., plainly demonstrating that it is a monster in size, the vein matter being not less than twenty feet in width. Four hundred feet from the southerly boundary a shaft has been sunk sixty feet, all in ore. There are about fifty tons of ore on the dump of this shaft. One thousand feet northerly on the ledge from shaft 1 is shaft No. 2, twenty-five feet in depth. The ore vein in this shaft is about two and one-half feet in width, and there are some fifteen tons on the dump. The ore of the Blue Bell is a chloride, and averages about $75 in silver, with some $20 per ton in gold. Assorted ores from this mine have been reduced at distant reduction works (San Francisco, and Pueblo, Col.) that have reached much higher figures. The formation is the same as that of the Fountain Head—what miners call "friendly" rock, easily worked. A company owning this mine and a twenty-stamp mill in a convenient location need have no fears for its financial future.

The Charlotte,

A mine also owned by the Grey brothers, and situated about one mile in a southwesterly direction from the Blue Bell, and on the western slope of the range, near Todd basin, consists of two parallel veins, some seventy-five feet apart, within the boundaries of the location. The widest stratum is about ten and a half feet in width. The ore is a chloride, carrying no appreciable quantity of lead, and, assorted, averages about $175 per ton. This mine has been utilized by the Grey brothers as a "chloriding" mine, *i. e.*, a mine that could always be relied on for a "grub stake," as where a few hundred dollars could be extracted on short notice, to meet any financial emergency. Outside parties, to whom the mine has been leased, are at present engaged in working it, and a few days since shipped a carload of ore to Albuquerque, N. M. Leaving the Charlotte and following the trail almost due north, about a mile, we arrive at

The "Alpha."

This mine is owned by Messrs. Cole & Caffery, two energetic, practical miners. These men, instead of waiting for "something to turn up," are very busily engaged in turning up a very fine mine. They have at present in main working shaft attained a depth of 120 feet. The pay ore in shaft from surface down will average about three and one-half feet. Like other mines in vicinity, the gangue is very much wider. The Alpha produces some very high grade ores, assays of selected samples going into the thousands, the average of entire pay stratum going in the vicinity of $100 in silver with a respectable percentage in gold. Messrs. Cole & Caffery, while sinking main shafts, are extracting some ten tons per week, and are at present shipping their ores by A. & P. R. R. to Pueblo Col. I learn that my old friend, M. P. Collins, formerly of San Jose, is the fortunate owner of the extentions of the Alpha. Having taken a lunch with the Alpha boys, we pressed our way due north some half mile, and arrived at the

Silver Monster.

This ledge, as regards size, is appropriately named, and is indeed a monster. There are two prominent locations on the ledge, besides several extensions. The Cincinnati, owned by a syndicate of New York capitalists, known as the Fairfield and Cincinnati Company, and the Silver Monster, owned by the Grey Brothers. The Cincinnati, fifty feet from the line of Silver Monster, has a shaft 150 feet in depth. In this shaft three crosscuts have been to the hanging, one at a depth of fifty, one at the depth of 100, and one at the bottom of the shaft, all in ore. The Silver Monster has a shaft, thirty-five feet in depth, in ore. I would not attempt, even approximately, to give the width of this ledge; as its name indicates, it is a monster. The ores of this ledge, while of immense quantity, are of heavy galena, low grade, and undoubtedly of a refractory nature. Turning to the right, and following the comb of the mountain towards home a walk of half a mile brings us to what is usually conceded by all as being the finest prospective mine in Northern Arizona.

The Miner's Hope.

This is another ledge of immense size, the mineral formation being not less than twenty feet in width. It is situated on the crest of the mountain west of the Cupel, and crosses the summit obliquely, cropping boldly far down on either side. It has been opened by shaft, at about the center of the claim, to a depth of seventy feet. The pay vein, as shown, the entire depth of shaft, is three feet wide, and averages $90 per ton, in gold and silver, (under the old, expensive and inconvenient facilities for disposing of ores. Over $5,000 have been already realized from ores taken from this mine. The Miner's Hope is admirably situated in regard to working facilities, as it can be easily opened by tunnels or drifts running in on the ledge. This is certainly a most flattering prospect for a magnificent mine, and I think I hazard nothing in prophesying that in the near future, among the very first mines of the coast will be mentioned the Miner's Hope, of Stockton Hill, Mojave Co., Arizona. Descending the mountain, on the north side of Cupel canyon, as we near home we come to the

Pure Metal,

A vertical ledge, in the same formation as the others described, and holding the same general course. While having a big formation, the ore vein proper is of a width of about three feet, and is, as its name indicates, a vein of pure metal, running about eighty per cent in lead, and carrying about twenty-five dollars per ton in silver. New Mexican parties are at present negotiating for 1,000 tons of ore from the Pure Metal.

The Miners of Stockton Hill

Have, since the location of the district, labored under every discouragement and disadvantage incident to life in a mining camp isolated from the world as this has been. All the necessaries of life were to be had only at fabulous prices. Parties looking for mining properties were loth to undertake a journey fraught with so much inconvenience, not to say peril; and parties visiting the district were appalled at its isolation, and deterred from embarking in mining enterprises where such formidable obstacles presented themselves. Again, ores, in order to leave even a small margin of profit to the miners, must needs have been of fabulous richness. But the spirit of progress has smitten the desert with its iron wand, and everything is changed. The iron horse now shrieks at the foot of Stockton hill; provisions, powder, tools, machinery, and everything essential in the development of a mining district can now be had at prices ridiculously low, in comparison; lumber sawn from the mills of San Francisco mountains, can be delivered at a point seven miles from Stockton hill at a cost of about twenty-five dollars per thousand; coal from the mines of Gallup, N. M., at $10 per ton. While small quantities of ore are often found of fabulous richness, the great mass of the ores, as in every other district that any of us have ever visited, are what we have been used to call "low grade," is from $40 to $80 per ton. And certainly, what I have already seen satisfies me, beyond a doubt, that the quantity of this character of ore is practically, without limit. The character of the country rock vouches for the presence of an ample water supply, even ignoring Oak creek, within five miles of the principal mines. Any miner can see from the "friendly" character of the country rock, that mining will be comparatively inexpensive, and it requires no prophetic vision to see, in the near future, a brilliant prospect for the mines and miners of Stockton Hill.

C. C. B.

Oregon Nickel.

EDITORS PRESS:—Permit me to reply to Mr. Lovelock's article in your last issue. I am personally acquainted with Mr. Wm. S. Bell, part owner of the mines referred to, and showed him my results. He was so much pleased that he wished me to work some of his ore; and since then, his partner, Mr. Curtis of Oakland, has informed me that he expects to receive four hundred pounds for that purpose. Mr. Lovelock must know that a single smelting of Mr. Bell's ore would not produce metallic nickel, but speiss (nickel arsenide), which would have to undergo other treatments before metallic nickel could be obtained. No furnace of "peculiar design" would effect this result. If Mr. Lovelock will examine the "several bars of nickel smelted from the ore as taken from the ledge," he will find them to be speiss, not metallic nickel. Mr. Bell told me he had made a number of experiments, but had not succeeded in obtaining metallic nickel, except by reducing the oxide obtained by chemical treatment. He showed me a small button obtained in this way, which weighed a few grains. The ore from which I obtained the first bar of metallic nickel produced on this coast was garnierite from Oregon. This bar is now in possession of Edson Adams, Esq., of Oakland, the owner of the mine. I have a process especially adapted to nickel ores containing sulphur, arsenic and antimony, which I hope to prove to Messrs. Bell & Curtis to be the most economical and practical method for working their ore.

Yours respectfully,

GEO. J. ROCKWELL.

San Francisco, Cal., July 25, 1883.

NEW MILL STARTED UP.—On last Saturday morning the new mill lately completed on the Premium mine was started up for the first time. The mill machinery was made at the Greenville Iron Works, and is as thorough in finish as it is complete in detail. The owners of this mine are all working men. During the past five years they have patiently and steadily worked to develop their property. They did not attempt to build a mill till they had first satisfied themselves that there was ore enough to warrant such a step, and it is to be hoped that their most sanguine expectations may now be more than realized. A. A. McKenzie is amalgamator.—*Greenville Bulletin.*

Conveying Water to Mines.

In the Mint Director's report is a chapter on Nevada county, from which we take the following extract:

The water supply of the Eureka Lake and Yuba Canal Co. is the most extensive of any company in the State. It consists of a system of ditches aggregating in length about 200 miles, conveying the water from various sources of supply high up in the mountains; a series of storage reservoirs, three or four in number, located at an elevation of 6,000 feet above the sea level, holding and furnishing water during the summer months, when the supply of the streams is diminished or cut off; also a number of distributing reservoirs, so situated near the points of delivery that they may receive the water from the ditches, and distribute it as desired for use.

The principal and largest of the storage reservoirs is the Eureka, or French Lake, a natural lake across whose outlet a dam has been raised, producing a reservoir of large capacity. The next is the Faucherie, lying about 600 feet below, and about two miles from the Eureka. The third and fourth are the Weaver Lake reservoirs, which are situated on one of the tributaries of Middle Yuba.

Of all these reservoirs, the French is the most important. It was originally a mountain lake of great depth, and contained a large body of clear water. A substantial dam, built of blocks of granite, with a facing of plank, was constructed across its outlet in 1858–59. This dam is about 250 feet long from bank to bank of the gorge in which it is built. Its base, measured along the course of the stream, is 89 feet; its height 68½ feet above the foundation, and 62 feet above the bottom of the outlet, which is an arched sluiceway, traversing the structure, the discharge being regulated by gates. The area of the reservoir, when full, is about 337 acres, and its estimated capacity 661,000,000 cubic feet.

The Faucherie reservoir forms an area of 139 acres, with an estimated capacity of 170,000,000 cubic feet. The Weaver Lake reservoirs also have large capacities for storing water for use in the summer season. The aqueducts, consisting of ditches, flume, or pipe, aggregating in length more than 200 miles, are capable of delivering at various points 8,800 miner's inches in wet weather, or 4,600 in dry weather, each inch amounting in 24 hours to 2,260 cubic feet. This company also have 16 smaller or distributing reservoirs at various points along the ridge. The cost of these reservoirs and aqueducts cannot be accurately ascertained, but it does not fall short of $1,250,000.

The average annual expenses of the company's ditch and water property is about $85,000. Considerable pains have been taken to show the vast outlay of money in opening and equipping these large mining properties, owing to the fact that public attention in California has been drawn to them so largely in the past two or three years.

ANOTHER GIGANTIC MINING SCHEME.—There are at present in Oroville, our former Congressman, the genial John K. Luttrell, and the eminent engineer, A. W. Von Schmidt. This is the gentleman who built the dry dock at Hunter's Point, who blew up Blossom Rock, and who drove off the robbers who stopped the Oroville and Quincy stage some years since. These gentlemen are there in the interest of a huge mining scheme, which contemplates the turning of Feather river, the mining of its bed for several miles, the mining of Carpenter's Flat to its bedrock, which has never yet been favored, and the establishment of a vast water power, sufficient to turn all the manufacturing machinery in the State, and supply Marysville, Sacramento, Stockton, San Francisco and intermediate towns with water. That is, they can do all that if they can build a dam that will stand the flood pressure of the Feather river. We have not heard the opinion of Mr. Von Schmidt on the proposition; but as he is an eminent engineer who has been successful in all that he has undertaken, we should regard it as practical, however doubtful it may be about its proving profitable as a mining operation. A dam to hold the waters of the Feather river will cost a large sum, and the question to be considered is whether sufficient can be realized to render the work profitable, after the practicability of the work has been decided upon.—*Butte Record.*

NEW MINING DECISION.—The Secretary of the Interior has decided in the case of the Rob Roy mineral lode, Helena, Montana, that where two applications are made, one of which has been abandoned, the ground in question comes within the purview of the second application, and is subject thereto. Previous to this decision, it has been held by the Department, in case of the abandonment of the land in controversy, the abandoned tract should revert to the public domain. In the case of the "Bobtail vs. the Caledonia," in Whitewood Mining District, Deadwood, Dakota Territory, the Secretary decides that after the claimant has obtained a judgment in his favor in a court of competent jurisdiction, he is at liberty to take the necessary steps pointed out by the statute to obtain a patent. He need not wait until the time for claiming an appeal to a higher court has expired. He may proceed subject to being again stayed by appeal; but if the appeal is taken the steps which he had taken subsequent to the judgment toward obtaining a patent are held to be valid, if he be finally successful in the higher courts.

MECHANICAL PROGRESS.

Heated Bearings.

A writer in an Eastern mechanical jouurnal says: "After all the reasons and causes for heated bearings, I believe that if they can be kept clean and free from dirt and dust, there would be less heating of bearings than there is. A bearing may run for months and be kept nice and cool, and all at once take a notion to heat and bother, after a general waking up has taken place by the parting of one of the main belts, and then be set in order by just cleaning out the bearing by taking off the cap and washing with soft soap. To cool a bearing, water made a little soapy will do very well, and in many cases is just the thing, where the dripping will not interfere with the machinery or belting. The use of plumbago or lamp black in oil I never placed any implicit faith in. I like to have a bearing heat after the box has been rebabbitted, just enough to glaze its surface a little, for then it seldom ever troubles, if it only lives through the first heating without injury; otherwise take apart the bearing and scrape the surface till an even pressure is brought to bear, and then try again. I like this using a little oil at a time from an oil cup that contains an oil that has got some body to it, and after it has been worn out, to fall into the drip pan for that purpose. When there is danger from heating, a piece of beef's tallow can be laid in the cap to melt and run into the box when heated from this cause. In taking down and replacing shafting or machinery of any kind, if the bearings are first thoroughly cleaned, when replaced, nine times out of ten they will not trouble, even though their caps have been rescrewed down too hard, or the whole force brought to bear upon some particular spot. It is astonishing how, in some places, a bearing will run all its lifetime without any trouble in the least, and perhaps where the whole strain of the main belt is brought to bear, while at the loose end of another shaft they have had more or less trouble from the very first. The lathe man's work may, in this case, have something to do with it; the file, instead of the cold water finish, may have taken the work out of round, and left the surface to jump and pound, and cut the bearings out. Heated hearings from any of these causes can only be found by careful examination. Bring a rest as near the shaft as possible, and see if it remains the same distance from the surface while revolving. If it does, it is all right at this point; then test in the same way on the other side, to see if the shaft is both circular and straight. By means of a lever and a short bearing for its fulcrum, the looseness of the shaft in its bearing is determined, and its mechanical defects rectified."

How to Recognize Good Wood.

Rankine says that there are certain appearances characteristic of good wood, to what class soever it belongs. In the same species of wood that specimen will in general be the strongest and most durable which has grown the slowest, as shown by the narrowness of the annular rings. The cellular tissue, as seen in the medullary rays (when visible), should be hard and compact. The vascular or fibrous tissue should adhere firmly together, and should show no wooliness at a freshly cut surface; nor should it clog the teeth of the saw with loose fibers. If the wood is colored, darkness of color is in general a sign of strength and durability. The freshly cut surface of the wood should be firm and shining, and should have somewhat of a translucent appearance. In wood of a given species the heavy specimens are in general the stronger and the more lasting. Among the resinous woods, those having the least resin in their pores, and among non-resinous woods those which have least sap or gum in them, are in general the strongest and most lasting. Timber should be free from such blemishes as "clefts," or cracks radiating from the center; "cup shapes," or cracks which partially separate one layer from another, "upsets," where the fibers have been crippled by compression, "wind galls," or wounds in a layer of wood, which have been covered and concealed by the growth of subsequent layers over them, and hollow or spongy places in the center or elsewhere, indicating the commencement of decay. *Manufacturer and Builder.*

A One-Wheeled Buggy.

A Chicago man has invented a single-wheeled carriage. The vehicle has shafts which are so fastened to the horse that it can neither tip nor upset unless the animal should fall. The seat and box are behind the wheel. The advantage claimed for this novel contrivance is, that it can be hauled on any path wide enough to accommodate a horse. The plain inference is, that as it will carry a load, it would be an admirable substitute for the pack-mule on mountain trails, where greater speed can be obtained on the descending grade, with the driver borne along in comfort. The public will have greater or less confidence in the invention, as the case may be, after witnessing its performance.—*N. Y. Tribune.*

In reference to the above, the *Call* of the 18th inst. contains the following:

"Having seen an article in the *Call*, taken from the Chicago *Tribune*, in regard to a one-wheeled buggy, let me say that in February, 1881, I saw a one-wheeled buggy in Cambria, San Luis Obispo county, which the inventor called a horse velocipede. So I think that California can claim the honor, if such there is, of the invention. It had strong shafts, with such fastening as would prevent its being turned over, unless the horse was thrown down. The seat was placed directly over the wheel. For further particulars, address Mr. Ira Van Gordon, Cambria, San Luis Obispo county. I am yours, respectfully, D. S. VAN SLYKE."

Wider Steel Rails Needed.

Mr. Reuben Wells, master mechanic of the Louisville and Nashville railroad, at the recent Master Mechanics' meeting, at Chicago, expressed himself as follows:

As regards the wear of wheels and rails, it is a question whether a wider top to the rail would not add proportionately to the durability of these parts. Within a few years we have largely increased the weight on the wheels, in some cases nearly doubled it, but have not widened the rail, and, as a consequence, we find the wear of both has been increased proportionately. If the part of the tread that now projects beyond the rail could also have a bearing upon the rail and carry its proportion of the load, the durability of the wheel, as regards the natural wear of its face or tread, would be increased as much, perhaps, as twenty per cent, with a proportionate increase in the durability of the rail.

The best shape for the flange and tread of the wheel and for the inner edge of the rail are questions about which there is much diversity of opinion among those best informed on the subject. Scarcely any two wheel manufacturers make the same shape of the flange and face of the wheel precisely alike, and there is no equal variation in the curve lines of the edge of the rails against which the flanges have their bearing.

These matters, it seems to me, are of sufficient importance to warrant a thorough investigation. We ought to know whether any improvement can be made or whether the present variety is as good in practice as uniformity would be.

ALLOYS of metals are often difficult to make, and very small quantities greatly affect alloys. The presence of 1-30000th of a pound of antimony in a pound of melted lead increases the rapidity with which the lead oxidizes and burns. Lead which contains more than 1-14000th of its weight of copper is unfit for the manufacture of white lead. *Der Techniker* says gold with an alloy of 1-2000th of lead is extremely brittle. Copper with ½ per cent of iron has only 40 per cent of the electric conductivity of pure copper. Nickel was regarded as a metal which could be neither rolled, hammered nor welded, until it was found that the addition of 1-1000th of magnesium, or of 3-1000th of phosphorus, makes it malleable. Some varieties of east steel are exceedingly brittle, but the addition of 1-12th of 1 per cent of magnesium makes them malleable. At the Paris Exposition of 1878, a great difference was found in the toughness of sheets which were made of Swedish puddled iron. The only difference which chemical analysis showed was that the good plates contained 20-100000ths, and the bad 21-100000ths, of phosphorus.

YELLOW PINE, hard finished in oil, is the rival in beauty of any wood that grows, not excepting the costliest hardwoods. It is susceptible of receiving and maintaining as high a degree of polish as any wood with which we are familiar, and as to durability, when thoroughly impregnated with oil, it may be said to be almost everlasting. In such a condition it is impervious to even hot grease and other substances that leave an ineffaceable stain upon white pine, maple, and various other woods. Flooring for use under carpets should be largely sap, and when exposed either for inside or outside use, should be as near all heart as possible. For inside trimming, wainscoting or panel work, the curly variety, which, by the way, can only be obtained in limited quantities, and ought to bring from $60 to $80 per thousand in any market, instead of only half that sum—is, in the writer's estimation at least, superior to either cherry or bird's eye maple.—*N. W. Lumberman.*

THE Indianapolis Wooden-Dish Co. has just perfected a new machine for making wooden dishes. This machine takes the veneer from the veneer mill, cuts out the blank, shapes and scores it, folds it up, and takes the wire from the spools forming the staple, drives the staple at each end of the dish, drives and clinches it, and throws the dishes off from the machine complete, at the rate of sixty per minute. The works have a capacity for turning out 200,000 wooden dishes per day.

COMPLICATED MACHINES.—A writer in an Eastern journal says: "The tendency to complicate machines and make them universal, or machines of many kinds, is fast becoming extinct. It has been usually found to be a very much more costly way to produce work than with special machines made for one kind of work, or at least not many kinds of work, and then only when they were similar in their processes and manner of production and operation.

A JOURNAL BOX slightly out of line or level will absorb a large amount of oil, and yet be continually hot, waste power by unnecessary friction, besides grinding and cutting the shaft. It will always pay to attend closely to such matters.

SCIENTIFIC PROGRESS.

Phenomena Attending a Total Solar Eclipse.

Those not familiar with the problem which astronomers are at present endeavoring to solve, have doubtless wondered why it was that scientific expeditions should be fitted out at great expense and dispatched to the uttermost parts of the earth for the purpose of directing their instruments of precision for a few minutes at the spectacle of the moon concealing the sun, although it may be admitted that such a phenomenon is, in itself, exceedingly interesting.

But the astronomers see much more than an impressive spectacle in a total eclipse of the sun. They know that the intense brilliancy of the luminous body of the sun renders it impossible to make observations of, or to gain any knowledge of his surroundings, and that these surroundings, in the highest degree interesting and wonderful, are only rendered visible when the vast floods of light emitted by the sun are cut off by the interposition of the dark body of the moon. The astonishing character of the solar atmosphere then stands revealed to the eye of the astronomer.

When the moon comes exactly between the earth and the sun, the whole of the intensely brilliant body of the sun which we ordinarily see is cut off from our view; but projecting beyond the edges of the black circle formed by the moon, objects that might be taken for red flames are seen. These flames, protuberances or prominences, as they are variously called, rarely show any flame-like motion, but in most cases remain unchanged in shape, until the returning sunlight, as the moon passes on, blots them from view. They exhibit a great diversity of striking and curious forms, resembling various trees, clouds, horns, tongues of flame, etc.; and although they appear small when compared with the size of the sun, their actual size is enormous, some being 50,000 or even 100,000 miles high, and proportionally broad.

A close inspection shows that these singular prominences rise out of a scarlet ring of light surrounding the whole hidden sun. This fiery ring, which is in reality a section of a spherical shell around the sun, is called the "sierra." With the aid of the spectroscope, with which—in improved forms—it has been possible to reveal the red prominences even when there is no eclipse, and in full sunshine, it has been demonstrated that the sierra is composed of glowing gases, among which hydrogen predominates.

These protuberances are eruptions of heated gas projected from the body of the sun; and astronomers have occasionally been fortunate enough to witness geyser-like eruptions of these gaseous meteors in the very act of eruption, the red columns of gas streaming upwards to the prodigious height of 100,000 or 200,000 miles within a few minutes. While, however, the sierra and the protuberances may be observed with the aid of the spectroscope when there is no eclipse, it is during a total eclipse, and especially during one of long duration—like that lately observed at Caroline island—that these wonderful objects can be observed and studied to the best advantage.

Beyond the sierra, also, there are other singular objects which can only be seen during an eclipse. There is, for example, a zone of silvery light surrounding the hidden sun outside the red disk of glowing gases, and these, radiating out in all directions to astonishing distances—sometimes to the distance of six or eight times the apparent diameter of the sun, corresponding to an actual distance of several millions of miles—are the splendid rays of the corona. These are generally of a silvery hue, and taper off at their extremities, gradually growing fainter as they recede from the sun, and making a most striking spectacle in the darkened heavens.

What these rays may be, and what part they play in the economy of the sun, are still among the problems that have baffled science to determine. That they are governed by some law intimately connected with the condition of the solar orb itself, is shown by the fact that they vary in appearance according as they are seen in periods of sun-spot maxima and minima. They extend to the greatest distances, and present the most complex and interesting phenomena at the sun-spot maxima when the sun is racked and rent by internal forces. *Builder.*

Concerning Sanitary Science.

The New York *Star*, in an able editorial, makes some assertions which must be startling to members of the profession who have been taking a Rip-Van-Winkle sleep during the last generation or two. We quote a few paragraphs: "One of the marked changes of our time is the altered position of the physician in the community. The traditional duty of the doctor is to cure disease, and disease was supposed to be a sort of malignant entity which had got into the system and could be expelled only by the most energetic and heroic remedies. Physicians were said to belong to the medical profession, as the chief business of the doctor was to prescribe medicines, which were mostly drugs. And Voltaire wittily summarized the work of the physician as an attempt to work a miracle by reconciling intemperance and health. A half century has altered the whole scope of medical study. Sanitary science profoundly affects medical theories. And the upshot of it all is that the old faith in drugs and medicines of all kinds is fast dissolving. People are everywhere learning that sunlight, pure air, good food, a proper dress, regular habits, plenty of sleep—in short, that right living is a million times better than all the medicines of the world.

"The great physicians of our times are vastly more interested in sanitary science and hygiene than in therapeutics. They are studying anew the questions pertaining to life. They are investigating the conditions of perfect physical existence. They are giving lectures and writing books on the great art of keeping well, of developing physical force, of building up a perfect body. The questions of drainage and ventilation, of the nutritive values of the different kinds of food and the proper methods of cooking, of artificial exercise when it is necessary to resort to such expedients, the heating of houses, and the quantity and fashion of clothes that should be worn—are assuming an importance hitherto unknown. Everything that relates to the art of living so as to avoid sickness and pain, and maintain the highest degree of power and enjoyment, is invested with new importance. The physician is no longer a medicine man. We send for him when ill, it is true, and value his curative services as highly as ever; but we would pay him a double fee to keep us well. He is a member of a health police, whose function it is to keep people from getting sick and hold disease at bay. And instead of killing a doctor when a patient dies, after the manner of the Emperor of China, the skill and proficiency of the physician of the future will be determined by his success in keeping his patients strong and well; and should they fall ill, he may be dismissed for a better one."

THE object glass for the great refracting telescope intended for the Russian observatory of Pulkowa, has been finished by the Messrs. Clark, of Cambridge, Mass., and is the largest glass thus far constructed. The order for the glass was given in 1881 by Prof. Struve, the director of the observatory, who has lately visited this country for the purpose of subjecting the glass to certain tests of its quality. These, it is said, proved to be in every way satisfactory, and the object glass is by this time on its way to its ultimate destination, if, indeed, it has not already arrived there. This great object glass is thirty inches in diameter. Pulkowa, however, will not be able to claim very long the distinction of having the largest refracting telescope in the world, for the great Lick telescope for California will have an object glass of thirty-six inches diameter, or six inches greater. Six inches appears a small addition, but it represents an enormous increase in power, for the light-gathering area of the Lick object glass will be to that of Pulkowa as 1,296 to 900, or forty per cent greater. The rough disk of the flint portion of the Lick glass has already been received by the Clarks, and they are at work upon it. It will be several years before it is finished.

THE KNOWN AND THE UNKNOWN.—The opinion is commonly expressed by those who are not well informed, that the world is so rapidly advancing in scientific discovery that a few years more of such extraordinary advancement as we have witnessed during the past quarter of a century, will practically exhaust the sources of discovery, and the scientist will sigh in vain for "new worlds to conquer." No opinion could, in reality, be more delusive than this. Each fresh discovery which discloses a secret that nature has so long and carefully guarded, illuminates with its feeble rays a background of other mysteries still unsolved, and so far from narrowing the field of discovery, widens the circle of the unknown and places its horizon still further off. He who thinks he has mastered a science is a superficial thinker. The profound thinker is he, who, having possessed himself of all the knowledge of his predecessors, perceives how little the sum of that knowledge is, in comparison with what still remains to be learned.

AMERICAN ASSOCIATION FOR ADVANCEMENT OF SCIENCE.—The thirty-second meeting of the American Association for the Advancement of Science will be held at Minneapolis, Minn., beginning August 15th, and closing August 21st next. Prof. C. A. Young, of Princeton, will preside. Information regarding transportation may be obtained by addressing Thos. Lowry, Esq., Minneapolis, Minn. All matters relating to membership, the presentation of papers, and business to come before the meeting will be attended to by F. W. Putnam, permanent Secretary, who may be addressed at Salem, Mass., up to August 8th, and afterward up to the close of the meeting, August 21st, at the Nicollet house, Minneapolis, Minn.

THE EARTH MORE RIGID THAN STEEL.—Prof. Sir W. Thomson, in his new treatise on natural philosophy, is led, by a consideration of the necessary order of cooling and consolidation of the earth, to infer that the interior of our world is not, as commonly supposed, all liquid, with a thin, solid crust of from 20 to 100 miles thick, but that it is on the whole more rigid than a continuous solid globe of glass of the same diameter, and probably more rigid than such a globe of steel.

THE Volta prize of $6,000 will be awarded by the Academy of Sciences, Paris, in December, 1887, under the decree of June 11, 1882, for the discovery or invention of whatever shall render electricity applicable economically to one of the following objects: Heat, light, chemical action, mechanical force, the transmission of messages, or the treatment of sick persons.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

ASSESSMENTS—STOCKS ON THE LISTS OF THE BOARDS.

A TERRIBLE earthquake shock occurred at Oporto, Italy, July 31st. Buildings were destroyed, and many thousands of lives are reported lost. One thousand are dead at Lucco, 1,000 at Fario, and 2,500 at Casamacciola. The damage to property is two million lire. Fifteen hundred tons of chloride of lime was used at Casamacciola during the day for deodorizing purposes, but the stench in the upper town is still unbearable.

THE extensive stables belonging to the Gordon House were burned to-day, July 31st, and two celebrated trotting horses, General Bramish and Highton, Jr., with several other valuable animals, perished; loss $15,000.

Mining Share Market.

The fluctuations in stocks during the week have been small. People seem to be awaiting developments, so the market is not a busy one. The brokers try to make a market, no doubt, but with small success of late. Up on the Comstock matters are going on as usual. At the Mexican they will soon make the connection between the upraise from the 2900 and the winze down from the 2700 level. They will then be able to explore the ore vein found above in the winze. The work of repairing the Central tunnel and the old Mexican shaft will now soon be completed, when a great amount of low grade ore may be cheaply extracted from the old upper works. Drifting has for a time been suspended on the 2500 level of the Best and Belcher and Gould and Curry. Some of the drifts are going into wet ground. At the Alta they are getting things in shape for pumping out the lower levels. This will require three or four months. The water now stands at the 1100 level, and between that and the 2150—the lowest level—there are at points some very long drifts; besides, the ground is about as thoroughly saturated with water as when the mine was first opened. By turning the water from the ranches up toward the head of the Carson river sufficient water will be obtained to run the mills to their full capacity. Thus all the miners may resume work and all go on as usual in the Yellow Jacket, Kentuck, Crown Point, Belcher and all the other mines.

Bullion Shipments.

Mt. Diablo, 23d, $7,628; Alhambra, 25th, $11,524; Northern Belle, 26th, $4,102; Bodie, 30th, $2,261; Standard, 30th, $14,004; Northern Belle, 30th, $7,369; Contention, 27th, $13,631; Crescent, 28th, $6,560; Horn Silver, 28th, $2,000; Horn Silver, 29th, $18,000.

CHOLERA is still raging at Alexandria. Eight deaths were reported July 31st.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alpine.

STELLA.—*Monitor-Argus*, July 20: The ore in the Stella mine, in Mogul district is improving as depth is attained. A portion is said to contain a a considerable amount of lead. The value of ore now taken out ranges from $100 to $300 per ton.

Amador.

INDIAN DIGGINGS.—*Ledger*, July 21: The working of the hydraulic mines of this vicinity will soon be brought to a close, as the water is drying up very fast. Hale and the Baughman Brothers will soon make a clean-up. Their claim is run day and night. The Oneto owned by Oliver Ball is running full blast. Charles Estey will soon go to drifting in his claim. Mr. Edner, of Brownsville, is getting some good pay dirt from his mine, and several other mines near Brownsville are paying handsomely.

SUTTER CREEK.—A large number of hands were discharged from the Mahoney on Saturday. Between 20 and 30 men are now employed in and about the mine. The cause of this reduction of the working force is that the rock from the open cut did not pay, and work there has been abandoned. A few stamps of the mill are now running on ore from the mine proper, and the rock is said to be of paying grade. At the Mahoney, the rock at the 900 level is getting more plentiful, and the upper levels also are looking favorable. The mill is now in fine condition. In a few days the dump will be full of ore, and the 40 stamps will be started. Sinking at the Con. Amador is progressing. A depth of 200 ft has been completed, leaving about 100 ft more to sink, when drifting will be in order.

OLETA.—The miners will go to drifting as soon as the water is shut off, and their claims—most of them at least—will pay a better profit. The miners are paying a heavy price for water to run their claims, 7½ cents per inch for a continuous head of water, and 12½ cents per inch for water to wash up drift dirt.

MAMMOTH.—All the machinery for the extensive tunnelling operations from the Mokelumne river is on the ground. The yield of the Yellowstone last month was largely in excess of any clean-up for many months past—about $30,000. The Bunker Hill last month yielded considerable over expenses. The second clean-up of the Loyal Lead was about $3,000—better than the first.

Calaveras.

WEST POINT.—*Chronicle*, July 28: Times are brightening up here and the prospects look encouraging. Our local blacksmith is kept busy repairing mining tools and machinery. All our teams and teamsters are engaged hauling ore to the crushing mills. The Valentine Co. have purchased the machinery from the Carlton. The Holmes' gravel claim, situated on the other side of the Mokelumne river, four miles from here, are running a bedrock tunnel for gravel. Lowery & Crockett, on Mill Creek, have struck a bonanza in their gravel claim. The gold is very coarse, averaging from 10 cents to $20 a chunk. Andrew Smith has commenced hauling rock to the Carson mill for McGee & Brown. The rock is said to average from $50 to $60 per ton. It is reported that extraordinary rich rock is being taken out of the Old Texas claim, on the Mokelumne river below the Lone Star. Davidson & McDonald are the principal owners. Mr. Desmond struck a body of ore in the Ohio Con. formerly known as the Woodhouse mine, which assays $1,000 per ton. So we are informed by responsible parties.

SKULL FLAT.—The Star of the West Company are negotiating with parties to put up a large quartz mill on their mine at Skull Flat. The ore is reported very rich, averaging from $100 to $150 per ton.

El Dorado.

ARMSTRONG AND ROBERTS.—*Democrat*, July 28: In cross drifts of about 300 ft on the main channel, the gravel that they took out of the bottom of the drift paid from $3 to $7 per day to the man. Near the mouth of this drift, in the bottom of the main tunnel, $15 were recently panned out of three panfuls of gravel. In all they have 650 ft in length of this channel on their ground. All this proves that there is more gold in old El Dorado than has ever been taken out. There are channels here to-day that are as rich as any worked in old times. They are not so easily got at it is true; sometimes they are covered with a lava cap 90 to 100 ft thick.

RICH STRIKE.—In the Morrell Con. mine, on the Cederberg belt, near Greenwood, a narrow vein of exceedingly rich ore was discovered about two weeks ago. This has been followed since in both the upper and lower tunnel, until a vein 18 inches wide has been developed, of ore that is considered reliable for at least $1000 per ton. Some of the men also worked on the old Cederberg at the time of the $50,000 strike and they pronounce the indications in this case better than at any stage in the development of the Cederberg. They have put up a rotary six-stamp mill near the mouth of the main tunnel.

THE SPRINGFIELD.—The new hoisting-works are being put up as rapidly as is compatible with the great weight of the timbers and machinery. The foundations are of the most substantial character, and the new works when completed will be the finest ever erected in this county.

ONION VALLEY.—Monday and Badger have struck a quartz vein in their claim, which prospects from $500 to $750 per ton. Jerry Saucerman is working a gulch a short distance west of the valley, which he bought about a year ago for $75. Last season he took out between $600 and $700, and this season he is doing even better, having taken out several nuggets weighing from $4 to $11.

Kern.

KERNVILLE.—*Californian*, July 28: The Big Blue Lead, owned by the Summer, will soon develop into one of the great bonanza mines of this coast. Hitherto the work of extracting ore has been conducted near the surface, the expensive work of pumping being desirable to avoid; but in the meantime a tunnel for drainage and other purposes was started from the river. This has recently been completed striking the vein 200 ft below water level leading into the river a constant stream of 40 inches of water and leaving, above it, a vast mass of ore 60 ft in width, some of it very rich. The tunnel also drains several smaller veins lying to the west of the Big Blue and nearly parallel with it. On one of these, Lady Belle, work is actively prosecuted and great quantities of rich ore brought to the surface. It is claimed that in one part a hundred tons of ore is in sight that pays at the rate of $400 per ton.

Mariposa.

THE FREMONT GRANT.—*Herald*, July 27: From Bear Valley to the Benton mills, little is to be seen save the dumps of the various mines and tunnels with locked doors. An air of desolation and decay pervaded the entire hill. Cars, machinery, track-iron, and other expensive and necessary articles for mining purposes, were scattered promiscuously around to rust, rot, and fall to pieces.

Modoc.

HAYDEN HILL.—Adin *Argus*, July 26: On Wednesday, the 18th, another rich strike was made in the Juniper mine, Hayden Hill. The new strike is on the 90 level, and is also tapped on the 60 level. The vein is 15 inches wide. A large amount of dirt will, it is reported, yield $5 to the pound. It is stated that one man is getting out $2,000 per day. Very rich dirt has been found in this mine heretofore, but what makes the present strike so valuable is the extent as well as the richness of the lead. Juniper mine has heretofore been valued at $600,000 but that would not approach toward buying it to-day. But Juniper is not alone. Harbert Bros. in running a crosscut from their main shaft, 135 ft below the surface, have struck an extensive body of ore which runs from $25 to $40 per ton. They are putting their quartz mill in order preparatory to making a run. The Golden Eagle mine, Hopkins, Nash & Co. proprietors, has also struck a ledge three ft wide, with well defined walls. Among other names we hear mentioned in connection with the present "boom" at Hayden Hill, are Richie & Dunbar. They have taken out from 50 to 60 tons of fine ore, and are milling the same at the Hocs mill.

Mono.

STANDARD CON.—Bodie *Free Press*, July 25: During the week ending July 21st there was shipped to the mills 1452 tons of ore; received 1935 ounces of crude bullion and shipped to the company $14,316. The east crosscut, 1200 level, is in 400 ft. The progress during the week, 22 ft.

BODIE CON.—During the week 135.135 tons of ore was sent to the mill, and 147 tons crushed. The shipment of bullion amounts to $3,140.30. During the week ending July 21st the west crosscut from the north drift, 700 level, was advanced 11 ft; total length 359 ft. The ground is very hard.

NOTES.—Homer *Index*, July 21: The Summers mill at Sweetwater is crushing 13 tons of ore per day, the ore being chiefly from the bottom of the winze, over 500 ft beneath the surface, and it gives the average yield of $127 to the ton. The furnace of the Detroit Copper Co. in Jordan district is running steadily. Paul Rouze is packing good ore from the Rocky Point and Gold Band mines to his Lake canyon arastra. Erwin and Drew are taking some rich ore from the Clifton mine and having it packed to the Hearne arastra below Lake Lundy. The Gorilla mine, tramway and reduction works are being run steadily, and everything is working smoothly. The high mountains of Tioga district are alive with prospectors.

GREGORY FLAT.—Aurora *Herald*, July 21: The Silver Hill mill, was started up this morning. The machinery has all been overhauled and put in first-class condition. Considerable ore is on hand.

Nevada.

LONE TREE.—*Tidings:* The recent strikes in the Hartery and the Perrin, have given stimulus to the mining interests, and shortly the Con. Lone Tree will resume work. The property is at Forest Springs and is a location of 3,000 ft, embracing three separate ledges, one of them 2½ ft thick, and the others averaging eight inches. Pan washings yielded from $2.50 to $15 to the pan, and much of the gold was in large lumps. About $9,000 have already been expended on the property.

NEVADA CITY.—*Transcript*, July 29: A couple of days ago another bunch of specimen ore was found in the 600 level of the Nevada City mine. The pieces taken out so far are very rich in free gold.

NOTES.—*Mountain Echo* July 25: The Gold Hill mine is still turning out gold in abundance. The Confidence mill is nearly ready for operation. The forty stamp mill in course of construction at Carson's is nearly completed. The reports from Murphy's regarding the mining interest in that section have not been more flattering for years. Work is progressing on the Lindsay mine, the shaft being one hundred ft deep. A Mexican, while on his way from Vallecito a couple of weeks ago, found a chispa near Seven-pound Gulch, valued at $56. The Black Oak mine, owned by Wm. Osborn, and located 2½ miles northwest of Angels, is being worked and the lead is becoming richer. The Uno mine, in Nassau Valley, worked by Sylvester & Co., is looking well. The shaft is 40 ft deep, and the vein two ft in width. The average yield of the ore is $15 per ton. Work is progressing rapidly in the Marshall mine. The shaft has reached a depth of two hundred ft. The machinery recently erected on the Porter mine, works splendidly. The ore body is nearly fifty feet in width, the richer part however, being only about ten feet.

San Bernardino.

LAVA BEDS.—Calico *Print*, July 21: The Meteor is being opened by a tunnel and is looking splendid. The Morning Star has a tunnel in 75 ft and a shaft is being sunk from the croppings to connect with it. Some fine ore has been taken out of the ledge. Mr. J. H. Roberts suspends the work. The Mammoth Chief, is showing up excellently. A shaft has been sunk 35 ft, which is uncovering a broad vein of ore that is getting wider.

BLACKFOOT.—Work is progressing with favorable results. An incline shaft has been sunk twenty-four feet, in the center of an open cut fifty feet in length. It is estimated that the body of ore is at least 100 ft wide. About ten tons have been shipped to San Francisco, and there are fifteen tons on the dump.

BISMARK.—Work is progressing with a small force of men. The ore taken out recently is richer than usual. Last Monday twenty tons were crushed at the Oriental mill. There is a good deal of ore in sight.

San Diego.

COPPER.—Los Angeles *Times*, July 21: Mr.

Cheesebrough has some specimens from a mine sixteen miles from Yuma, on the California side, and only three miles from the railroad. The specimens are rich in copper and horn silver, with some free gold, an assay showing the following result to the ton: Copper, 45 per cent.; silver, fifty-seven ounces; gold, $10. The above may be considered a fair average of the ledge. The ledge is from four to six feet wide and well defined.

Shasta.

IGO. Cor. *Courier*, July 28: The South Fork arastras are all running on very fair ore. The Hardscrabble mine has suspended work for this season. They had a good clean-up. Quite a number of the Chinamen who were at work on the railroad have returned and gone to mining again.

Sierra.

GIBSONVILLE.—*Messenger*, July 21: The Nevada Hydraulic M. Co., of Gibsonville, a few days since unearthed a round quartz boulder perfectly plugged with gold. It panned $2,228—leaving some choice pieces for the lapidaries, which will swell the gross value to $2,500. It weighed 160 pounds.

FOREST CITY.—*Tribune*, July 26: The gravel that comes out of the South Fork ground at Forest City seems to be improving every day. One hundred and eighty-six ounces of gold was what the Extension Co. realized from the last seven days' work.

FOUR HILL MINE.—The Four Hill mine continues to look fine. Our informant says there is an abundant supply of ore in the mine fairly glittering with gold. The company will start a tunnel several hundred ft below the present one.

RAINBOW. A clean-up of $37,000 was made in the mill last Saturday after a run of three weeks with the 10 stamps. Surveyor Spaulding, of Forest City, commenced making the survey for the new tunnel this week. This will tap the ledge 360 ft below the present workings. It will require one year's time to finish the work, at an estimated cost of $30,000.

Butte *Record*, July 28: G. W. Cox, J. M. Williams and F. Becker, of the Union Co. of Howland Flat and St. Louis, and F. A. Gourley and J. P. De Moore, of the Union Ditch and Nevada Co. arrived in Oroville Monday, having with them three hundred and fifty pounds of gold dust, the result of the season's work of the above-named companies. The value of the gold dust is about $105,000. The parties left Oroville on Tuesday for San Francisco, to deliver it at the Mint.

Tuolumne.

LAMPLIGHT.—Sonora *Democrat*, July 28: The hoisting works on the Lamplight mine, at Confidence were entirely destroyed by fire on Tuesday. The shed, entire hoisting works and timbering for six lengths in the shaft were burned. Fortunately the shaft beyond, which was ventilated from an old tunnel enabled the miners to save the lower portion. The loss will exceed $3,000, insured for $1,500. Delay in opening the mine amounts to more than the actual loss.

NEVADA.

Washoe District.

Virginia *Chronicle*, July 25: Last evening the fires in the furnaces at the Crown Point were allowed to cool and the mine practically shut down. This is a severe blow to Gold Hill, but could not be averted. Supt. Jones bitterly regretted the condition of affairs, and extended his sympathies to the men thrown out of employment. The draft lets out about 140 miners and top hands. It is expected that a few will be put to work next Saturday to put things in shape. It is probable that the Yellow Jacket will also reduce its force soon on the same account—the scarcity of water in the river—which renders it impossible to crush one-quarter the former quantity of rock.

UNION CON.—*Enterprise*, July 28: Have completed repairs on the joint Mexican winzes from the 1800 to the 2300 level. The joint Sierra Nevada west crosscut on the 3000 level is in 68 ft beyond the east side of the 30 ft vein. During the week passed through a vein of milling ore seven ft thick.

SIERRA NEVADA.—North lateral drift No. 1 on the 2000 level has been extended 26 ft. On the 3000 level the joint Union Con. west drift cut seven ft of milling ore during the week.

MEXICAN.—Good headway is made in the raise from the 2600 level, notwithstanding that the rock is hard. The north drift on the 3100 level is steadily pushed forward.

YELLOW JACKET.—Explorations show a sufficient amount of low grade ore to last for some years.

THE CROWN POINT.—The miners will now be put to work again, as arrangements have been made for turning sufficient water back into the channel from the ranches up toward the head of the Carson river to start up all the mills to their full capacity.

ALTA.—Drain boxes are being placed in the drift leading out to the Sutro tunnel on the 1030 level and a pump tank is being constructed in the shaft at the same level.

HALE AND NORCROSS.—The connection between the upraise from the 2600 and the winze down from the 2100 level has been enlarged to the full size of the winze.

CALIFORNIA.—Have completed cutting out the tank station at the 2800 level in the C. and C. winze, and sinking to the 2900 level has been resumed. On the 2700 level the south drift has been advanced 15 ft.

OPHIR.—The repairs to the old Central tunnel and Mexican shaft are about completed. The tunnel enters the old works about 150 ft below the surface. Ore is still being extracted from the croppings.

CON. VIRGINIA.—The cutting out of the tank station at the 2800 level in the C. and C. winze has been completed, and sinking to the 2900 level resumed. On the 2700 level have completed a south drift.

GOULD AND CURRY.—Have discontinued work in the drifts for four or five days to allow the water to drain out. The pump at the Osbiston shaft is kept running.

SAVAGE.—The Hale and Norcross air connection being completed work will soon be resumed.

UTAH.—The drain pipe is all in place, and the water passing through it to the Sutro tunnel.

ANDES.—The west drift is in promising material, and low grade ore is being extracted.

BELCHER. As the mills are to be started up again on the river, all will doubtless go ahead as usual in the way of extracting ore.

CHOLLAR.—Will soon resume prospecting now that the air connection has been made in the Hale and Norcross.

BEST AND BELCHER. Have suspended work in the drifts on the 2500 level for a few days to allow the water to drain off.

UNION SHAFT. Are repairing the 1600 drain tunnel and 2300 station.

Candelaria District.

NORTHERN BELLE.—Owing to the extreme heat the southwest drift on the fifth shaft level has been extended only six ft during the week, making a total length of 163 ft. The face is in a ledge of hard sulphurets giving assays from $16 to $28 per ton. The stopes above the first level are turning out ore of very good grade. Everything is moving along satisfactorily about the mine, and the daily shipment of ore to the mills has been about 60 tons. Both mills are running and with good results. A bullion shipment of $10,045.86 was made on the 26th instant, making the total for July account $37,122.86.

MOUNT DIABLO.—The stope near winze No. 1, and below the third level, shows some 18 inches of $80 ore. The stope from lower winze No. 2 is giving some $50 ore from a narrow ledge. The stope below the third level, near the head of winze No. 2, shows 2½ ft of $90 ore. A small amount of ore of good grade is being taken from the third level. The intermediate stope, is giving a small amount of $120 ore. The east drift on the second level is yielding some $70 ore from narrow streaks. A small amount of $100 ore is being extracted from several places in the first level. A shipment was made on the 19th inst. of $6,124.19, and another on the 23d of $7,625.35.

Ploche District.

EL DORADO. *Record*, July 21: Mining at El Dorado Canyon is very active at present. The mill of the Southwestern company has shipped many thousand dollars in bullion since the mill first dropped stamps this run. The Techatticup mine keeps on yielding its usual quantity of high grade ore. The mines in the canyon are all looking well, and several of those owned by Cronin & Co. are valuable property. The chloriders are doing well.

TAYLOR DISTRICT. Dea. Shier, who has been on a trip to Taylor, reports the appearance about that place as being lively. There are about ninety men to work and several buildings under construction. The deepest mine in the district is not eighty feet.

Safford District.

ONONDAGA.—Eureka *Sentinel*, July 25: The Onondaga never looked better. The tunnel is now in a distance of 162 ft with the breast in high grade ore; crosscut south from tunnel 48 ft, with vein matter still in the face, showing a width of ledge over 48 ft at that point. The crosscut is started 72 ft from the mouth of the tunnel. The Zanoli is opening up a fine body of ore on the 80 foot level. Every blast develops some encouraging feature.

BANNER.—*World*, July 20: The Banner mill started up the other day with 15 stamps. The assaying is better than ever before, running from 109 to 113 ounces. They are employing at present 45 men.

NORTH STAR.—Wood river *Times*, July 25: J. O. Swift reports the North Star ore bodies opening up so well that he has ordered concentrating works which will be here in two or three weeks, and it will not require over a week thereafter to start up the works. The mine is yielding ten tons of ore per day, half of which is first-class and sold as it comes from the vein. The balance is left on the dump to await the concentrating works. Some 25 men are now employed. The works will be located about a mile from the mine.

BULLION GULCH.—From the mouth of Bullion gulch over the divide and down Narrow Gauge gulch is all activity—mining, building and prosperity. On the Narrow Gauge mines, men are building houses, mining, hauling lumber, carpentering, etc., and the prospects are good for a rival town to Bullion. The new metropolis is known as Orado.

ATLANTA.—*Statesman*, July 24: In the Monarch mine, the great ore chimney found on the surface and worked to the 200 ft level, yielded first-class ore to the value of $1,400,000, 1,000 tons of which sold in Omaha for $1,000 per ton. Besides this, there was a vast accumulation of low grade ore, which has remained in the dump, awaiting cheaper methods of reduction. Since the yield from these upper levels, the 300 and 400 ft levels have been opened, showing the same ore bodies.

Tuscarora District.

NAVAJO.—*Times-Review*, July 26: Total depth of shaft, 975 ft; progress 15 ft. Will have the sump completed this week. South drift, 450 level, extended 9 ft; total length, 324 ft. South drift, east lateral vein, 350 level, advanced 18 ft. Removing the old boilers, and the same will be converted into air receivers.

GRAND PRIZE AND ARGENTA.—Work has been resumed in the 300 and 400 levels of Grand Prize and the 300 level east of Argenta. The ledge in the drift going south in Grand Prize on the 400 level is improving.

ELKO CON.—Good progress has been made in timbering shaft No. 2. A section of the building for hoisting works is nearly complete, and all of the machinery has been placed in position.

INDEPENDENCE.—Good progress has been made with the work during the past week. Length of drift north, 300 level, 626 ft; progress, 20 ft. South drift, 400 level, extended 9 ft. Total length, 856 ft.

BELLE ISLE.—Total length of drift north, 450 level, 117 ft; progress, 11 ft. No change in the formation. No. 1 drift north, 350 level, advanced 18 ft; No. 2 drift, 13 ft.

NORTH BELLE ISLE.—The usual progress has been made in extending the drift south on the 300 level.

White Pine District.

TAYLOR.—Eureka *Sentinel*, July 24: We are indebted to Mr. Ferguson for some fine specimens from Taylor. Two are from the Monitor mine, and show richness in horn silver. The Monitor has a ten-stamp mill, run by water. The Argus mine is to have a 20-stamp mill. Mr. Ferguson says there is a quantity of low grade ore in the district that can not be estimated. He never saw the like before.

ARIZONA.

PIONEER.—Globe *Chronicle*, July 21: The first shipment of bullion from the Howard 10-stamp mill was made on the 18th. The shipment was 20 bars less than three weeks run. The Pioneer mine is turning out several bars regularly each week. The shipments of the Old Dominion Co. the past week were 23 bars—8097 lbs. Total shipments to date, 3,702,527 lbs. Furnace No. 2 is running steadily. A large quantity of coke is arriving and another furnace will shortly be started. The Kane mine owners had some ore worked at the Isabella mill, the product of which was phenomenal. The first worked $1,496.40 per ton; the second class $328.95 and the third class $112.23. Not long ago a batch of 20 tons from this mine worked at the Stonewall Jackson mill, yielded $541.80 to the ton.

THE ONE HUNDRED AND ONE.—Prescott *Miner*, July 20: Yesterday, George Burton and Wm. H. Davis, late foreman of the Vulture and one of the best judges of mineral in the country, visited the bonanza and the best prospects he had seen in Northern Arizona. They pay streak is full five ft wide and works by arastra process over $40 to the ton. The mine is owned by Burton, Nolan & Vanderbilt.

MINERAL PARK. *Alta Arizona*, July 21: R. D. Hamilton in Todd basin is taking out some very rich ore. Ed. Smith's newly discovered silver mine in Todd basin has a six inch ledge that runs $125 to the ton. The New London at Todd basin is down over 100 ft. They are still taking out high grade ore. The Cupel M. Co. of Stockton, are to deliver 20 tons of high grade ore to Chamberlain's sampling works at Kingman. The Rain Bow mine at Todd basin has four different openings carrying gold, silver and galena. J. C. Asbury and Tobe Wilkerson made a trip to their new discovery on the west side of the Black range, this week. They claim the ledge shows on top of the ground for 2,000 ft. They have had three assays made which gave round numbers $135, $175 and $400.

COLORADO.

CENTRAL CITY.—*Register-Call.*—July 20: Two loads of mill dirt taken out of the Shamrock lode, owned by James P. Agnew, James Bosanko and others, sent to the Randolph mill in Black Hawk, yielded four ounces of gold—equal to eight ounces per cord. Prof. Tyler made an assay from the smelting ore being taken out, which gave 32.22 ounces gold, and 14.01 ounces silver per ton, having an assay value of $656.85 and a market value of $607.09 per ton. There was left at the First National bank last Tuesday 114 ounces of Perigo gold retort, the product of 31 stamps of less than a two weeks' run. A cord of ore treated at the New York mill in Black Hawk from the Free American mine on Caledonia mountain, Hawkeye district, yielded eight ounces and eight pennyweights gold. The quartz and dirt came from a depth of about 17 feet. This is an average of the crevice matter which is fully eighteen inches in width. The gold brought at the First National bank, this city, $17.25 per ounce. The lessees of the Independent lode, property of Thomas H. Potter and W. H. Cheatley, are taking out surface quartz which carries considerable galena. An assay made a few days ago gave 10 ounces gold per ton.

CAMP CLIFFORD.—Mr. Young, who has been driving an adit on the Jenny Lind lode, has cut into a twenty inch vein of almost solid mineral—galena gray copper, which contains considerable ruby silver. All miners who have visited it consider it the most important strike that has been made in that camp for the past twelve months. The adit has been run a distance of over 210 feet from its entrance.

UTE CREEK.—*Courier*, July 19: The Andes Co. have resumed work. At present they are drifting. As soon as the surface water disappears the shaft will be sunk 100 feet. They have seven inches of ore that mills from 300 to 400 ounces per ton. Redd & Bell have a new discovery near the Humboldt, the ore from which assays up in the hundreds. Work on the Wallace has been suspended on account of water. The shaft will be sunk deeper as soon as water will permit. Work is to be resumed soon on the Financier.

FREELAND.—*Courier*, July 26: The gross value of coarse ore shipped by this mine during the month of June was $21,393.12; the gross value of concentrates $13,382.44; a total of $34,775.56. The expenses for the month were $7,747.50.

EAST LEXINGTON. We were shown $46 worth of gold retort by Mr. Meade, of Idaho springs, taken from 1500 pounds of second class ore from the East Lexington lode, Soda creek. The first-class ore mills nearly 22 ounces gold and 29 ounces silver per ton at Golden, and nets the owners $440 per ton. The developments consist of 125 ft of surface workings, and a 28-ft shaft.

IDAHO.

WOOD RIVER. *Times*, July 18: Bullion camp never was as prosperous as now. The jigger is not yet done. The concentrator will be running in 10 days when 50 additional miners will be employed. The Idahoan jigger below town will be finished in 20 days, and another 50 miners placed at work. The ore chutes are holding out to the lowest level; one vein is seven ft wide, and widening, and over $500,000 worth of ore in sight. Within 30 days the hoisting works of the Eureka will be completed, and an additional number of miners put to work. Timothy O'Leary has uncovered a fine body of ore in the Snake River View mine. It is between the Mountain View and Ellen Stilts mines, on the southwest slope of Bullion hill. Barney Quigg has it richer and larger in the Mountain View, and is determined to sink 400 ft more on the vein. He has 78 inches of 700 ounce ore. The mountain View is on the divide of the Bullion hill, adjoining the Rising Sun and the Snake River View mines.

VIENNA.—The strike is a five ft ore body averaging 150 ounces in silver to the ton. Captain James Black has just returned from Vienna. Captain Black and John Congdon, will soon be millionaires. Jos. Reiley, of Vienna, has a big prospect not far from the Solace mine and is developing it. The ore assays into the thousands.

ATLANTA.—Major W. H. Pettit, of the Atlanta M. Co., reports quite a boom. There are probably 200 men at work in town and in the immediate vicinity, two mills of 20 stamps each are going up and a good deal of building is going on. The mine is opening up splendidly, the ore chimney found above having been cut on the 300 and 400 levels. From the surface to the 200 level this mine yielded $1,400,000 of first-class ore, 1,000 tons of which sold in Omaha for $1,000 per ton. At present, in addition to the low grade ore reserves in the upper levels, there is a large body of ore in the three lower levels, and the vein is over 80 ft wide in places.

MONTANA.

TIDAL WAVE.—Butte *Miner*, July 18: Ten men are now at work on the smelter going up on Wisconsin gulch. Mr. Jones is putting up the smelter. The gold mill erected by Noah Armstrong is having a steady run on ore from the Two Dams and Melrose leads. The first day's run they cleaned up over one pound of gold. It is reported that Gideon & Root have consummated a sale of the Tidal Wave mine, for $40,000, and McCormick & Co., are the purchasers. Capitalists from Salt Lake and California are looking over the district. Everything seems lively. Ore found in this camp assays as high as $6,000 per ton.

PHILLIPSBURG.—Butte *Miner*, July 21: This town is coming to the front with some of the finest bullion shipment ever made through the Pacific Express office in this city; 24 bars from the Granite mountain valued at $48,624, and 10 bars from the Hope valued at $12,768 passed through yesterday. Reports indicate that the Phillipsburg district, in which little work has been done for some years is having a genuine boom. This is owing to the recent developments on the Granite mountains in tunnel No. 2. The tunnel has a length of more than 1,000 ft. The pay ore was first encountered at a distance from the face of about 900 ft, from which point the ore has preserved a width of three ft, increasing to five, for a length of 130 ft.

EAGLE ROCK.—Butte *Miner*, July 18: High water in Snake river has somewhat interfered with mining. The sluice boxes have been temporarily removed, but are replaced, as the water subsides. Two new companies are beginning work. One is making a ditch on the west side of the river. A number of gentlemen from Chicago will be at Eagle Rock this week. They come on the part of the St. Paul Placer M. Co., made up of men of large capital—mostly residents of Chicago and St. Paul.

NEW MEXICO.

FLEMING DISTRICT.—*Southwest Sentinel*, July 18: The Hermosillo, Quartzite and Round Top are three claims in Fleming district, a short distance to the southeast of the Penroze Bonanza. The owners now have an open cut about 20 ft long and 4 ft wide; run in on a contact of lime and quartzite; and the breast of the cut, which is 12 ft high, is in ore which runs 211 ounces to the ton. Jno. R. Magruder shipped some 10 tons of lead an silver bullion, last Monday. It is the first shipment from the smelter of the Southwestern Co., at Ivanhoe.

MONTEZUMA.—Teams are hauling ore from the Montezuma mine in Cook's range, to the Ivanhoe smelter at San Jose. The ore averages 40% in lead, and is the best flux yet found in southern New Mexico. There are about 1,000 tons on the dumps, and fully 3,000 tons more blocked out in the mine, which can be raised for 50 cents per ton. Aside from its fluxing qualities the ore runs about 10 ounces in silver to the ton.

GEORGETOWN.—The McGregor mine at Georgetown, shows no signs of giving out. The drift, which is 10 by 12 ft face, is now in 15 ft, with an unbroken body of ore on both sides and at the top. The amount in actual sight is estimated at fully 200 tons. From the roof of the drift to the next level above, is just five ft, and this is known to consist entirely of ore—of very high grade—fully 150 ounces to the ton.

OLD MAN MINE.—As work progresses it becomes more and more clearly established that the value of the Old Man mine is in its low grade ore rather than the enormously rich deposits which were first opened up on its surface. That the mine has a permanent body of this low grade ore, running from 70 to 80 ounces, no experienced miner can doubt.

CHLORIDE.—Las Vegas *Gazette*, July 18: There are only one or two claims in the vicinity of Chloride that are being worked at the present time. Men are working on the Silver Monument about 14 miles away, and are down 80 ft and in good paying rock. The Buffum is working four men. They are down 135 ft in ore all the way, which has given 100 ounces as an average. The rest of the mines are lying idle for lack of capital. The Santa Rita is idle, pending negotiations with the English syndicate which is arranging to purchase the property. The price asked for the 46 patented claims is $6,000,000. John A. Miller has had returns from a shipments of ore from the Columbia mine, at Lake Valley. The first grade averaged 1840 ounces; second grade 616 ounces; third grade 131 ounces. About five tons per day is now being taken out. Work is progressing on the Struby and Emporia, which with the Columbia comprise Sierra Bella group.

KINGSTON.—*Tribune*, July 26: The Hardscrabble mine in Socorro county has been sold for $125,000. The North Homestake, at Baxter gulch, shows a fine lead of milling rock in a 12-ft shaft of 50 inches from top to bottom. The Midnight mine, Magdalena mountains, has a wide vein carrying ore that runs from 30 to 40 ounces in silver. A 25-ft shaft at the interseetion of the Pinon and Pinon Extension mines, Magdalena mountains, has exposed a four-ft streak of ore assaying from 50 to 500 ounces in silver. The Pueblo Spring mine, shows at a depth of 48 ft, an 8-ft vein. The mineral is argentiferous galena, yielding 100 ounces in silver and 50% lead. Col. Hutchason brought in yesterday a sackful of magnificent ore from the Lookout mine in the Magdalenas, which was struck in a 30-ft tunnel. It very much resembles the Lake Valley ore, and samples ran 500 ounces in silver. Word was received in Albuquerque on the 23d, that another very rich strike had been made in the Homestake mine.

OREGON.

BAKER CITY.—*Tribune*, July 17: Messrs. Rockfellow and Travillion had Mr. Foster's assissant at work surveying their quartz mine, on Sutton creek, 15 miles from town, on Saturday. Assays of the ore show it to be rich. No great amount of prospecting has been done as yet, but enough rock has been laid bare to show the ledge to be large and valuable.

Working Ore at the Manhattan Mill.

From the Austin correspondence of the Virginia *Enterprise* we take the following:

For nearly nine months the Manhattan mill has been running almost continuously, and the present run will be recorded as the longest it has ever made. Being the only working mill in the district, all the ore produced from the mines of Austin and vicinity are brought to it for reduction, and some lots even come from a considerable distance, Jefferson canyon, for instance, seventy-five miles away. It is a dry-crushing, twenty-stamp mill, and works the ores by the Stedefeldt process. Each of the twenty stamps weighs 1,000 pounds, and strikes nearly 100 blows a minute, making the dust fly at an extremely lively rate. When so many separate lots of ore are brought in from the various mines and localities for working, a very complete and careful system is called into requisition to keep them separate from each other until they have got through the batteries. And this is done very effectually and satisfactorily. The twenty stamps are arranged in four batteries of five stamps each, working side by side, thus allowing four separate and distinct lots of ore to be milled at one and the same time, if required. By frequent sampling of the pulp, as it passes through the battery screens in the shape of a dry powder as fine as flour, the assay value of each separate lot is ascertained and its bullion yield determined. Thus each battery can be run on separate and independent lots or ore, or all four be employed on a single large lot. After passing the batteries, however, separate working ceases, the pulp being carried forward collectively through the rest of the process.

Chlorination.

From the batteries the pulp passes forward to where a small two-stamp battery supplies it with pulverized salt, and it is mechanically mixed therewith to the extent of ten per cent, more or less, according to the richness of the ore, the richest ore requiring the most salt. Thence it passes through an elevator to the top of the roasting furnace, which is forty-eight feet high, substantially constructed of brick. Here it is discharged upon screens placed directly on top of the chimney-like furnace, and these screens, mechanically moving past each other, allow the pulp to sift and drop evenly down through forty-eight feet of fire flame to the bottom. This is a decidedly hot fire, created by two charcoal furnaces, on opposite sides, near the base. The heaviest and principal portion of the pulp dropping down through this column of fire, experiences the chlorination process in so doing, and falls in a red-hot pile at the bottom, changed from its sulphuret character to a chloride. Thence it is drawn or hoed ont through a small door, every hour, for transfer to the pan and amalgamation department.

Flue Dust.

Altbough, as before remarked, the heaviest and principal portion of the pulp drops to the bottom of the furnace, a considerable and valuable portion is carried elsewhere by the force and draft of the flaming furnace. The flue turns just beneath the pulp screen, at the top, and passes downward and backward through a series of dust chambers, contained in a substantial brick structure, seventy feet long by sixteen wide and ten or twelve feet high. There are sixteen of these chambers or compartments, and the flame and heat of the furnace, laden with its light, rich ore dust, passes zigzag through the entire series, and thence through outside passages to a huge brick chimney, eighty-five feet high, which finally carries the heat and smoke to join the general atmosphere, the distance thus intrinsically traversed by it from the furnace being over 500 feet. This, of course, is to give the pulp a chance to settle. Through convenient doors in the dust chambers and passages, their captured pulp is drawn out once a month and taken to the pans. And it furnishes the finest of the bullion. This Stedefelt furnace was the second erected in the State, the first being at the Auburn mill, near Reno.

The Pan Department.

From the furnace, the chlorinated and chloridized pulp, after being cooled somewhat, is run on cars into the pan room, near by. This department contains eight pans with a settler to each. The pans are five feet in diameter by two and a half feet deep, and are simply plain pans, with wooden sides and iron bottoms, and provided with the usual style of mullers, making about seventy revolutions a minute. The settlers are similar in style, six feet in diameter, with wooden mullers or agitators, making twelve revolutions a minute. Each pan works a ton at a charge, occupying eight hours for each charge, or three charges every twenty-four hours. About 600 pounds of quicksilver are used to each charge, and even up to 1,000 or more, in case the ore is unusually rich. More or less salt, as required, is also used in the pans, together with cyanide of potassium, scraps, and borings of iron and other desirable chemical agents. The amalgam is all placed in a large and very substantial cast-iron steamer, and the surplus quicksilver very speedily forced out of it by hydraulic pressure. The

Retorting and Melting

Department, which adjoins the pan room, is very conveniently managed, and certainly gives very gratifying results. It contains three large retorts and two melting furnaces, and every day or two, according to the richness of the ore worked, turns out a shipment of ten nice bricks of silver bullion worth a thousand dollars each. Charles Durning is superintendent of the mill, and has been for many years, having been an active and respected resident of Austin since 1864. It keeps him pretty busy looking ont for the different departments of the institution under his charge, but he is fully equal to the task, and understands his business.

The Motive Power

Running the entire mill, as well as furnishing requisite power to the machine shop and some other outside arrangements, is supplied by one of the best and most effective steam engines in this section. It is a Putnam valve horizontal engine with eighteen-inch cylinder and forty-two-inch stroke, rated at 140 horse power. The fly wheel is eighteen feet in diameter, and weighs 14,000 pounds. This engine is from the Union Iron Works, San Francisco, and with its bed, eighteen feet long, must have been a very ponderous affair to freight over the Sierra and across the flats before the advent of the railroad. The boiler room contains three pairs of tubular boilers, two sets of them in constant use and the third kept in reserve. One very effective feature here consists in the recent adoption of six-inch upright columns of steam pipes, nine on each side of the fire boxes or furnaces. These are connected with the boilers, and are of very important assistance in getting up steam. There is no trouble in getting up all the steam required, and more too. A great saving of fuel is also effected. About seven cords of nutpine wood are burned daily. The Chief Engineer in charge of this department is Eph. Wager, and he takes a very evident degree of pride in it.

The Machine Shops.

The numerous mining works naturally created a demand for an establishment right here where repairing could be done and machinery made without having to send hundreds of miles for that purpose. The result was that from a small blacksmith shop the present extensive and very complete establishment has grown by frequent and judicious additions. It contains big forges, a steam hammer, lathes, planers, turning, drilling and sawing machines, all of the latest patterns and the most substantial description, and any work required can be turned out at short notice, from a six-foot hoisting reel to a big steam engine. Moreover, as has been before remarked, just as well finished and effective work can be turned out of these shops as from any establishment this side of San Francisco. A. E. Johnson is the master mechanic in charge of this department, and under his efficient supervision constant improvement is shown.

The Foundry.

Which is conveniently situated near by, is under the charge of James Lovell, a very competent and skillful workman. It is not so extensive as some of the San Francisco foundries, but what work it does turn out is first class and fully up to the requirements. It was a good idea on the part of the Manhattan Company to thus establish their own shops where they could do all their own work as required, and make all necessary repairs instead of having to send so far away in case of accident or for any new work required. The necessities of the isolated situation, however, prompted the practical adoption of the idea.

Other Departments.

The assay office of the company, across the road from the mill, is properly furnished in all its details, and is engineered by Jacob Trolson, who also acts, when occasion requires, as surveyor in and about the mines. The main office of the company, also near the mill, is a very unpretentious structure, but a large amount of very responsible business is transacted therein. M. J. Farrell is chief clerk in charge, and has been for numerous years. John Frost, the old original locator of the mines, still presides over them in the capacity of superintendent of the machinery of the various works, both above and below ground, and is a very efficient man for that responsible position. The whole, mines, mill, workshops, and all connected with the Manhattan Company, are under the superintendence of Melville Curtis, a very wide awake sort of a gentleman. His work and success tells its own story.

FINING MINING COMPANIES.—The Marysville *Appeal*, July 22d, says: Early in the present month, in the suit of Yuba county vs. the Eureka Lake and Blue Tent hydraulic mining companies, an order was issued by the Superior Court of this county requiring defendants to appear on the 21st instant, and show cause why they should not be punished for contempt of injunction in continuing to discharge debris from their mines into the Yuba river. There was no appearance yesterday for the defendants, and Judge Keyser imposed a fine of $500 upon the Eureka Lake company and a fine of $250 upon the Blue Tent company. The Eureka Lake company was some time ago fined $250 for contempt in the same case, which fine is still unpaid. No greater fine than $500 can be imposed for contempt, but the fine can be repeated from time to time so long as the contempt continues. The fines in these cases, of course, constitute a lien upon the property of the companies fined.

FROM the Rainbow mine, Sierra county, $100,000 has been taken out in the last thirty days. Miners are working on the ledge a distance of seventy-five feet apart, and the ore of both points is said to be enormously rich.

The Wonders of New Mexico.

There is a remarkable salt lake situated 150 miles west of Albuquerque, in New Mexico, and about fifty miles from the Arizona line. The lake is located on the top of a volcano mountain, and evidently occupies an extinct crater. It is perhaps three-quarters of a mile in diameter, and is so strongly impregnated with salt that a thick crust of pure white salt, of a spongy consistency, like floating ice, encrusts the margin. It is so plentiful that it is carried away by the wagon load. It has been long used by the Indians. The salt is white, of the purest quality and destitute of sand or any foreign ingredient. The texture is porous, like congealed white foam.

The most curious feature of this lake is a tall column, or monument-shaped formation, which rose up near the center to the height of 100 feet, and which appeared to be composed of white lava thrown up by some convulsion during some ancient period. The outside of this singular column is sloped from the base towards the top, and was rough enough to enable it to be ascended. On reaching the top of the cone, the interior we found to be hollow like a tube, and at the bottom there was seen a circular pond of water with bright emerald green color in appearance, probably to be attributed to the sparse rays of which penetrated the huge tube, and were reflected from the smooth, mirror-like surface of the water. On the projecting sides of the interior of this bowl were found no incrustations of salt on the surface like that on the outside, but on thrusting the hand into the water and withdrawing it the hand came out perfectly white from particles of salt that adhered to it. It was evidently a very strong brine.

There is also a desolate, arid plain, composed of lava, 100 miles in width, situated beyond the Organ mountains, so called because the basaltic columns rising up, as seen at a distance, resemble the pipes of an organ. The great plain beyond is about eighty miles west of Las Cruces. It is entirely destitute of water, which has to be conveyed by those crossing this inhospitable waste. But the remarkable thing about this desert is an immense stratum of gypsum or selmite of a pure white color, and when seen from a distance resembles a huge snow drift. The gypsum bed is several miles in extent, and is in sufficient abundance to furnish a supply for all purposes for which it is used to the habitable globe. There are other remarkable physical appearances in the region mentioned scarcely known to the outside world. It is a scene of wonders.—*Times.*

GOLD FROM PERUVIAN RIVERS.—The whole of the Chuncamba (Peru), says a correspondent in *Iron*, for a number of leagues above and below the Temple of the Sun is auriferous, and the inhabitants of the province Huamelies, through which it passes, obtain, by washing the sand, and by means of sheepskins, $200,000 or $300,000 worth of gold annually. The wool on the skin is cut out until it is about half an inch in length. The skins are then anchored down, with the wool side up, by means of loose stones placed on them, in and below the various rapids, in which position they are suffered to remain from six to twenty-four hours. They are then carefully raised out of the water, turned wool side downward into a batea (tub) of water, and thoroughly washed; the gold falling from the wool of the skin is finally collected from the bottom of the batea. Sheep were unknown to the Incas, and as they obtained an immense amount of gold from this Pactolean stream, it is presumed that they used the skins llama and those of the vicuna. The above will not only be of interest to the general reader, but will also furnish a wrinkle to gold miners similarly situated.

THE PROSPECTOR.—Speaking about the life of a prospector, the Salt Lake *Tribune* says: It requires men who do not wilt because they are broke; who can enjoy the sun, rain and rough fare, and work 15 hours a day; who outwalk a horse without a dollar in their purses for 12 months every year. What a charm there is in this free life under the all-embracing kindly sky of the Rocky Mountains. No care of church, State or household. All the world ahead, no property or money to bother about, with everything to hope and little to lose. No spike-tail coat to be crushed, white shirt to be "biled," fine boots to be shined or duties to society to be performed. No calling to assist the Great Ruler in regulating and running the universe. None of few of the petty things, in short, that fret the life away after once it has settled into its rut. The West is full of men who put in their young years in the happy-go-lucky style of the "prospector," and half their regret for the loss of their first youth comes from the fact that they must now be housed up, cabined, cribbed, confined. Is the genus "prospector" to go out? We trust not yet.

FRUITS OF THE PEACE POLICY.—In 1869 the Navajo Indians were furnished by the Government with 14,000 sheep and 1,000 goats, as an experiment to see whether they would take kindly to stock raising. The animals were supplied at a cost of $30,000. These Indians have now 900,000 sheep and 200,000 goats, raise a million pounds of wool yearly, and support themselves. Previous to that period it had cost the Government more annually to prevent their committing depredations than the sum expended for the stock of sheep and goats so donated to them.

Grub-Staking.

An interesting result of the system of outfitting prospectors on shares is given in some recent finds and locations made through this system. E. L. Preston, manager for Isador Morris & Co., Vienna, some time ago put up the cash for outfitting a prospector to go to the bills. The cost of the expedition was light, and Mr. Preston hardly felt it any inconvenience. Last week he was called out to the seat of operations to inspect results. They are extremely satisfactory. Mr. Preston has returned and gives an outline of the locations made.

There are five, and all situated on Elkhorn gulch, or more properly, on the second gulch up tributary to Elkhorn gulch, and entering it above the Elkhorn mine on the east, and near the summit of the divide between Elkhorn gulch and the east fork. These locations being made in the past thirty days by one prospector, prove that the country is not prospected by any means. The first location is the Baltimore, a galena mine, upon which an incline shaft fifteen feet deep has been sunk, and a two-foot body of solid galena stands there, which returns by assay 218 ounces in silver and 70 per cent in lead. This was the lowest assay, and the vein is solid down as far as opened. It was a blind ledge. The second location is in the same vein, and recorded as the Queen Victoria. The vein is four to six feet wide, in no place less than four feet, and the ore carries copper, black sulphurets of silver, bromide, and chloride, and runs up to 1,000 ounces in silver to the ton. Is is opened by a cut upon the course of the lode. The third location is the southerly extention on the Queen Victoria, called the Minnie May, and shows the same body of ore. The other two locations are not developed as yet. One, located as the Ida Hardin, is on a separate vein, and has six inches solid of high grade galena in place lying contiguous to a heavy iron vein and sand carbonates between.

The carbonate deposit is two to four feet, the iron ore is five feet thick, and carries galena all through, and next is the six inches of galena on the hanging wall.

Mr. Preston is arranging to employ enough miners to start developements on an extensive scale. There is already $2,000 worth of ore on the dumps, and the product will pay handsome profits over all working expenses. — *Wood River Times.*

THE IRON MINE.—Assessor Wheeler gives the Grass Valley *Tidings* some items about the iron mine twenty miles below that town. Using eighty bushels of coal to the ton of iron, the mine is now turning out twenty-four and a half tons of iron per day, and one day thirty tons were turned out of the furnace. Last year 185 bushels of coal were used to turn out one ton of iron, and the result was only about half the amount turned out daily. There are now 165 men employed about the mine, and they get from $2.50 to $3 per day. The company issue scrip to their employes in any amount, from five cents to $5, and issue it as often as it is wanted. The scrip is good anywhere in the town of Hotaling, as it will buy breadstuffs at the stores. None of the employes are compelled to trade at the company's stores. The mine is in a better condition than it has ever been, and wood-choppers and teamsters are in demand there. This mine is owned by the California Iron and Steel Company, and supplies the Judson Iron and Nail Works of this city with their raw material.

NEW MILL.—The new twenty-stamp mill of the Golden Rule mine, at Dragoon, Arizona, that was recently purchased from Fraser & Chalmers, was landed at the millsite on June 4th, and the work of erecting the mill is being pushed by a strong force of men, under the supervision of Capt. B. F. Marrow, of Silver City, N. M. Mr. D. M. O'Sullivan, a machinist of high reputation, recently in charge of the machinery at the Santa Rita mine, is superintending the placing of the machinery. It is expected to have the mill in operation by September 1st. The mill will reduce from fifty to sixty tons per day, and save a high percentage of the assay value of the ores. Capt. P. J. Mitchell, of Silver City, is in charge of the mines, and is pushing developments rapidly with a force of thirty miners.—*Silver City Enterprise.*

THE recent rich strikes made at Juniper Springs continue to turn out even better than it was at first expected they would. Several assays have recently been made on ore taken from the Rico mine, owned by Messrs Lincoln and Lily, and Ensign and Smith, which run as high as $306 2.10 in silver, and $ 2.10 in copper. The pay streak in the ledge is four and one-half feet wide, and gives every indication of permanency.—*Silver City Enterprise.*

FRUE VANNERS.—We visited Lunt's mill, at the Mosquito toll gate, and found that Mr. Lunt is highly satisfied with his Frue-Vanner concentrating belt. This is the first of this kind of concentrators in use in Park county, and the appearance of the concentrated mineral taken by it from the U. P. and K. P. ores gives abundant assurance that it is doing excellent work. The Lunt mill is run by water power, but in time a change will be made to steam.—*Fairplay (Col.) Flume.*

A FEW miners are still working at Meadow Lake. That is the place where "a process" is needed more than anywhere else.

Improving Prospects at Wood River.

Last year the owners of prospects on Wood River, says the *Ketchum Keystone*, saw that the galena veins were lessening in width as depth was obtained on them, and many fearing that development would only prove their properties almost worthless, relinquished work and commenced trying to sell. Efforts to dispose of undeveloped properties proved unsuccessful, as capital seeks only mines that are thoroughly proven as such, and the owners of the numerous prospects at last realized the fact that their only alternative was to run the chances, and, by tapping the veins at good depth, find whether they were permanent. This was done, and in every instance that we know of, the veins, after narrowing opened out wider and richer than they were near the surface, and many that were only fair prospects last year are now recognized as fine mines. We do not think there is another country in the West that can show such a general tendency of so many prospects toward becoming mines of great value. There are already enough proven on Salmon and Wood rivers to insure a good, healthy boom in the near future. But few, in fact, realize the important part that this great mineral belt will play in the mining world from this time forward. The ores are not only very extensive and in hundreds of veins, but they are of great richness. What we most need now is a few more under the control of men able to handle them and erect works for the reduction of ores. This will come about gradually, and the wealth of the country increase. The dullest times for this section were experienced last year.

As late as last year all classes of business were mainly dependent on a boom and transient custom, but now business is conducted on a more sound basis. Less than a year ago we heard men declare that the two stacks of the Philadelphia smelter, then running, were capable of reducing twice as much ore as the country around Ketchum could produce; still, the company, having implicit confidence in the permanency and richness of the mines, made preparations for increasing the capacity from eighty to 160 tons per day, and now have every reason to congratulate themselves, as the amount of ores daily extracted from the mines of Warm Springs creek and Elkhorn gulch alone are more than can be reduced by the works. This is insuring permanency for Ketchum, and the time is rapidly approaching when more smelters will be required, as this is the grand center of the whole upper country. Warm Springs creek, Elkhorn gulch, Boulder, Trail Creek, and some other important districts are directly tributary to Ketchum, which is also the business center for the districts of Big Smoky, the east fork of the Salmon, Sheep Mountain, Sawtooth, Vienna and Galena. It will also be the terminus of the Wood river branch of the O. S. L., and advance with a rapidity not witnessed in any other town in the Territory since the great placer days of the sixties.

A year ago the braying of the mule and voice of the oxdriver could be heard all along the river. Nothing but the primitive modes of transportation could be seen on the trails and roads. But a wonderful change has taken place this year, and the locomotive whistle signals the arrival of railroad trains, only a little over twelve hours from Salt Lake city; and the telegraph line enables business to be transacted with any part of the world daily. Civilization as witnessed in the older countries, is coming, and we are assured of a prosperity, unsurpassed by either Leadville or Butte.

A Furnace for Inyo.—The Inyo *Independent* says: About ten days ago a new body of ore, measuring may tons, was opened in the Montezuma mine. It is of high grade, and gives promise of being as extensive as the body heretofore opened and developed. The new find is situated about 300 feet below the present dump, and dips into the hill as if it ran into and formed a part of the deposit from which the old body of ore is an outpnt. It is exceedingly suggestive, in that it indicates the presence of a very extensive deposit throughout the entire hill. Explorations at this point will be vigorously prosecuted, and it is confidently expected that results will largely increase the extent and value of the property. It is the opinion of several leading experts, who have recently examined this property, that the Montezuma is a large and permanent mine, and that the wonderful product of Cerro Gordo will be here rivalled. On Monday last the furnace site was located and surveyed; a side track laid out and at the present time the grading and track laying are being carried forward to connect the site with the main railroad track. The material and lumber for the furnace are enroute, and will all be on the ground by the first of next week, when work will be begun and prosecuted in earnest. The mine and furnace are owned by the Owens River Mining and Smelting Company. The station and grounds have been named Elma, in honor of the daughter of W. P. Miller, the superintendent of the company.

A remarkably rich quartz bowlder weighing 160 pounds was hydraulieed out of the bank of the Nevada Hydraulic Co., at Gibsonville, last week. The bowlder was smoothly washed, having the appearance of being ground in a potthole. Its value is about $2,500, and nearly all of it is suitable for quartz jewelry.

Useful Information.

Alligator Leather.

The hide of the alligator, which was first tanned as a curiosity, has now become quite an important article of merchandise, and is worked up into a multitude of articles of everyday use. The New York *Sun* furnishes the following:

A large variety of pocket-books, card-cases, hand bags, and other articles made of a peculiar mottled leather, was seen in a Chambers street show-case. A long, narrow piece of the same leather hung over them. It was rounded at one end and tapered away at the other. Two flippers projected from each side of it.

"The use of the alligator skin seems to be increasing," the reporter said to the proprietor of the show-case.

"The increase is astonishing," he replied. "Twelve or fifteen years ago alligator leather was tanned as a curiosity. Few articles were made of it. About four years ago, however, the manufacture of alligator leather began in earnest. First a few shoes were made of it, and the manufacturers of such goods saw there was something in it. It is a peculiarly beautiful leather. There are no two skins marked just alike, and it follows that no two articles made of the leather can be alike. The natural color of the leather is attractive, aside from the beauty of the markings. It finishes soft and flexible. It is conceded the Americans tan and finish it in a manner superior to the best workmanship in the old country. Here is a pocket-book. American alligator skin forms the outside; American calfskin the lining. Any judge of such goods will say that it is by all odds the handsomest as well as the best leather of the kind in existence. Sixty dollars per dozen for such goods, small as they are, is a low price.

"While the beauty of alligator leather is its chief characteristic, its durability is of hardly less importance. These grip-sacks of alligator leather will outwear their owners, no matter how youthful. With these two things in its favor, it is no wonder that the sale of alligator leather is increasing."

"How many alligators were slaughtered to satisfy the demand last year?"

"Not less than half a million."

"How do you get the skins, and where do they come from?"

"Most of them come from Florida and the other Gulf States. The alligators are shot with rifles, and the negroes have almost a monopoly of the business. When an alligator crawls out on the sand for his after-dinner sleep he falls a victim. The negro gets from fifty cents to one dollar apiece for alligators. The hunt is carried on so vigorously that the reptiles are beginning to grow scarce. Laws will have to be enacted to protect them during the breeding season and when young.

"All sizes from two to eighteen feet in length are now killed. The choice skin is six feet long. There is as much difference between the six-foot skin and the eighteen-foot skin as there is between a calf-skin and an ox-hide. The skins are packed in lime for two months to remove the horny scales. The remaining process is much like that for any leather. It takes four months to prepare a skin. There is a tannery for alligator skins in Brooklyn."

"Has any one developed an imitation of alligator leather?"

"The frauds are in using imperfect skins. No lime will soften the horns that have stood the attrition of red hot sand for half a century. Those skins do not wear well between the scales. There are other imperfections in the skins. The demand for colored goods helps us out, however, as the coloring matter covers a multitude of imperfections. When you want an alligator leather article of any kind choose the uncolored goods, pay a fair price, and you will get the cheapest as well as the handsomest and best."

A New Process for rendering textile fabrics impermeable has been devised by a French inventor (M. Piron), which, while it makes them impermeable to air and moisture, at the same time prevents them from rotting, and preserves their flexibility and softness unimpaired. The invention consists of impregnating the fabric with the oil obtained by distillation from birch bark. This oil is used in the preparation of Russia leather, and contains a peculiar phenol, which imparts the agreeable perfume possessed by this leather. It is soluble in all proportions in alcohol, and may be united with coloring matters. When applied to textile fabrics in the form of a thin varnish, it penetrates to every portion, filling the capillary vessels and covering them with a film of very elastic varnish which is proof against water fresh or salt, acids, alkalies and mildew. Fabrics thus prepared are affirmed to be made very imperishable. Not only woven fabrics, but rope, cordage, etc., may be treated with good results.

For Cleaning Black Cloth.—Take one ounce of extract of logwood, dissolve in a little boiling water, strain it and have ready a pail or kettle two-thirds full of boiling water, pour in the extract and add a large tablespoonful each of soft soap and washing soda, and stir altogether; then put in your goods and keep stirring them for ten or fifteen minutes; then take them out and rinse them up and down in a tub of water a few times, hang out, and iron on the wrong side when about half dry. Do not ring them. A snuff-colored brown will be a seal brown. This is only for cleansing rusty black.

Test for Wines.—M. Pradines has recently published a test for wines, by which wines may be examined for their purity. He proposes with this test to answer three questions. First, is the wine natural, secondly, is it diluted, and lastly, has no product of the grape been used in its preparation? The reagent used consists of pure ammonia saturated with rectified ether, which is then filtered and kept in well stoppered flasks protected from the light. To make the test, pour some water in a test tube, add with a pipette or burette about fifty drops of the wine to be tested, shake the mixture, allow five or six drops of the reagent (Diamo-Paradines) to run into the mixture, and shake again. If the wine is good in quality, a beautiful green coloration appears along the line of contact between the reagent and the mixture. If the mixture takes a pale green coloration, the wine has been diluted with water, and the amount of dilution is approximately measured by the varying paleness of the tint produced. If this pale green coloration becomes rapidly clouded and obscured, the wine has been diluted with water and colored with some coloring agent. If the mixture gives no color, or takes a grayish red tint, amaranthine or brick color, with no trace of green, the wine is compounded. In this last case the colorations vary infinitely, modified by the coloring matters used in the wine's fabrication.

Fruit Stains.—In the season of fruits, the napkins used at the table, and often the handkerchiefs and other articles, will become stained. Those who have access to a good drug store can procure a bottle of Javelle water. If the stains are wet with this before the articles are put into the wash, they will be completely removed. Those who cannot procure Javelle water can make a solution of chloride of lime. Four ounces of chloride is to be put into a quart of water in a bottle, and after thoroughly shaking allow the dregs to settle. The clean liquid will remove the stains as readily as Javelle water, but, in using this, one precaution must be observed. Be careful to thoroughly rinse the articles to which this solution has been applied in clear water before bringing them in contact with soap. When Javelle water is used this precaution is not necessary; but with the chloride of lime liquid it is, or the articles will be harsh and stiff.

Good Health.

Conditions of Health-Giving Exercise.

The summer air of the highlands makes outdoor life a luxury, but the chief advantage of the plan is this: The stimulus of a pleasant pastime enables a man to beguile himself into about ten times as much exercise as he could stand in the Turner hall. The visitors of a hygienic gymnasium take their turn at the horizontal bar as they would swallow the drugs of a public dispensary; they know that it is a lesser evil; they know that the road to Styx is the alternative; they intend to come every day, but the intolerable tedium of the crank-work exercise soon shakes that resolution. The motive for exertion is too abstract; it lacks the charm of progressiveness and the stimulus of a proximate, tangible and visible purpose. The sham competition of a regimeut of invalids under the command of a turnmaster does not much sweeten the bitter broth; it is still crank-work, minus the club of the jailer, and nine out of ten hygienic gymnasts will soon find or make a pretext for discontinuing their visits. How many out of a hundred pupils of a young ladies' seminary would dream of performing their "calisthenics" at home? They would as soon walk on all fours, or ride on a dry clothes-line. But arrange a May day pienic in the mountains, and they will beat a kid in climbing up the steepest rocks, and swing ou wild grapevines for hours together.

It is likwise certain that fatigues can be far better borne if the body is not incumbered with a surplus of calorific clothes. A pair of linen trousers, a flannel hunting shirt, and a loose necktie make the most hygienic summer dress. In the afternoon remove the necktie and roll up the shirt sleeves; it can do no harm to imbibe fresh air by all available means, and let the cutaneous lungs share in the luxury. Nor is there any excuse for the widespread fallacy that it is dangerous, even in the most sweltering nights, to remove the bed-blankets. Kick them into the farthest corner if they become too warm, and sleep in your shirt and drawers, or under a linen bed-sheet. Half-naked lazzaroni sleep the year round on the stone terrace of the Museo Borbonico, and outlive the asthmatic burghers in their sweat-box dormitories. The body effects part of its breathing through the pores. Painting a man with yellow ocher and copal varnish would kill him as surely as hanging him by the neck. The confined air between the skin of the body and a stratum of heavy blankets gets gradually surcharged with carbonic acid—in warm weather even to the verge of the saturation point. The perspiration is thus forced back upon the body, and the lungs, perhaps already weakened by disease, have to do double work.—*Dr. Felix L. Oswald, in Popular Science Monthly.*

Two Cholera Experiments.—If experiments on animals are prohibited, experiments must be made on human beings, and in their rudest form. The contrast between such rude popular experiments on man and scientific experiments on animals was illustrated in a speech of Dr. Lyon Playfair in reference to these two kinds of experiments on cholera. The first experiment was tried on 500,000 human beings in London, who were supplied with water contaminated by choleraic discharges, with the result that 125 out of every 10,000 consumers died from the effects of the experiment. In two other experiments made by another water company 180 died in the first experiment, and 130 in the second, out of every 10,000. These popular experiments on a large scale involved the sacrifice of half a million human beings. In contrast with this may be taken the scientific experiments made upon animals by Khiersch and others. These experments were made on fifty-six mice, fourteen of which died from the choleraic discharges. These were not mixed with water accidentally or carelessly, as in the popular experiment, but were administered under definite conditions, and the effect watched. The results of these experiments showed that water contaminated with choleraic discharges was deadly; the water so contaminated was avoided and an epidemic was escaped. *Nature.*

Italy a Malarious Country. Notwithstanding the health advantages claimed for a few localities in Italy, and the general reputation of the "Italian Climate," "Italian Skies," etc., that country is really one of the most, if not the most malarious country in the civilized world. Of the sixty-nine provinces of the kingdom, only six are nominally free from what is known as miasmatic or Roman fever, and in twenty-one the scourge assumes really serious proportions. Every year no fewer than 40,000 men in the army are attacked by the disease, and it is calculated that the prevalence of malaria necessitates the annual expenditure by the Government, of something like 10,000,000 lire, for the maintenance of special hospitals for public servants. It has been found that the extension of the railway system throughout the peninsula has increased the evil. The turning up of fresh, damp earth, and the unavoidable formation of new banks, deep cuttings, and excavations which speedily fill with water, breed the disease in its worst forms. On one of the railway lines which runs through much marsh land, the annual rate of mortality among the employes is thirty-six per 1,000.

A Boon in Ear Diseases.—Among the various cases of ear disease—numbering not less than fifty—at the St. Joseph's Industrial Home, Virginia, the most successful agent employed has proved to be boracic acid, as appears from the official statement by Dr. Minor. Boracic acid has the advantage of not being an irritant to inflamed surfaces, and its action on inflamed mucous membranes and granulations, presents, according to Dr. Minor, two stages. The first, he finds, gives rise to a sensation of slight warmth and moderate stimulation, and is associated with an abundant serous discharge from the succulent tissues, this gradually merging into the second stage, which is one of ease and relief, and is accompanied by a marked reduction in volume of the inflamed tissues, the diminution in size being evidently due to the depurative action of the swollen tissues during the first stage. The granulations were frequently noticed to shrink and disappear entirely under the influence of the acid, where removal by the snare and cauterization with nitrate of silver or nitric acid seemed to stimulate them to increased growth. The great proportion of cures by this agent, as given by Dr. Minor, is surprising.

How to Treat the Hands.—Soapsuds will not chap or injure the hands even if kept a long time in it, if on taking them from the suds they are thoroughly sponged, or dipped in lemon juice or vinegar. The acid destroys the corrosive effects of the alkali and makes the hands soft and white. Indian meal and lemon juice, used when washing the hands when roughed by cold or hard work, will heal and soften them. Vinegar will answer if lemons are not easily obtained. Rub the hands in this, then wash thoroughly, and if you have it, after drying put on a few drops of glycerine. Those who suffer from chapped hands in the winter will find this comforting, and will make sewing much easier.

A Good Country for the Doctors and Undertakers.—The following is clipped from an exchange and will prove interesting to persons who intend leaving for the Northwestern country: "The undertaking business flourishes at Portland and elsewhere throughout Oregon. What with malaria, quinine and whisky, and the debilitating effects of a long journey in steerage and emigrant car, Death's sickle reaps a large harvest, the children especially dropping off like rotten sheep. But still the Northwest is filling up, and everybody is confident about the grand time coming."

Fat is said by Dr. F. L. Oswald to be the best lung food, and among all fat-containing substances sweet cream is the best, salt pork the least nutritious. Consumptives should avoid all scorbutific articles of diet; salt meat, pickles, cheese, pungent spices, made dishes, and all intoxicating drinks.

Increase of Insanity.—Only eight insane asylums had been built in the United States in 1830–34, being State institutions; by 1840, sixteen were built; by 1850, twenty-four; by 1860, twenty-four; and by 1880, ninety, of which sixty-six are supported wholly or in part by State aid.—*N. Y. Herald.*

Passing Events.

The telegraphers' strike still continues, and we have had local strikes among some of our typographical fraternity as well. The stevedores have struck, too, and some of the trades show a desire to do the same. No harm has been done here, however.

The news from the mines is generally good, though there is nothing startling to record. There seems to be a great deal of interest in copper this summer, and many prospectors are on the lookout for it. Numbers of copper smelting furnaces are being made and shipped to producing mines. Lead furnaces are plentiful here just now, also.

The results of the recent earthquakes in Italy were highly disastrous, some 3,000 or 4,000 people having been killed by the subsidence of the island near Naples.

IN Mint Director Burchard's report occurs the following: The mining outlook for Calaveras, with refcrence both to quartz and gravel, was never more flattering than it is to-day, and the assertion that this county affords greater inducements to those desirous of engaging in mining pursuits than any other section of the mineral belt will pass unchallenged.

J. W. DEGOLIA is said to have discovered on his land in the lower part of Grass Valley township a fine bed of "kolin," which is a clay much used by the Chinese and Japanese in the manufacture of fine porcelain wares. The deposit is believed to be extensive and very valuable. If there is enough of it a porcelain factory will be established there.

Rights of Relocators.

The laws of the United States very wisely provide that if a man locates a mining claim and fails to do certain specified work which shows he intends to work it, he loses it, and any man may relocate and own it. They, of course, protect the relocator as well as the original locator. Yet many miners seem to think there is a great difference between the relocator and the original discoverer of the ground. The rights of one are as strong as those of the other, a mere matter of detail in the drawing of the papers proving title being the only difference. One individual of a company may relocate the mine in his own name, if annual requisite expenditures have not been made by the company. An applicant for patent, who, a co-owner, relocated a mine in his own name, as single proprietor, is not obliged to show title back of such relocation; but if the proceedings are otherwise regular, and his former co-owners or other parties fail to arrest an adverse claim, patent may issue in the applicant's name.

This is a ruling which the Interior department has just made in overruling the decision of the Commissioner of the Land Office. In the case in question, the original location was made in 1864, and after numerous transfers the applicants for patent claimed the possessory title. They also made a relocation in 1880, covering the same ground, and using the same name under which the mine was originally located.

The certificate of relocation set forth, among other things, that it was made without waiver of any previous rights, and to secure all abandoned, interfering or overlapping claims. They finally admitted, however, their inability to show by abstract their title under the original location, and hence claim under the relocation of 1880.

The Commissioner of the General Land Office then decided that a relocator must show a complete and unbroken claim of title from the original locator, ending in himself, or prove abandonment of the property by the original locator, or his grantee; also, that relocation, using the same name under which the original location was made, coupled with the attempt to furnish abstract of title from the orginal locator and grantees, shows that applicants claim as purchasers for valuable consideration, and therefore that the relocation confers no new title upon them.

From this the applicants appealed to the Secretary of the Interior, who does not concur in these conclusions. Generally he can see no reason why a locator should be called upon to furnish any facts or data relative to a previous location upon the same ground, or why any inquiry should be instituted relative to antecedent matter, except upon showing of irregularity and of injury to material interests. The law applicable to adverse claims provides how and when such showing may be made in case any rights are liable to be infringed. In this case, applicants, by their admission of inability to furnish complete abstract of title under the original location, as required by the Land Office, virtually waive all claim based upon said location, and rely solely upon their relocation.

None of the apparently adverse interests filed claims of any kind. The right of re-location was never questioned. All claims before the re-location might be considered as abandoned. It has been before decided that failure to assert an adverse claim during the period of publication required by statute, amounts to a waiver of all adverse rights. As there were no adverse claims the question, in this case, was solely between the applicants and the United States.

The proceedings under the re-location, were all regular, and the purchase money was tendered to the government officials and accepted. Final certificate of entry was issued when the Land Office stopped proceedings for the reasons given above. The Secretary of the Interior, however, could see no reason why patent should not be granted under the re-location, even with same name and all. He concludes: "If applicants based their title solely on their rights as purchasers, the regulation of the Land Office might call for consideration; but I find no rule or regulation, and no law, which, on the facts, as they appear, would operate to prevent the issuance of patent on the location by the parties themselves."

INDICATIONS point to preliminaries looking to a commercial treaty between Great Britain and Mexico being shortly instituted.

Molten Lead for Amalgamating.

The employment of molten lead for extracting the precious metals from ores or earthy matter is old or well known. All fire assays and smelting, or other modes where heat is employed, depend largely for their success on the absorbing power of lead and its capacity to alloy with and retain gold and silver. Many methods of using lead for this purpose on a large scale have been the subject of patents. Some years ago, quite a number of inventors were at work in this direction, but with ill success. The exposure of the ore to the action of the lead is made more perfect in many cases by the use of deep lead baths and by various devices for retardation while the ore is rising to the surface. When the ore is introduced by force it is usually formed into masses, and while submerged these masses remain without complete disintegration, and rise to the surface in that condition. It is obvious that the interior portion of these masses of ore is not brought in contact with the lead. One of the requisites of success is to secure the introduction of the pulp, or ground ore, separated and diffused, and with all its particles as widely asunder as possible, and to keep them in constant motion while beneath the surface of the lead.

An inventor recognizing these facts, has devised a plan for disintegrating the masses of powdered ore while in the lead bath. The apparatus is constructed as follows: A flat-bottomed pan, made of iron or other suitable material, is set in an arch and provided with a tight cover. Through the center of this cover passes the hopper. The depth of the pan is about one-fourth its diameter. A stationary circular block of iron or other suitable material, is anchored or secured in the pan, leaving a space beneath it sufficient to permit the rotation of a wing-wheel or displacer. Through the center of this block is a hole, or well, with vertical sides, preferably curving outward at the top. Through this well passes a vertical shaft, driven by any suitable pulley, or otherwise, and carrying the displacer at its lower end.

When the lead is in a molten state, the surface is slightly above the well block. The displacer, or wheel, is now started and by its rotation, a vortex is formed within the well, by which the lead, or the lead with the ore floating on its surface, as the case may be, is caused to flow into and down through the well.

The powdered ore, dry and preferably heated, is introduced through the hopper, and the inflow carries the ore down through the well. Here the action of the wing throws the ore outward into the surrounding lead, not in masses, but, the inventor claims, completely separated and diffused. The motion of the displacer produces rotation of the whole body of molten lead beneath the well block, while the lead above the well block remains comparatively quiet, and this favors the steady influx of ore into the vortex of the well; and each particle of ore while rising by its specific lightness, is carried around and around many times beneath the well block, before it reaches the surface. Meanwhile the continuous rotary undercurrent caused by the action of the displacer prevents any aggregation of the ore into masses, by constantly sweeping over the under surface of the well block and the sides of the pan. The interior of the pan and the underside of the well block are smooth, to prevent lodgment of the ore.

At the surface, being freed from pressure, the ore appears in its original pulverulent condition, and is immediately drawn into the vortex and submerged by the inflow, and thus continuously a given charge is passed and repassed through the lead, until the lead has absorbed and alloyed all the contained gold and silver.

When a given charge has been run, the displacer is stopped, and the tailings are removed from the surface through an opening at the side of the pan. An arrangement of sweeps or scrapers, attached to the shaft, can be employed for this purpose. When the lead is enriched as much as is practicable by repeated charges of ore it is tapped off and run into bars, or the precious metal taken out, or any suitable way.

It is contended that the use of a containing vessel in the form of a shallow pan permits the employment of a lead bath of little depth, so that the displacer can be run at a high speed with but little power, and the centrifugal action of the rotating mass of molten lead admits of a long submergence and a great lateral diffusion of the ore particles.

Brakes for Hoisting Engines.

The matter of the construction of the brakes for hoisting engines in mines, is a very important one indeed, as on the proper working of this part of the mechanism at the shaft the lives of many persons depend. Great care is, therefore, taken to have all the details of the brake mechanism of the strongest and most substantial character. Mr. Wm. C. Waters, of this city, has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improved construction of brake machinery, a description of which will interest miners.

The iron brake shoes are curved to the arc of the wheel in the usual way, and are shod with wood, the wooden blocks being secured to them in a substantial manner. The blocks are cut to fit into channels or grooves in the faces of the shoes, and plates secured by screws hold the blocks in place. The blocks form the inner curve of the shoe and cannot move toward the center without binding more closely.

The shoes are suspended on bars or links, the lower end of which rest on foundation blocks, which are united by rods, there being a brake-shoe on each side of the wheel. The backs of the brake-shoes are flanged at their edges so that the single bar which supports each shoe lies between the flanges, and bolts or shafts pass through the upper ends of the bars and through the flanges horizontally at or near their centers, so that the shoes turn freely on these bolts.

Vertical bars are fitted on the ends of the bolts or shafts which pass through the flanges, so as to stand outside the edge of the wheel rims and rods, extending across the sides of the wheel just above and below the center. This causes the brakes to act directly toward the center of the wheel. An arm is fitted on the shaft or bolt, and projects horizontally outward and is connected by a rod with the lever by which power is applied. The inner end of the arm has a toe projecting downward, and when the outer end of the arm is drawn down it brings this toe into contact with the back of the brake shoe and presses it against the wheel.

The slot through which the bolt or shaft passes allows it to move back as pressure is applied, and the side rods draw the opposite brake shoe against the wheel upon that side, thus gripping the wheel firmly between them. When the brake is released by lifting the arm upward the toe is thrown back and strikes a lug which is formed on the back of the brake shoe, and thus draws or stands this shoe back, the slot in the shoe allowing the side bars enough motion to permit the opposite shoe to fall away and leave the wheel free from pressure.

Adjusting screws pass through lugs which project from the lower ends of the brake shoes, and when the brakes fall away from the wheel these screws will strike the suspending links or bars, which prevents the lower end from swinging back far enough to throw the upper end in and cause it to rub against the wheel. Set screws are placed in such a position that they regulate the distance that the brake falls back.

THE report for the last quarter of the output of the mines whose ore is shipped from Leadville is published in the *Herald* of that city. The tabulated results show that there have been mined 18,078 tons of lead, 2,413,665 ounces of silver, and 4,877 ounces of gold. At an estimate of $90 a ton for lead, $1.10 an ounce for silver, and $20 an ounce for gold, the aggregate value is $4,279,515. For the preceding quarter the value was $8,662,062, so that the product for the first six months of the present year is $7,942,447. The value of the output for the corresponding period last year was $7,822,390. There has, therefore, been an increase of $120,087. This is not a large gain, but when it is taken into consideration that the Harrison smelter and the Tahor stamp mill, two of the largest establishments of their kind, were destroyed by fire during the intervening period, the increase is fully as great as could have been expected.

IN a bend of the Merced river, above Red Banks, a considerable body of chromic iron is known to exist. The difficulty of transportation makes the mineral deposit of little present value.

THE *Lodi Review* has donned a new dress and now appears in eight-page form. The *Review* earns the good opinion in which it is held.

Foundry Notes.

At the Pacific Iron Works in this city they have recently been making a number of smelting plants, both for copper and lead, all being water-jacket furnaces. Among those lately shipped was a thirty-ton lead plant for Owen's River, Inyo county. This is a new enterprise under the auspices of W. P. Miller, of Castle Dome. A 30 ton copper plant has been sent to Copper City, New Mexico; a 40-ton galena plant to the Ruby Mining Co., Bullionville, Nev.; a 30-ton galena plant to the Hawley Mining Co., Inyo county; a 10-ton copper plant to the Two Republics mine, Lower California; a 30-ton copper plant to the Yaqui Mining Co., Sonora, Mexico, and a 30-ton copper plant to the Copperopolis Mining Co., Arizona.

From the Chicago shop of the Pacific Iron Works they have been shipping some smelters also. A thirty-ton plant went from there recently to the Eureka Mining Co., Copper City, New Mexico; another thirty-ton plant went to the H. O. W. Mining Co., at Deadwood, Dakota; a thirty-ton copper plant to the Canyon City reduction works, Colorado, and a twenty-ton galena outfit to the Star Mining Co., at Galena Colorado.

At the works in this city they have recently built several more of the Wheelock engines, a type now becoming very popular and standing in the front rank of first-class engines. A 100 horse power engine of this type, 16x36, was recently made for the Oakland Hosiery Co.; a 24x48 for the Welch flour mills, at Stockton, and a 26x48 for the Portland, Oregon, flour mills.

They are doing quite a lot of work on the U. S. steamer Monadnock, being built under contract at Mare island. They are furnishing the propellers, shafts, etc. They are also turning out quite a number of the Baker horse power mining hoist. This seems to be in great demand, answering its purpose excellently. We recently illustrated and described this machine in the PRESS. With it, one horse will handle about 1,000 pounds at the rate of 12 feet per minute. A 60-ton Howell furnace lately built at these works was shipped to the Qusi mining company of Sonora, Mexico.

Minerals in Counties

The State museum is now being re-arranged on a different plan from that heretofore existing. The ores and minerals of a certain character have been grouped together so that one looking for ores, of mercury for instance, could see all the varieties in one case, with the localities marked. It was thought this was the more convenient plan for reference. When the idea of a special exhibition of minerals during the conclave was broached, it was decided to ask the counties to contribute as counties. In the course of the work it was thought best to remodel the museum and class the ores and minerals by counties.

Thus one wishing to see what was found in Inyo county could see in a case, or set of cases, all the varieties of mineral products from that county. The collection will be divided, therefore, not into ores and minerals, but counties.

In some respects this arrangement will be of benefit. In the first place, it is hoped that when this plan is carried out the counties will take more interest in the Bureau and assist their respective localities by contributions of various kinds. It is thought that this will result in much more elaborate collections representing the mining interests of the State than we have before seen.

The citizens of the various counties cannot afford to have their localities unrepresented. They will make special efforts to collect and forward specimens of all their mineral products, and see that a creditable display is made.

Moreover, in the minds of some persons, the arrangement by counties instead of by classes of ores or minerals is highly preferable. It seems to separate the mineral from the agricultural parts of the State. To the man in search of mines it gives the proper clue to the locality he seeks. He will soon recognize where certain ores or minerals predominate, and if he is in search of a particular class, can locate them readily.

At all events the State Mineralogist is now engaged in arranging ores and minerals at the State Mining Bureau on this system, and the public will soon be able to judge how it works.

Blasting in Mines—No. 2

The Radial System of Boring

The system of machine boring introduced by W. B. Brain, is known as the radial system, the fundamental principle which constitutes its distinctive character being to make the holes of a series to radiate from a fixed point. The object of this radiation is two-fold; namely, to utilize the face of the heading as an unsupported side, and to reduce to a minimum the time consumed in changing the position of the stretcher-bar. It is evident that if the holes

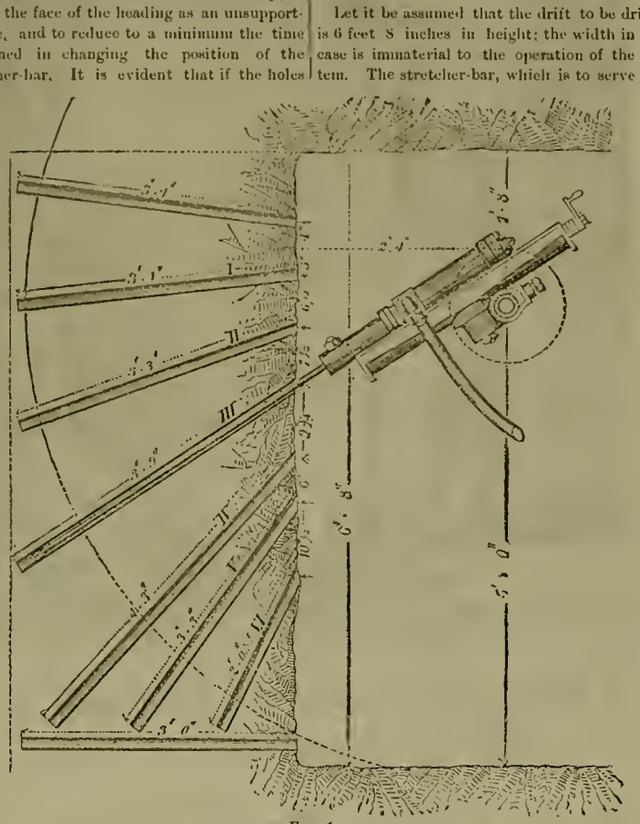

Fig. 1.

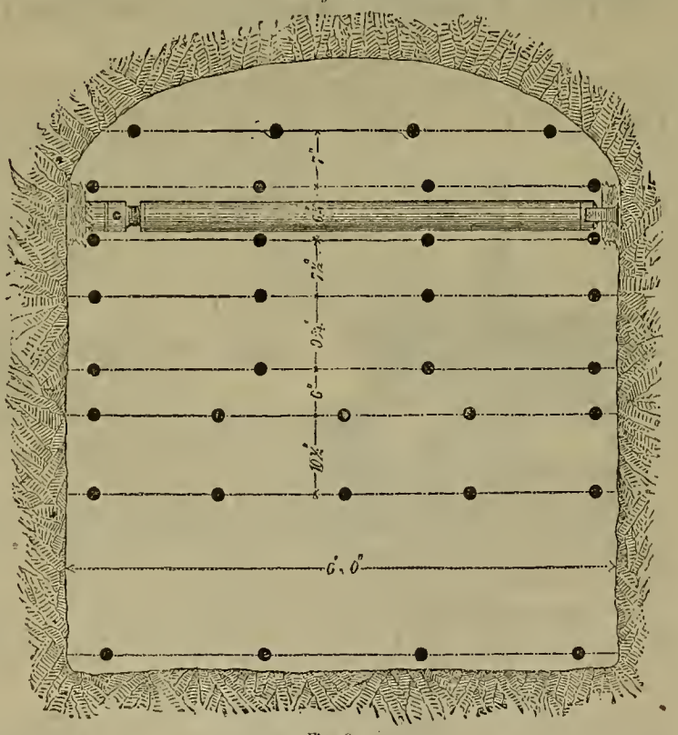

Fig. 2.

THE RADIAL SYSTEM OF BLASTING IN DRIFTS.

are made to radiate from a fixed point, and the horizontal position be avoided, none of them can be perpendicular to the face of the heading, and consequently the lines of fracture from each charge tend to reach the face.

A consequence of this fact is that no unkeying of the face is necessary, since each shot tends to blow outwards. Thus the labor of specially angling the center holes for this purpose is wholly saved. On the other hand, as all holes have to be set at regular angles, additional time is consumed in setting the machine. There still remains in favor of the system the time saved in changing the position of the machine support. The end proposed by the designer has been attained in a degree that gives to the radial system a high practical importance. The advantages offered by the system will be best appreciated by a description of the manner in which it is carried out, and which we take from Andre's treatise on "Coal Mining," published by Spon, of London:

Let it be assumed that the drift to be driven is 6 feet 8 inches in height; the width in this case is immaterial to the operation of the system. The stretcher-bar, which is to serve as a support to the machine, is fixed at a certain height from the floor, and at a certain distance from the face, as shown in Figs. 1 and 2, of the engraving. The height of the bar above the floor, with slight modifications to suit existing conditions, will be the same in all cases; but the distance of the bar from the face will be determined by the length of the machine, or at least by the distance from the centre of the clamp to the end of the piston-rod into which the bit is fixed. It is obviously desirable to reduce the distance between the face of the heading and the stretcher-bar to the least possible, since the angle of the holes will rapidly increase as this distance is diminished.

When the stretcher-bar has been fixed in position, as shown in the drawing, Fig. 2, the boring is commenced, from instructions previously furnished by the engineer in charge. The number of holes to be bored is determined by him, in accordance with the toughness of the rock and the strength of the explosive to be used, and when once the position of the holes have been thus determined they are required to be strictly adhered to, irrespective of joints, fissures due to former shots, irregularities of the face, or any other circumstances that may exist peculiar to the case. Thus the exigencies of machine labor are sought to be complied with rather than those of least resistance in the rock. The instructions furnished to the men respecting the boring of the shot-holes are drawn up in the following manner:

INSTRUCTIONS. HEADING, AT COLLIERY.

Stretcher-Bar.

Stretcher Bar to be fixed..... ..	1	ft.	8	in. from top.
" " "	5		0	" bottom.
" " "	2		4	" face.

Holes.

I.	3	in. down from level	3	ft.	1	in. deep.
II.	6¾	" " last hole..... ..	3		3	"
III.	7½	" " "	3		9	"
IV.	9¾	" " "	4		3	"
V.	6	" " "	3		3	"
VI.	10½	" " "	2		0	"
	Bottom hole from last hole.....		3		0	"
	Top hole, 4 in. above level.....		3		2	"

The instructions here show that after the stretcher-bar has been fixed in the position indicated, the top hole is to be started at a point 4 inches above the level of the machine; that is, 4 inches above the point upon which the bit would strike when the machine is in the horizontal position. This position is shown by the dotted lines on the drawing, and the point in which it meets the face is that from which the measurements are taken. The drill is therefore directed upward until its edge would strike a point situate 4 inches above this, and the hole is bored in that direction to a depth of 3 feet 2 inches, according to the instructions. It will be seen from figure 2 that a series of these holes is bored across the face; this series will thus be all of the same depth and in the same plane.

The holes marked I on the key section, furnished with the instructions, are to be started 3 inches down from level, that is, 3 inches below the point at which the horizontal lines meet the face. The machine is therefore directed downward until the bit would strike the face 3 inches below that point, when it is clamped in position. The hole is then bored to a depth of 3 feet 1 inch, according to the instructions, at which depth the bottom of the hole will be in the same vertical plane as that of the holes in the top series. A series of these holes is also bored to the same depth across the face, as shown in the figure, all of which will be in the same plane. The instructions show that the next series of holes, marked II, are to be started from points situate 6¾ inches below the center of the holes in the series, 1, last bored. The machine is therefore directed downward until the bit would strike the rock at the required point; here it is clamped in position, and the hole is bored to the indicated depth of 3 feet 3 inches. This depth is sufficient to reach the same vertical plane in which those already bored terminate. These holes being repeated across the face, will form a series all of which will be in the same plane. The holes in the series marked III are to be bored from point situate 7½ inches below the centers of those in series II, last bored. The machine having been directed to these points in the manner described, the holes are bored to the indicated depth of 3 feet 9 inches to make them terminate in the same vertical plane as those above them. In like manner, all the holes in this series will be in the same plane. The remaining series are bored in the same way; that is, No. IV at a distance of 9¾ inches from No. III, and to a depth of 4 feet 3 inches; No. V, at a distance of 6 inches below No. IV, and to a depth of 3 feet 3 inches; and No. VI at a distance of 10 inches below No. V, and to a depth of 2 feet. It now only remains to bore the horizontal holes at the bottom to a depth of 3 feet.

If now we suppose these holes charged and ready for firing, it will be seen that the charges will have to be fired in the reverse order of the numbering. The series marked VI being first fired, that portion of the face which is situate in front of these charges will be brought out, because the angling of the holes is such that the lines of fracture will run to the face. The removal of this portion of the rock will leave that behind which the charges in the series marked V are situate, unsupported, and hence the explosion of these charges will readily bring out that portion of the rock. In the same manner, the explosion of the charge in No. V renders the conditions favorable to the action of those in No. IV. By the removal of the rock below series IV, the whole of the above is left unsupported, and hence the successive firing of the remaining series takes place under very favorable conditions. It is also evident that the same favorable conditions will exist in a still fuller degree if the whole of the series be fired simultaneously by the aid of electricity. This method of firing, and the use of a strong explosive, are necessary to obtain the full advantages offered by this or by any other system of deep boring. The radial system is one of the best of those which have been designed to comply wholly with the requirements of machine labor. It should be remarked that it is especially applicable in cases where the stretcher-bar is used with one, or at most two machines.

Metallurgy and Ores.

Nevada Metallurgical Works,

No. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores Worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, Etc.

Working Tests (Practical) Made.

Plans and Specifications furnished for the most suitable process for working Ores.

Special attention paid to Examinations of Mines, plans and reports furnished.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

282,024.—SAFETY DEVICE FOR BRIDGES AND ELEVATED RAILWAY STRUCTURES—J. W. Young, Ft. Moroni, A. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

WEIGHING SCALE.—Wm. G. Collier, Merced. No. 281, 753. Dated July 24, 1883. This scale for weighing purposes consists of a circular, self-balanced rim, having arms and a central hub with central knife-edge pivot upon which it may oscillate. The article to be weighed is suspended from a pivot at a short distance horizontally from the knife-edge supports, and a permanent counterbalance weight is fixed to the rim beneath the knife-edge fulcrum, with a corresponding index, or scale, at any convenient part of the rim, so that all weights within a certain amount will be balanced by the movement of a counterweight at nearly right angles from a vertical line through the point of suspension, and indicated by the scale. Weights above this amount are counterbalanced by disks of fixed values suspended from a point on the rim in a horizontal line with the fulcrum and point of suspension of the weight, these disks being their own registers of what they counterbalance, while the intermediate weights above this amount will be indicated upon the scale, so as to enable the operator to ascertain all weights within certain limits, without being obliged to move the counterbalance weights for each change. A pawl engages a rack upon the rim and holds the indicator at the proper point for each weight until released. In connection with this mechanism is employed an improved system of platform levers, which are connected with the weight suspending arm, and by which error of motion is overcome.

CAR COUPLING.—Frank Miller, Olema. Assignor one-fourth to N. M. Gordon and David Nye, San Rafael, Cal. No. 281,779. Dated, July 24, 1883. This is an improvement on a device of a similar character previously patented by the same inventor. It consists in a means for forcing back the guard and swinging the coupling bar to one side to uncouple the device, and is a means for adapting the coupling for use in connection with the ordinary link and pin. The object is to simplify the construction of the former coupling, as far as it relates to the means for uncoupling the device, and to adapt it to a more extended use.

CAN-FILLING MACHINE.—Mathias Jensen, Astoria, Oregon. No. 281,767. Dated July 24th, 1883. This invention relates to an improved machine for filling cans with fish preparatory to sealing the same, and it consists in a means for automatically supplying the fish and shaping it to enter the can, and a means for supplying the can and adjusting them to the filling spout or nozzle, compressing the fish into them, and finally removing them ready to be capped.

HEATING APPARATUS FOR CARS.—Isidor Shirpser, assignor to Paul Steck, S. F. No 281,801. Dated July 24, 1883. The object of this invention is to heat a train of cars by the introduction, through suitable registers in each, of air heated at and delivered from a single place in the train by simle and efficient means, whereby the danger of fire, in case of wreck, is avoided.

DRAWERS.—George Wittman, S. F., assignor to Dana Newstadter. No. 281,816. Dated July 24, 1883. This invention relates to certain improvements in drawers for underwear, and it consists in a means for re-enforcing or strengthening the crotch seam and front opening.

An Amalgamating Ore Separator.

Among the recently invented devices of interest to the mining community is an ore separator which operates on the amalgamating plan, and is intended to be placed behind a quartz mill, where the tailings may be passed through it. There is a washing cylinder-case having a flat base trough and a cover-section hinged together. At one end the cylinder has a full end wall, while at the discharge end, the base only is closed, the water and sediment flowing out at the open end of the cover-section.

A rotary shaft extends lengthwise through the central portion of the cylinder, and is journaled in boxes at the ends. To this shaft are securely attached ou opposite sides a series of inclined but parallel copper flume-blades, which have curved outer margins of elliptical form, moving, as the shaft is rotated, near the case wall. A base trough is cast at the bottom of the lower section of the case, and forms an offset. The trough is shallow and its floor is flat, extending from end to end of the case.

In the side walls of the trough are vertical grooves, in which are seated a series of transverse ribs, or riffles, these being made removable. The upper edges of the riffles are designed to lie quite near the margins of the flume-blades, so that the particles of gold passing therefrom will be quickly stopped in the interspaces, or cells between the riffles, in which quicksilver is placed. Near the closed end of the case is placed, in the cover-section, an entrance spout, or hopper, through which the pulp from the stamps falls into the case, falling on the first flume-blades of the series whereon the sediment is washed, and, as the blades turn and assume a vertical position, passes downward in the interspaces, the upper portion, however, being caught by the succeeding flume-blades and further washed, and again falling through the interspaces as the shaft rotates.

The broad rotating flume-blades are covered with quicksilver, and are designed to catch, during the operation, the lighter particles of floating or "flour" gold. As the heavier portions of the sediment fall from the flume blades through the interspaces, they are received by the riffles in the base trough, which prevent their rapid passage, so that the particles of gold therein, being of superior gravity, fall and are caught in the cells of the trough.

As the lower end of the case is closed at the discharge end by the half wall, the water cannot flow out under the mass and wash off the heavy particles of gold, but must overflow, passing over the half wall and leaving the valuable portions of the sediment therein, to be acted on again and again by the current and the rotating blades.

El Dorado County to the Front.

A very rich strike has recently been made in Greenwood, or Spanish dry diggings district, El Dorado county, in this State. The mine belongs to the Morrell Consolidated Gold Mining Company, but is not one that is on the market. It has been worked for over twelve years, and a few years ago Mr. Morrell obtained a controlling interest. It has been worked in a small way, and a tunnel 120 feet long has been run. A mill is now being erected, it being expected that they would get $10 or $12 ore to work. Unexpectedly, however, they have struck on to very rich rock, from $1000 to $3000 per ton, and it is estimated by the owner that there is from $50,000 to $100,000 in sight. From a letter of the superintendent to the owner we take the following items:

"Two weeks ago what was pronounced a brilliant prospect has now ripened into reality. In other words, instead of a prospect you now have a gold mine. With a tunnel 120 feet long, and at a depth of forty feet, we have three parallel and continuous gold veins with an aggregate width of two feet, all thickly headed with free gold, and each yielding at a low estimate $1,200 per ton. Should the quality of these gold-bearing veins improve for fifty feet downward in the same ratio they have done from the surface to the present level, the yield of gold will be almost fabulous, and of this there is scarcely a doubt. In the north drift the formation is pronounced by experienced miners the best ever seen in this region. This drift is on quartz ore, and leads to a point under the old Johnson shaft, about twenty-five feet distant, where some exceedingly rich gold quartz was taken out, but abandoned on account of water. This point for which we are now drifting we have every reason to believe will prove even richer than the one now uncovered. In the north drift the indications promise to show something good at any moment."

THE commission appointed to investigate Belmont's charges of the frauds which he claimed were being perpetrated in the importation of sugar from the Sandwich islands, it is learned, will not sustain them fully.

ILL health generally comes from lack of the proper life orces in the blood. To restore the blood to a healthy state use Brown's Iron Bitters.

Look for Your Subscription Credit.

Subscribers on paying for this paper should look at the date of the printed labels on their papers, and if the same is not credited, in due time, up to the date paid to be sure to *write* us without delay. If an agent or clerk receiving the money should inadvertently or intentionally omit credit, it is important to the subscriber and ourselves that we be informed of it IMMEDIATELY, that we may act accordingly. Subscribers will please notify us of all errors which they may notice of any kind on our mailist. Be sure to write us if the paper comes after you wish it discontinued.

ORE PULVERIZER.—The rotary ore pulverizer, advertised in another column as for sale by Mr. Heald, has been used but very slightly, and is a bargain to any one in want of such a machine. It is only sold because the company which ordered it is dissolved, and there is no possible use for it. All the necessary gearing, frame, etc., go with the pulverizer, which can be set running in half an hour after it is received. Parties needing something which will grind ore fine, will do well to communicate with Mr. Heald concerning this machine.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

O. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Arizona Territory
M. H. JOSEPH—Eureka, Nev.
I. M. LEHIY—Los Angeles, San Bernardino and San Diego counties.
A. C. KNOX—Oregon and Washington Ter.
J. J. BARTELL—Yolo county.
E. P. BILLINGS—San Luis Obispo Co.

DON'T FORGET THE STAMP,—Always take a last look at a letter before posting to see that the stamp is in place Recently one of our agents in Los Angeles county found a letter containing $3 for one year's subscription to our paper, held for postage which the writer no doubt thought he had duly stamped, and but for the incidental finding of it by our agent, would of course have supposed we had received the money at the proper time. Let all subscribers when remitting or ordering their paper stopped be sure they duly stamp their letters.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

ADDRESS all corresponedence to the name of the paper or firm, as either of the publishers or editors connected with theoffice are quite likely to be absent at times.

ASSESSMENT NOTICE.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California; location of works, Drytown, Amador county, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 31st day of July, 1883, an assessment (No. 3) of eight cents (8c.) per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, 523 California St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of September, 1883, will be delinquent and advertised for sale, at public auction, and unless payment is made before, will be sold on Thursday, the 27th day of September, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. A. MARTIN, Secretary.

OFFICE—Room 6, 523 California Street, San Francisco, California.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO, Patent Agents.
No. 252 Market St. Elevator, 12 Frout St., S. F. Telephone No. 658.
A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

Carson and Colorado Railroad.

(NARROW-GAUGE.)

The Company announces the completion of its line March 1, 1882, to OANDELARIA, Columbus Mining District, Esmeralda Co., Nev., 158 miles from Mound House (Junction with Virginia and Truckee Railroad).

STAGE CONNECTIONS,

At Hawthorne with U. S. Stage Company's daily coaches for Aurora (26 m.); Bodie (37 m.); Lundy and Bridgeport.

At Luning (125 miles from Mound House) with Gilmer, Salisbury & Co.'s tri-weekly stages (leaving Tuesday, Thursday and Saturday mornings) for Grantsville, Belmont and Tybo.

At Belleville (150 miles from Mound House) with Belleville and Independence Stage Co.'s stages for Benton (40 m.), Bishop Creek, Big Pine and Independence.

At Candelaria, with U. S. Stage Co.'s stages for Columbus (8 m.), Silver Peak, Montezuma, Alida Valley, Gold Mountain, etc.

THROUGH TICKETS

To the above points for sale at San Francisco, Sacramento, Reno, Carson and Virginia R. R. Ticket offices.

This is the direct and natural route for Passengers and Freight, to points in Southern Nevada, Mono and Inyo counties, California. The line, laid with steel rails and redwood ties and equipped with new and first-class rolling stock, is penetrating new and most promising Mining Districts which are now attracting deserved attention throughout the country.

For information on through freight rates apply to

H. M. YERINGTON, Gen'l Supt. D. A. BENDER, Gen'l Freight & Pass. Agt., Carson, Nev.

BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables, and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in subdivisions to suit purchasers, at very low rates and on easy terms. There are 12,000 acres at from $3 to $30 per acre, including pasturage, vine, fruit and grain land. Will sell a large tract at a great bargain. Send stamp for map and circular to EDWARD FRISBIE, proprietor (on the Grant), Anderson, Shasta county, Cal.

PRINTERS, AUTHORS, INVENTORS, PATENTEES, BUILDERS, MANUFACTURERS, MACHINISTS, MERCHANTS, and other trades-people can have satisfactory Engravings and Electrotypes made at moderate prices by the S. F. ENGRAVING CO., No. 405 KEARNY ST. Send photographs, sketches, drawings, models or samples for estimates. Map and Woodcut Engravings enlarged or reduced by the aid of photography, at less than one-half the cost of the originals and in a short time. Photo-relief, Zincograph and other improved methods employed.

"ONE OF OUR MOST INTERESTING EXCHANGES," is the way the *Southern Planter*, of Richmond, Va., speaks of the RURAL PRESS.

News in Brief.

The treaty between France and Tunis was submitted to the Chamber of Deputies August first.

Mitchell won the toss for choice of ground for his battle with Slade at some place near Kansas city.

Carey, the informer, met death at the hands of one O'Donnel, who shot him on board the steamer in Algoa bay, Africa.

Clifford Lloyd has been appointed Secretary to the Local Control of Representation of the British Government in Egypt.

The display of the Louisville Exposition, which was opened by the President Aug. 2d, exceeds in fullness the hopes of the most sanguine.

The demoralization of the telegraph service, owing to the strike, is reported quite complete; in many eastern cities, business is entirely paralyzed.

The *Standard'* correspondent at Cairo says: "There will probably be heavy death returns from Alexandria shortly when secrecy is no longer possible."

Mount Vesuvius is in a state of eruption, and lava is descending from the crater in the direction of the town of Torre del Greco, at the southwest.

Officer Michael Foley, who was arrested in this city, in consequence of the result reached by the coroner's jury, in Shannahan's case, was released on furnishing bail in the sum of $5,000.

The immense bridges spanning the Brazos river and canyon, on Paita Pinto Mountains, about seventy-five miles west of Dallas, built by the Texas Pacific, were set on fire last Monday night.

The jury returned a verdict that Captain Matthew Webb came to his death while attempting to swim the whirlpool rapids of Niagara river, but the immediate cause the jury is unable to determine.

There is still some uneasiness among Boston firms in anticipation of other failures which might follow the recent suspensions, but none were announced except that of Macomber and Greenwood, and there is a feeling that the worst is over.

The Oroville *Mercury* says: Capitalists are at present projecting a scheme, which, if carried into effect, will make Oroville one of the greatest mining centers in the world. This project is neither more nor less than the organization of a company who propose to mine Carpenter's Flat to the bedrock. It is a well-known fact that the entire flat is rich mining ground, but as yet no adequate method has been employed to get rid of the water, which is encountered a short distance from the surface. The new company propose to work it by means similar to those in operation in the silver mines on the Comstock lode. Powerful pumps are to be placed at different points and it is believed that all the water can thus be got rid of. The working of this vast gold field will necessitate the employment of thousands of men. We are not at liberty to divulge the names of the projectors, but can state that they are very wealthy and we are assured that their plans will be put in operation at no distant day.

SEEK

health and avoid sickness. Instead of feeling tired and worn out, instead of aches and pains, wouldn't you rather feel fresh and strong?

You can continue feeling miserable and good for nothing, and no one but yourself can find fault, but if you are tired of that kind of life, you can change it if you choose.

How? By getting one bottle of Brown' Iron Bitters, and taking it regularly according to directions.

Mansfield, Ohio, Nov. 26, 1881.

Gentlemen:—I have suffered with pain in my side and back, and great soreness on my breast, with shooting pains all through my body, attended with great weakness, depression of spirits, and loss of appetite. I have taken several different medicines, and was treated by prominent physicians for my liver, kidneys, and spleen, but I got no relief. I thought I would try Brown's Iron Bitters; I have now taken one bottle and a half and am about well—pain in side and back all gone—soreness all out of my breast, and I have a good appetite, and am gaining in strength and flesh. It can justly be called the *king of medicines*.

John K. Allender.

Brown's Iron Bitters is composed of Iron in soluble form; Cinchona the great tonic, together with other standard remedies, making a remarkable non-alcoholic tonic, which will cure Dyspepsia, Indigestion, Malaria, Weakness, and relieve all Lung and Kidney diseases.

After eating each meal take a dose of Brown's Iron Bitters. It helps digestion, relieves the full feeling about the stomach.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for so many years, the firm' name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That is this understood and appreciated is evidenced by the number of patents issued through their Scientific Press Patent Agency (S. F.) from week to week and year to year

Complimentary samples of this paper are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or *beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Information is wanted at this office of one Joseph Craig, formerly of Cass county, Illinois, who came to California in 1849.

Ie the Bset Pump in the World Another New Improvement ie Lewis' Patent Spray Attachment.

Can change from solid stream to spray instantly. Regular retail price, $6. Weight, 4½ lbs. Length, 32 inches.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

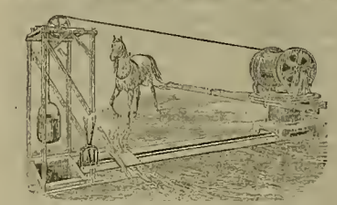
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.



WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, rivoted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

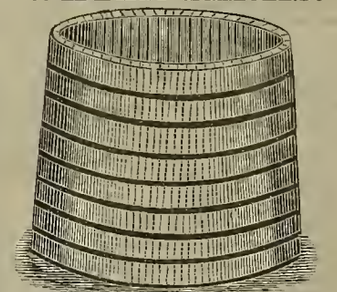
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.

It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000 pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.



While the power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. ☞ SEND FOR CIRCULAR. Address

HERCULES POWDER

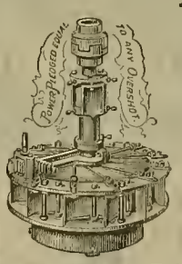
HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.



ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

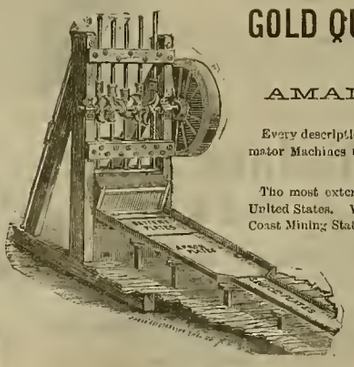
EXCELSIOR BLASTING POWDER,

Manufactured by the



EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro Glycerine Powder, as safe to use and handle as any other Nitro Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

EXCELSIOR POWDER COMPANY,

Room 9, No. 3 California St., - San Francisco, Cal.

GOLD QUARTZ and PLACER MINERS'

Silver Plated

AMALGAMATING PLATES,

For Saving Gold.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought, or gold separated for low percentage of result.

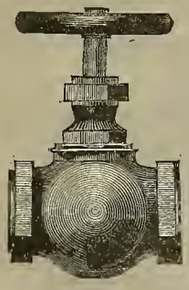
IMPROVED FORM

—OF—

HYDRAULIC GIANT



We call the attention of those using or interested in Hydraulic Mining Machinery to the above cut of an improved form of Hydraulic Giant, in which it will be observed that the Deflector and heavy weighting rear part are abolished and a lever attachment, working with a ratchet and pawl substituted, by which the pipeman, standing in the rear of the machine, has, without danger of "bucking," full control of the direction and effect of the stream. In an action in the U. S. Circuit Court, entitled F. H. Fisher and Joshua Hendy vs. Richard Hoskins et al. of the Marysville Foundry, a permanent injunction has recently been ordered against all persons manufacturing or using any form of Hydraulic Machine having the equivalents of the above.

All of the usual sizes are manufactured (under an exclusive right) and for sale at reduced prices by JOSHUA HENDY, at the

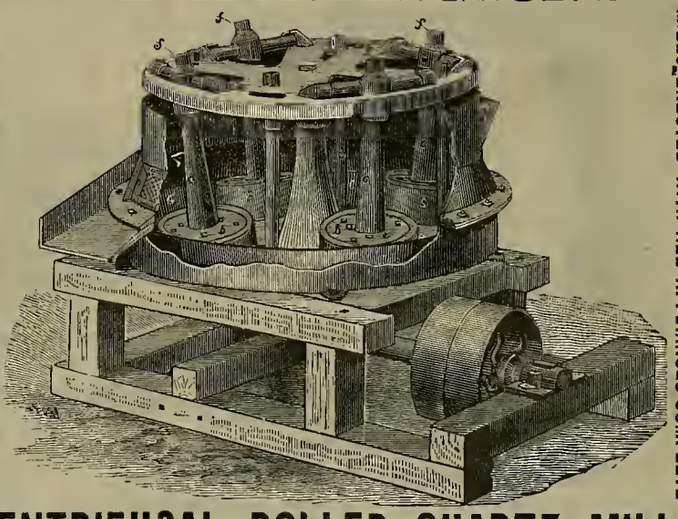
MILL & MINING MACHINERY.

F. A. HUNTINGTON,

No. 45 Fremont Street, - - San Francisco, Cal.

PATTEN'S



CONCENTRATOR

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

F. A. HUNTINGTON'S

CAPACITY AND DURABILITY GUARANTEED.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

CENTRIFUGAL ROLLER QUARTZ MILL!

After running one of these mills on the Whidden mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

F. A. HUNTINGTON, ESQ.—DEAR SIR: Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Company's property, at Shingle Springs, El Dorado county, Cal., about four months, and it did good and satisfactory work; a greater portion of gold remaining in the mill than in a stamp battery.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, AUGUST 11, 1883.

VOLUME XLVII Number 6.

A Square Amalgamating Pan.

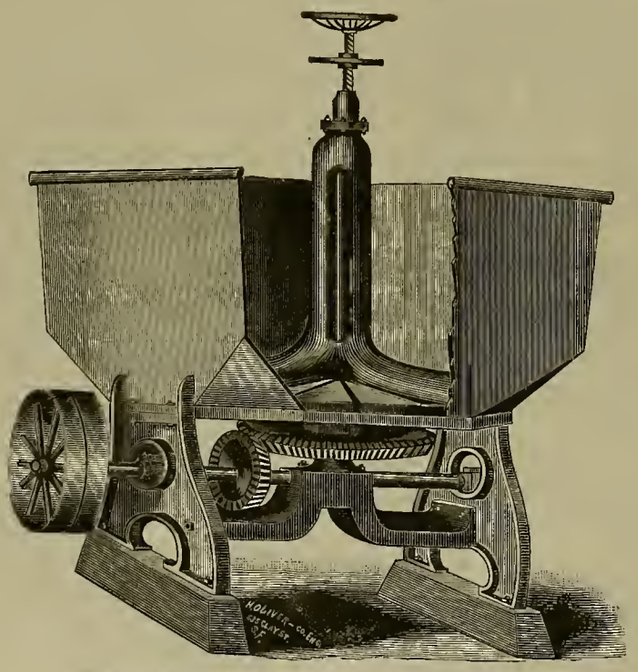
We examined this week the square amalgamating pan for amalgamating the ores of gold and silver, which was recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency by G. W. and W. L. Strong, of this city. An engraving of the pan is shown on this page. The object of the form of construction is to produce a more perfect and constant circulation by means of the angles formed by the shape of the pan within which the muller revolves.

The upper part of the pan is made square in horizontal sections, though the center is a hutton core, through which projects the shaft which rotates the muller.

When the muller is set in motion, the current of pulp will flow outwardly until it strikes the corner of the pan, where it will be arrested and thrown back upon itself from above, passing down the center and beneath the muller and grinding shoes.

To produce the most perfect circulation, the lower corners of the pan are cut inward so as to make the corner faces, which are flat. This gives the bottom an outline, nearly octagonal, as shown by the cut, with the sides sloping upward from it; so that when the pulp flows out from beneath the shoes it strikes these faces and is thrown upward, so there is a strong downward current at the center and upward at the sides. The angles of the pan then make a rapid and constant circulation of the pulp.

The muller is open, and never has to be taken out for cleaning up. The center may be got at with a brush. In construction, these pans are quite simple. They separate the pulp direct and even. The pulp, reacting on itself in the peculiar manner described, causes a breaking up and mixing of the whole charge at once. At No. 10 Stevenson street these pans may be seen in operation daily. Three sizes are made. No. 1 has a capacity of 50 pounds, No. 2 works 500 pounds, and No. 3 takes 2,000 pounds per charge.



STRIKE NEAR VIRGINIA.—A despatch from Virginia, Nev., on the 8th, says: Specimens of ore of several pounds weight were to-day brought up from the Keyes and Wheeler mine in Seven-mile canyon. These were taken out of the bottom of the shaft since yesterday, and show both black sulphuret and chloride. All old miners consider the ore very strong in appearance, as well as of the richest character. An assay sample to-day went over $2,600. The streaks now cover a space of some three feet at the bottom of the shaft. There is every indication that a valuable deposit of ore is about to be developed and there is much excitement about the strike in this city.

CALAVERAS.—Dr. J. A. Griswold has bought the hotel, residence, etc., at Glencove, Calaveras county, formerly owned by Mr. A. Lasey; also the quartz mine called the Eldred. He has also located a mine and named it the Victoria, within a mile of the village. Both mines give good prospects, and in due time they will be worked for all they are worth.

NOTWITHSTANDING the high stage of water in the Carson river, it is said that the Gold Hill mines will not be reopened for some months to come. The present increase in water will barely suffice to crush the large quantity of ore now stored at the mills, and it is not considered advisable to again reopen the mines until the mills are fairly able to handle their average supply.

A Copper Smelting Plant.

It is very often the case that miners ordering mills or smelters, find, when they have the main machinery all set, there is much more still necessary before they can start up work. There are always small things necessary for a complete plant for either smelting or milling, and only men of long experience can anticipate the wants, by having everything ready on hand when the first heat is made or the stamps first drop. Just at present smelting plants for copper, lead or galena-silver seem to be more in demand even than mills, and many of them are being turned out in this city by the foundries making a specialty of this class of work. Thinking it would be of interest to many miners to see what is really necessary for a complete copper outfit, we have obtained from the Union Iron works of this city, manufacturers of the Williams water-jacket furnaces, the specifications of a complete plant for a thirty-ton water-jacket copper smelting furnace. This includes a full outfit of tools and supplies for ten days' run, exclusive of fuel: One thirty-ton water-jacket thirty-six inches in diameter at base and forty-eight inches in diameter at top; one firebox boiler thirty-horse power; two vertical engines 8x8; one No. 2 and one No. 5 Cameron steam pump; one 8x10 Blake crusher; one No. 4½ Blake blower; two cast iron plates 4x4 and 1 inch thick; 600 fire brick; five barrels of fire clay; five barrels of fire sand, or ground brick; one redwood tank, 8 feet diameter, 7 feet 6 inches deep; 3,000 gallons capacity; six slag pots on wheels; six bullion molds on wheels; three iron wheelbarrows; two platform scales, 1,000 pounds; one charcoal fork; two scoop shovels; four long-handled square pointed shovels; one hoe; one warehouse truck; one bar octagon steel, 1½x14 feet; one bar 1¼x14 feet; two bars ⅞x8 feet; one bar 1½x5 feet; one bar 1¼x4 feet; two bars 1x4 feet; four bars ⅞x5 feet; one bar ½ by full length; two bars iron, ¼x6 feet; two bars ⅞x6 feet; two bars 1x6 feet; one bar steel, ⅞x1½ feet; one sledge hammer, 8 pounds and one 10 pounds; one blacksmith's hammer and one sledge; one hand hammer; one nail hammer; one hand axe; one mason's hammer; one mason's trowel; three screw-wrenches, 8, 12, 18, inch; one set of pipe tools, ¼ to 1 inch, and one set 1¼ to 2 inch; one sheet of iron, 3-16 inch thick; one sheet of ore ¼ inch thick; ten pounds of washers, assorted; one jack-screw, 1½x18; 100 feet 3 inch manila rope; one set of blocks for same; one set of pipe tongs, ¼ to 2 inch; one bellows, 36 inch; one anvil; one 4 inch vice; one tuyer iron for blacksmith shop; three pairs blacksmith tongs; chisels for anvil; six cold chisels; two pounds copper rivets, ¼ inch; punch and rivit sets; one dozen files; one set of taps and dies, ⅜ to 1½ inch; one ratchet drill and bits; one soldering iron; one hand saw; one carpenter's square; one carpenter's level; six pounds sheet packing, ⅛ inch thick; six pounds hemp packing; four pounds Tuck's packing, ¼ to ½ inch; three balls candlewick; one side lace leather; four pounds copper wire, No. 16; one case lard oil; one case coal oil; twenty-five pounds red lead; one gallon boiled oil; two oilers; four hand lamps; four lanterns; three yards of canvas hose, 12 inch diameter; twenty feet galvanized iron pipe, No. 22, of size suitable for No. 4½ Baker blower; two round elbows for same; fifty feet of 1 inch hose with coupling and nozzle; 100 feet of 6 inch rubber belting; one length of gaspipe, ¼ inch; six of ½ inch; six of ¾ inch; six of 1 inch; six of 1¼ inch; ten of 1½ inch; 100 pounds of fittings, assorted, ½ to 1½ inch; four globe valves, 1½ inch; three of 1 inch; three of ¾ inch; three of ½ inch; 100 pounds of bolts, assorted, ⅜ to 1 inch; one grindstone; assay outfit.

STRONG'S PATENT SQUARE AMALGAMATING PAN.

THE Leadville smelters are all again at work, and there appears to be a free supply of ore.

Mine Managers.

The mining laws of Great Britain are so modeled that certificates of competency as colliery managers are issued under certain restrictions by official examiners to such persons as pass a satisfactory examination. Before submitting to the examination, however, the candidate must present testimonials as to capability, sobriety and general good conduct, and also prove that they have had at least five years' experience in connection with coal mines and colliery work. This system seems a very good one indeed, as mine owners are protected in, that they can demand certificates from those who ask for employment, and are not apt then to get incompetent men. The men, of course, have to have some "theoretical" as well as practical knowledge.

Previous to the examination, each applicant has certain written instructions from the secretary relative to the various subjects that would be placed before him, and therewith he was particularly advised that after entry and previous to proceeding with his examination paper, he must produce sample plan and section of certain colliery workings made by himself, from his own survey and the surveying book corresponding thereto.

An idea of what the scope of the examination is may be gained from the following statement of a recent one: The first subject was arithmetic, eight questions being asked, with a maximum degree of merit of 100 marks; surveying, geology, etc., eight questions, 100 marks; ventilation, ten questions, 110 marks; practical mining, thirteen questions, 150 marks; practical mining, thirteen questions, 195 marks; engineering, eight questions, 105 marks. On the whole, forty-seven questions, each question having a maximum, intermediate and minimum ratio of merit, as fifteen, ten, five, the highest standard on every subject being 660 marks; the lowest, which would admit the candidate to the *viva voce* or final stage, was 330 marks. In addition to this, the candidates are admitted one by one, so as to test their experience and practical knowledge by oral proof and demonstration. If everything is satisfactory, the men get certificates of competency; if not, they are rejected. When successful, they are recognized by the government as men fit to manage the colliery business of the country.

ACADEMY OF SCIENCES.—There were four papers read at the last meeting of the California Academy of Sciences on the subject of the now famous Carson footprints. The first of these was by Dr. H. W. Harkness. C. D. Gibbs, C. E., also read a paper on the subject, and one by Prof. Marsh, from the *American Journal*, was submitted. Prof. Geo. Davidson, President of the Academy, read a paper on these footprints, and this we shall give next week. A committee of the Academy has recently been to Carson to examine the present condition of the tracks. This committee consisted of Prof. W. P. Blake, Prof. Davidson and Mr. Gibbs. The expenses of these investigations have been borne by the income from the Crocker scientific investigation fund, which has enabled the Academy to accomplish much valuable work.

FROM January 1st to July 18th, the Horn Silver mine, of Utah, produced $1,835,500, out of which it has paid two dividends of $360,000 each, and expects to pay another soon.

CORRESPONDENCE.

Arizona Notes.

[From Our Correspondent.]

EDITORS PRESS:—The Dosoris, near Prescot, is still quietly proving up the value of mineral in Hassayampa district. Forty tons smelted at Howell's reduction works yielded $815 per ton; twenty tons sent East yieded over $1,800 per ton. Mr. P. A. Craigue, the superintentent of the company, is now at Howell's sampling another lot of twenty-five tons that will probably average about $800 per ton. This mine has a vein of about five feet, yields chlorides, black sulphurets, native silver and streaks of very rich galena. It is not a "speculation mine;" the Eastern capital invested seems to mean business and development, and not stock gambling. They intrust the management to one of large experience on the Pacific coast.

Col. Bigelow, owner in the Dunkirk mine, neighbor to the Dosoris, reports a large quantity of good ore in sacks to ship off for reduction. Will probably ship to San Francisco. It is grand ore that will pay sacking—"burroing," or packing on donkeys—to the main road, and then to be hauled twelve miles to Prescot; thence again by big wagon sixty miles to A. & P. R. R., or 150 miles by wagon to S. P. R. R. at Maricopa, and then over 800 miles to San Francisco. Yet for lack of funds many prospectors are thus sacrificing on their ores to meet their current expenses. But they expect much relief when the A. & P. road will get the Colorado river bridged, and can open it through for freight and allow a fair competition between San Francisco and Chicago traders and machine works, and also allow the coke men to shade down their prices to a living rate for consumers here.

"The Pine Spring" Bonanza mine of Turkey creek is improving and enlarging as they go down on the claim. Their shaft is now about thirty-five feet, and is yielding rich chlorides and specimens of native silver. The various extensions are also getting a fine chloride ore, and many parallel veins are doing work with excellent results. In Blind Indian canyon they are taking out very rich chloride ores. McCann & Co. are down over thirty feet; ore rich and improving. This district now has promise of producing a large amount of bullion in the next two years. They have regular mails at Bueno Post-office, and though they may send their ores to Denver or San Francisco, they will yet have a margin on their first and second-class ore above all expenses. B. W C.

Weiser District.

To Jas. Smith, who has been prospecting in the Weiser country, the Idaho *World* is indebted for the following items:

The country known as the Weiser district is situated on a spur (running south) of the Saw-tooth range. The Weiser river runs ou the east side of this spur, while the west is drained by Snake, supplying au abundance of water for all purposes. This spur is called the Cudy range, named after Mr. Cudy, who has mills and other property on this spur. Thirty miles from Weiser city is Mineral district. In this district are ledges of copper, gold and silver. The ores are of low grade, but with development will prove very valuable. Twenty miles north of Mineral is Heath district. There are some very fine prospects in this district, and a considerable amount of prospecting is going on. Fifteen miles further north is Galena district, which cantains as good galena prospects as can be found anywhere. This will undoubtedly be the richest district in the Territory. Some of the ores go seventy-five per cent in lead. Forty miles from Galena is the district of the "Seven Devils," or Seven Buttes, which is immeusely rich in copper; also carrying gold and silver. There are a great many locations in this district. I. I. Lewis has three locatious and has them pateuted. James Smith has two good locations. In Indian valley, on Little Weiser, Coruett & Steward have discovered a very large and fine bed of stone coal. Ou Hornet creek and Little Weiser there are placer mines that are being worked by I. H. Paddock & Co. and are paying well. As for farming, Smith says that he bas not seen anything to equal it in this country. T. B. Sams raises on his rauch, ou Crane creek, from 40 to 50 bushels of wheat to the acre; 70 to 80 bushels of barley; 40 bushels of oats; from 12 pounds of seeds 800 pounds potatoes; from one single eye, 5½ pounds of potatoes, average weight of potatoes, two pounds. All the ranches in this vicinity yield about the same. The stock range is of the finest kind, being like one continued meadow. There is an abundance of timber, not growing as high as the timber about here, but much straighter and with less knots. The farmers intend to cut a ditch running the water of Little Weiser into Crane creek, thereby providing water enough to irrigate every foot of land below the creek. In Indian and Counsel valleys the land is of the same kind, and the farmers and stock raisers are doing well. Persons who intend to farm need not ask where to get farming land. If they will go into the Weiser country they will in a very few years become wealthy and owners of valuable property, for in a short time the country will be thickly settled. Washington will be the richest—in farming, mining and stock raising—county in the Territory,

Northern Mexico.

Mining Operatione in the Sierra Madree.

The Tombstone *Epitaph* has enjoyed a pleasant visit from Dr. Samuel J. Moore, an old-time Arizonian, but who for the past eight years has heen a resident of Mexico. This is his first visit outside tbat country for the past six years, during which time he has principally lived at Trinidad, Sahuaripa district, the very heart of the Sierra Madres, although quite a distance below where Crook made his last "conquest." Dr. Moore is engaged in miuing, and in the course of an extended conversation the *Epitaph* reporter picked up the following points which may prove of interest: Large numbers of foreigners are coming into that country in search of mines, farms and stock ranges, and while matters are comparatively quiet,

Capital is not Hesitating

In making investments. At Morres, forty-five miles east of the Trinidad, on the east slope of the Sierra Madres, and in Chihuahua a ten-stamp mill is being put up by Messrs. Chas. Cunningham & Co., of Chicago. Part of the machinery is on the ground, and the rest en route, but as it has to be packed in, the process of transportation is necessarily tedious. The mine being opened by this company is called the Carmen, and is looking well. The lowest workings are about 200 feet, the ledge varying from six to eight feet, and the character of the ore brittle silver. From 500 to 600 tons of ore are on the dump. To

Jesus Maria

Is a distance of five leagues, in a northerly direction. The camp is lively, the Chicago companies operating mines, and at work with the erection of mills. A sawmill will also he put up by one of the companies, the country abounding in timber—magnificent pine, oak, walnut and other woods. The four mines now opened are very promising, while there are other favorable prospects comparatively undeveloped. This section, so Dr. Moore says, is one of the finest grazing countries he has ever seen. Many foreigners are in there, and they meet with no trouble in securing desirable lands. Six leagues north of Jesus Maria is Pinos Altos. The Pinos Altos mine belongs to

An English Company,

Of which Mr. Hepburn, a brother of the deceased John Hepburn, well known here, is the superintendent. A recent strike has demonstrated this property to be better than was ever before supposed, and the company is now at work enlarging their working facilities. The mill, which now bas sixty stamps, will be increased with forty more. Some 250 men are employed, which, outside of machiuists, foremen and other bosses, are principally Mexicans. The product of this mine is principally gold, and shipped to the Mexican Central road. This section is also well watered and timbered.

Uquiva

Is five leagues further east. Three mills have heen put up duriug the present year—two of 5 stamps each and the other of 10 stamps. The first two are now in running order. The mines are showing up most encouragingly, the character of the ore being carbonates. This section is attracting much atteution and large numbers of foreigners are coming in, securing mines, farms, timber lands and stock.

Coming back into Sonora again, and ten leagues west from Pinos Altos, the well known

Mulattos Gold Mine,

Owned by the Ware brothers, is encountered. This mill has 60 stamps, and from 30 to 45 of them are dropping day and night on remarkably rich ore. It is estimated that the mill yields from $18,000 to $24,000, clear of all ordinary expenses, every month. It is proposed to run the machinery by water power in the near future. There are other properties surrounding, but from here to Toracha nothing of importance is met with, save a vast mineral belt, which is principally owned by foreigners. There are a great many old workings in this belt, and in the bottoms of some of these are found very rich ore still exposed to sight. This

Mineral Belt

Even extends to Guadalupe, eighteen miles below Toracha. This country is one of the finest grazing sections to he found in Sonora. In the neighborhood of Guadalupe three Americans are engaged in farming, raising everything that can be produced in any section of the temperate zone. The Indians have made several raids through there, but the damage has always proved slight. So far as the Mexicans are concerned, Dr. Moore gives it upon his own knowledge, acquired in an eight years' residence, that they treat all foreign travelers and sojourners with the greatest hospitality and kindness, and when occasion demands, the people as well as the officials most readily render whatever assistance may he required.

The Trinidad Property,

Dons Padre (Godfather), is owned by Martias Alsuir, and is looking splendidly. The lower workings are at a depth of about 400 feet, and the ore encountered is richer than was ever found above, being brittle silver. A sixty-stamp mill crushes the same.

Sahuaripa

Is a town of about 2,500 population. The valley by the same name is very productive, all kinds of cereals, cane and vegetables being produced. It supports three flouring mills, and much pinocha is made. The steam flouring mill is owned by an American-German, Jacob Beveridge, who is also extensively interested in mining enterprises, having property that prospects splendidly. There are

Other Interests

Which Dr. Moore spoke about that we do not now remember. He stated, however, that an English company were buying a large scope of country from San Marcial east of the Yaqui river. On the lower Yaqui they also have a group of copper mines. Some encouragement has been received from an official of the Sonora railway that a line may he built from a point at or near Hermosillo, crossing the Sierra Madres near Sahuaripa and connecting with the Mexican Central system.

Reviewers have already been over the route, and surveyors are expected in a few months. The means of ingress now is by a wagon road from the Sonora road to Sinope, from the latter point to Sahuaripa the distance being sixty miles. This distance could be covered by a wagon road at a very trifling expense.

The Indian Question,

Dr. Moore said, has not interested the people of his section as much as might be supposed. The Apaches have, as a rule, heen operating on the western slope of the Sierra Madres, some seventy miles north of Sahuaripa, and their stronghold is probably over a hundred miles distant. He thinks Crook's expedition will prove beneficial, inasmuch as the Apaches will now fear attack from this side, an idea they never before entertained. As a general thing they do not hold the Mexican troops in awe. The mineral belt in which the mines spoken of are located, evidently extends into the Indian country, as mines that were worked by the ancients are to be found there.

Red Mountains.

James McBurney, who left Tem Pahute, Nye county, last February, accompanied by Dave Service, and went on a prospecting trip into the southwest corner of Colorado, came into Eureka Tuesday night on his return, and gives some interesting notes of the country and of some Eurekans whom he met in his travels. The place of the mining excitement that he and Service headed for horseback is what is known as Red Mountain, in the northern part of San Juan county. There was quite a rush into the district, miners and prospectors coming in all the time. When he left there were from 2,000 to 2,500 men on the ground. He says the formation of the country is sandstone, and that he saw nothing like ledges or veins, as we use those terms, but the ore occurs in pockets and spots. It is massive galena, carrying pyrites of iron. It is good in quality, but the quantity found so far has been small and uncertain. The mountains are high where the mines are and difficult of access. Freight is packed up altogether on "burros." It struck him as funny to see a load of hay coming into camp on the backs of a train of donkeys. Miners there get four dollars a day; the only place, he believes, in Colorado where they get as much. The few miners that have gone there have the preference in employment, as this State has a reputation for furnishing skilled mining labor. The snow in the winter is very deep, although the weather is not extremely cold. For a long time last winter the snow lay on the ground five feet deep. Silverton, the county seat of San Juan county, 12 miles south of Red mountains, is the northern terminus in that country of the Denver & Rio Grande narrow-gauge railroad, and is the depot from which supplies are obtained and through which travel goes. It is now a lively place. The country generally is fine in its farming and stock-raising resources, which enables mining that would not pay in these parts to be profitably carried on there. As it is, he thinks this country is away ahead of that for miners. On his way out through Nevada and Utah he did not see any mining of importance going on, his road being mostly through small Mormon settlements. On his way back he stopped a while in Taylor district, White Pine county, which, he says, is a lively little camp, with a fine prospect. He returned alone, Dave Service staying in the Red mountains until fall.

Mr. Porter, who used to superintend the K. K. mine on Ruby hill, has charge of the smelting works at Durango. The works have a capacity of reducing 30 tons per day, but are idle at present. Durango is on the railroad, in a fine grazing and agricultural country. Some ore is shipped a considerable distance to Pueblo for reduction at $10 per ton freigbt.

Mr. McBurney thinks there is no comparison between this country and that which he has been examining for the last three months. Miners can do better right here, he is satisfied, than they can there.—*Eureka Sentinel.*

AN IMPORTANT development has been made in the Quien Sabe mine on Cave creek. At a point 300 feet west of the principal development on the main outcrop, an open cut has been run in until the face of the cut is 11 feet high and then a shaft commenced, which, when the letter announcing the strike was written, was three feet deep, thus making it 14 feet to the bottom. The vein there is ten feet wide and exceedingly rich ore—rich in copper, gold and silver. In the open cut back of where the shaft was begun, it was eight feet wide. A sample of the ore sent in, is solid sulphide of copper and silver that will assay way up in both metals. Put upon the forge the metal runs out like so much oil. With the facilities for working this mine much interior ore to this last strike would pay very handsomely.—*Arizona Gazette.*

New Mines in Arizona.

Mr. C. H. Vosburg gives to the Tucson *Citizen* the following items about the new mines in the Quijotoa mountains. They are located about 90 miles nearly west from Tucson, and about 75 miles south of Casa Grande, with a much better road to this place. They were discovered about six weeks ago by a man named McKay, who had prospected that country all through some four years ago. The ledge is just six miles north of the water station on the Gunsight road known as Covered Well. A band of prospectors had been camping there, and found an abundance of float rock containing fine specimens. They kept up for a long time an unsuccessful search for the mother ledge. Where it was discovered was a curious freak of geological formation. On the top of a high mountain there rises the perpendicular walls of a rocky ledge about 400 feet high and from a mile to a mile and a half long. There is only one place where its summit can be scaled, and that is a very narrow and difficult way, that requires a half a day's hard work to get to its summit, which, once attained, is broad and level. McKay told his companions one day that he was going to climb to the top.

One of them remarked he would not climb up there if the top was covered with $20 gold pieces. McKay said he would get there if for nothing else than to "view the landscape o'er." After arriving at the summit almost the first thing he found was a good ledge of rich ore. Prospecting a little further around, he found a deep gorge, down which he descended about 100 feet. Here he found horn silver in abundance. Returning to his companions with his specimens, they could hardly believe their eyes. Locations were immediately made. A specimen out of the bottom of the gorge assayed $4,500 to the ton. The ore is said to be mixed largely with iron, and good either for milling or smelting. Lowering works have been established. A cable 600 feet long has been stretched from the summit of the great ledge to the side of the hill below, and a small car carries the ore down. Several tons are expected in Tucson to-day to be shipped to the smelter at Benson. About ninty men are there at present, and more arriving every day. Every foot of ground is being prospected for miles around.

Transportation of Ores.

The building of a railroad from the Silver King mine to a connection with the A. M. B. road on the Salt river, is more than a possibility. The inducements are many; the cost comparatively little. The road would not exceed thirty miles in length, and it could be of a twenty-four inch gauge. It would pass through the Pinto country and open up its mines to speculation and working. Grades that are impossible to ordinary haulng power are overcome by a gauge as narrow as that mentioned. Three hundred feet to the mile is possible. By the building of such a road the Silver King Co. could have their reduction works on the Salt river, and could increase their capacity to any extent; they could transport ore to their mill as cheaply as they do now to Pinal; they could reduce it at a much less cost; they could get their lumber, firewood and mine timbers at one-third the present cost; owning their road, they could make their own rates; they look to the East as a market for their concentrations; they would, by the building of the road, be hundreds of miles nearer New York; they would be 200 miles nearer San Francisco; all of the costs under which they now groan would be reduced, and some of them removed; living would be cheaper, and so would labor. It would be an advantage to all the mining companies operating about the King and Pinal. It would send money into the Rodger's district, and bring the galena ores of Pioneer near enough to market to make it profitable to handle them. It will be to the country about the King what our road will be to us—its salvation. During the last year the freights to the King and Pinal were not less than a quarter of a million of dollars. All of that business would come to the A. M. B. road. It, with Globe and Pioneer, would make a volume of business that would be immense—sufficient, independent of what would of necessity grow out of the development of the country, to make the A. M. B. road a paying concern.—*Arizona Silver Belt.*

CHEROKEE.—In company with some San Francisco friends we yesterday had the pleasure of a visit to the Cherokee mine. The excellent gentleman who is superintendent, Mr. Garney Williams, courteously received our party and gave the visitors from a distance a most favorable opportunity of seeing the great mine at its best while three great chiefs were in operation. We have been in the mine a dozen times before but never saw it look better. The work seems to be going on in perfect order and very efficiently. Returning, met Mr. Wm. James taking life easy and enjoying the fruits of his earlier intelligent toil. Mr. Waldyer was at home enjoying his books and paper. All the excellent crew who are known to visitors as sturdy business men connected with this huge mine were at their posts. While in the mine, the ladies were delighted to be on hand when a blast of fifty charges was set off. The flood of water pouring into and through the tunnel and beating down the 300 feet of mountain side was a sight to be remembered. —*Chico Enterprise.*

MECHANICAL PROGRESS.

The Electric Light in the Machine Shop.

A correspondent of *Cotton, Wool and Iron* gives his experience in the use of the electric light in a machine shop as follows:

"I have used the electric light in my shop for the past three winters. I obtained the necessary apparatus in 1881 through doing some work for one of the electric light companies. When I first contemplated its use in the shop I had but little faith in it. I was afraid that it would spoil our eyes; that its sharply defined shadows would interfere; that the flickering and unsteadiness would be unbearable, and the first few days' experience seemed to confirm this anticipation. We soon learned that it was not absolutely necessary to look at it all the time, as most of the workmen seemed to think for awhile, and we very soon became accustomed to the light, and to learn that whatever little annoyances we experienced from the flickering were more than counterbalanced by the fact that the whole room was illuminated so that the men could go about, find tools, or do jobs in any part of the room as freely as in daylight. I am speaking of the arc light, and from my experience, and what I have seen of the incandescent plan, I prefer the arc light for shop use."

In regard to the supposed difficulty of working in the shadows, he says:

I have never experienced any such difficulty with my three years' use of this light in a shop working from twenty to thirty men, all on fine or small work, such as hand tooling, small brass work, turning, boring, mitering and drilling, or cutting fine threads, both external and internal. I have never seen a man light a match or use a hand lamp; and as for working under a lathe, I have moved twice in the three years, and in both cases have put the lights into operation the first thing, and have done quite a share of setting up the shop, even including hanging the main shaft at night, and if there is any one place where this light shows at its best advantage it is on just such a job as this. I think it almost goes ahead of daylight for this kind of work; it certainly would do so in many shops in Boston. As for its cost, I have never gone into that enough to give any accurate figures. Of course the power used to drive the dynamo is the principal cost, but in buying fuel for a twenty horse power boiler to furnish power, heat and light, I have never been able to separate the part belonging to the lighting so that I could feel it, and therefore, watever the real cost has been, it has seemed to be very cheap. In regard to the "flickering" he says that unpleasant feature is mostly confined to the use of a single lamp, while in a room filled with lights the flickering is not perceived, as there are no shadows to make it visible. It is like looking for shadows in the daylight. The sun, of course, casts a shadow, but if there were another sun on the other side there would be no shadow, and in a room supplied with a number of electric suns there will be no trouble from shadows.

Action of Mineral Oil on Boiler Scale.

A correspondent of *Cotton, Wool and Iron*, writes that journal as follows: "I will give you a little of my experience in using mineral oil in boilers. When I first took charge of the boiler where I am now I could not see between the tubes, they were so incrustated with a hard substance, principally lime. They had used every known compound up to that time without any effect. I took it in my own hands, and used mineral oil, and washed it out in two weeks, and was surprised to take out one and one-half bushels of scale. I kept on using it, and now have a clean boiler. The proprietor has some of the scale now that I took out five years ago, one-half an inch thick, eight and ten inches long, one-third around the tube. The inspector of the Fidelity and Casualty was here last Sunday, and said that I had the cleanest boiler on record. It is eighteen years old. This oil forms pebbles from the size of a pin's head to the size of a large marble, which are kept in action by the agitation of the water when boiling, touching the seale, and consequently releasing it from the tubes. I favor mineral oil, but not any other kinds, as they contain more or less animal matter which is injurious to iron. I can clean any boiler with mineral oil, and it will not start it leaking unless the boiler is all scale and no iron. The dimensions of my boiler are 56-inch shell, 16 feet long, 70 3-inch tubes, set up in brick. I burn shavings, and can raise steam from fifty to eighty pounds in ten minutes while running the engine and firing, besides heating two large kilns with live steam. My engine is Putnam make, 17x30 inches. I also run a No. 2 and No. 4 steam pump to feed boiler and pump water from canal for boiler and street sprinkler; so you will see, by the work my boiler has to do, that it must be clean to do it so easily. I only make two fires an hour, so you may take my word for it that mineral oil is just boss."

HYDRO-CARBON SMELTING is among the many industries in Boston. At the South Boston iron works, furnaces are being constructed which, it is said, will effetually settle the question of smelting the precious metals by the use of crude petroleum. The Ambler, Eames, Hayden processes have been tried with fair results on erude iron ore by the use, it is alleged by some, of refined petroleum. The cheapness of the crude oils of Pennsylvania having been somewhat tried experimentally and found to answer the requirements only in part, recent inventions are to be put to the severest tests, which the iron as well as the precious metal industry will await with the greatest interest.

Pulverized Fuel.

The use of pulverized fuel, which is also a process for utilizing coal waste, is still attracting much attention, both in this country and in England as well. Crampton, of England, has made some very practical improvements in this direction; but the following brief reference by Prof. Thurston, to the method successfully adopted by Messrs. Whelply & Storer, of Boston, will give a very good general idea of its character and capabilities. In this process, a stream of mingled dust fuel and air is driven into the furnace where combustion takes place, the quantity of fuel and of air being capable of adjustment in such a manner as to secure the most perfect combustion. This method has been applied successfully, not in the production of heat simply, but also in the reduction of metals from their ores. The facility with which an oxidizing or a reducing flame may be produced at will is the great merit of the process in the latter application. Its advantage for heating purposes lies in the power which it gives of utilizing a fuel which would otherwise have no value. In making "muck bar," an economy over that obtained with coal, of above twenty per cent, has been reported to have been effected by the use of this process and fuel. The saving occurred in reduction of waste of metal as well as in simple economy of fuel.

At the United States armory at Springfield, Mass., six and six-tenths pounds of iron were consumed per pound of iron heated to the welding heat, where sixteen had been required by the old process.

Mr. Wootou has devised a grate of peculiar construction, upon which to burn slack coal, etc. His system has been applied to both locomotive and stationary engines, and we believe with good results. It will be found described in the engineering papers of some three or four years ago.

MALLEABLE IRON CASTINGS.—After the pig iron is melted and molded into castings, these are cleared of sand by tumbling, use of acids and wire brushes, then placed in iron pots or boxes, the interstices filled with steel borings and ammonia, the boxes being hermetically sealed and placed in large ovens, also sealed and made air-tight. The ovens are then heated to 3,000 degrees Fahr., at which temperature they are kept from eight to twelve days. The carbon is thus extracted from the iron, escaping in gas. After remaining the requisite time, the boxes are removed and allowed to stand from one to three days, owing to the temperature, to cool before opening. The castiugs are then found to be thoroughly annealed, very tenacious, and stronger than wrought iron itself. In order to remelt this malleable iron, it must be subjected to a greater heat than 3,000 degrees Fahr., which is impossible to secure without a very powerful blast furnace. As an evidence of this the old malleable castings cannot be sold to foundries or furnaces for anything.

THE widening application of steel is a theme which is debated with close interest by the iron trade in all the centers. The latest novel application of that metal applies to gas-making purposes. At the Neepsend gas works, in Sheffield, the drum of a large station meter has been made wholly of this metal. The fact was referred to at the last annual meeting of the Gas Institute of Great Britain. It was pointed out by the president, that in the construction of purifier covers, ascension pipes, conducting and hydraulic mains, and condensers, steel offered great advantages, and for these purposes must ultimately supercede both cast and wrought iron. In this connection it may be remarked as a matter of much interest, that fifty years ago the United States made no steel to speak of, while we now make more than any other nation save England.

A CAST IRON FILE.—One of the interesting inventions shown at the recent Railway Exposition, at Chicago, was a cast iron file, the merit of which lies in its extreme durability as compared with the ordinary steel file. Scientists assert that in hardening cast iron brittleness and want of tenacity increase with the increase of hardness. In the file in question there is from three to four per cent of carbon, and the tenacity as compared with steel bears a ratio of six to one. It is claimed for the cast iron that it is a true carbide of iron, whereas steel is an oxidated carbide. One breath of air while the metal is being reduced to a true carbide reduces it to an oxidated carbide.

BENDING PUNCHED PLATES.—The practice of bending plates after they are punched is probably a frequent cause of fracture along the riveted joints, for the part of the plate which is punched is bent much more than the other part when the plate passes through the rolls, and no doubt incipient cracks are thus produced. Calking, in the ordinary sense of the term, is now rarely performed. A light hammer and light set-tool is used. By these a gentle swelling of the edge of the plate, commencing at the center of the edge, and practically no strain occurs to the riveting.—*Ex.*

SCIENTIFIC PROGRESS.

Telephonic Defects.

There is still much to be accomplished in the perfection of the telephone to make it meet all the demands of practice. For the purposes of communication at short distances it is indeed very serviceable; but when a certain distance has been exceeded, the present capabilities of the instrument are overtasked. In principle there is no limit to the capabilities of the telephone; and though we do not anticipate that the apparatus will ever be made perfect, we may reasonably expect that it will be so far improved as to make it serviceable for intercommunication between distances of several hundred miles. At present, on account of the imperfect character of the insulation of such lines, sounds sent over them rapidly lose their distinctness as the distance over which they pass increases. This is especially marked in the day time, and the practical limit of long-distance conversation is perhaps thirty miles. Under the most favorable conditions, at night, when the confusion of noises which interfere with the proper transmission of sounds is hushed, perfectly distinct siguals are sent and received over distances of 200 to 300 miles.

The reason for this peculiar behavior is to be found in the induction which one electric current exerts upon all others in its neighborhood and which it has thus far been found impracticable to entirely obviate. Thus the very sensitiveness of the telephone gives rise to one of the chief sources of trouble in its use. How susceptible the instrument is may be inferred from the following: If two telephone wires are suspended in the air twenty feet apart, a conversation transmitted over either line will be distinctly heard on the other; and telegraph or electric light wires exert a much stronger influence. Even the cut ends of the wires and the splicings of a telephone line are said to act as small transmitters, and to receive and forward the natural sounds which may be produced around them, such as the singing of birds or the croaking of frogs, so that a conversation over a wire of considerable length has, as it were, to run the gauntlet among the scraps of talk imparted from neighboring lines, the crackling and hammering due to induction from telegraph and electric light wires, and the vague murmur compounded of an infinite number of lesser disturbances; and it is not surprising that it is soon overwhelmed by so many adverse influences.

The Wonders of Electricity.

Hon S. S. Cox, in the annual address delivered before the Indiana Asbury University, at Greencastle, on the 19th ult., said:

"The electric monograph transmits messages in the original handwriting. The hektograph multiplies your epistles; the telephone enables people to make contracts through an orifice; but as there is no witness, photography comes in and records the shadow of the sound by curves in vowels and consonants!

"Electricity is an elemeut elusive and subtle, yet it is stored in a box and imprisoned in a metal to be used at pleasure for portraiture, sound, light, or power. I have seen an organ in Berlin played by electricity, but this is simple compared with other experiments. Is it not a marvel that we can telegraph from a moving railroad car or the speeding steamship? A California photographer obtains six photographs in one leap of a clown in six different positions. He catches a horse on a gallop, a rabbit on a run, and a bird on the wing. By means of a wire a circular saw or a locomotive may be—nay, has been—run miles distant from its source of force. Electricity is horn of the sun. It may be converted back to its source, so that when one talks by telephone he may see his distant colloquist. It is shrewdly believed that nerve power depends for increased strength on light. It will not be strange if the polyscope illuminates the animal organism, rendering the body transparent. The vast current of liquid force which we call electricity is condensed in boxes like desiccated meats, or spread over continents to convey intelligence. Man can never overdraw from this vast, bankruptless depository of nature.

A NEW ART PROCESS.—An invention, relating to the production of photographs upon woven fabrics, has been patented by a London house. The patent has also for its object the preparing or treating of the woven fabrics in such a manner that they will be protected from the action of damp air, and from other atmospheric influences, and will be in a proper condition for receiving oil color on their surface. The process for treating the fabric for the purposes described is as follows: The fabric is stretched on a suitable frame and coated with wax or equivalent fatty substance on the front or picture surface until it appears entirely smooth and compact. After the coating of wax has become hard, the other or reverse side of the fabric is coated with varnish, the latter combining with the wax which has penetrated the fabric. By this process the fabric is effectually protected from atmospheric influences; it is rendered as dense, and non-absorbent as ordinary painters' canvas prepared for painting, and the clearness and depth of the photographic tone is increased to such a degree that the effect produced excels that of photographs on albumenized paper. The fabric may ultimately be painted with oil colors and varnished, and treated in the same manner as ordinary oil painting. The material is very useful for reproducing maps and plans of any dimension, and will be found by engineers to be of great value, both for these purposes and for working drawings, which may be repeatedly cleaned by soap and water, and bear the roughest treatment.

THE CARSON FOOTPRINTS.—Dr. Harkness, who is the father of the theory that the Carson footprints belong to prehistoric man, has discovered in another locality, some distance from the Carson State prison quarry, a series of similar footprints, which are even better defined than those in the Carson sandstone. They have the additional advantage of being covered by a stratum only about one foot thick, which is easily removed. A large area of the sandstone containing these impressions has been stripped. The impressions embrace the indisputed footprints of the wolf, deer and mammoth, as well as the tracks of the creature whose identity the scientists have not yet settled to each other's satisfaction. The Doctor still insists upon the correctness of his theory, for they do not, he says, present a suggestion of a claw mark, which he holds would certainly be the case had the footprints been made by a bear or by a giant sloth. In the footprints of the deer the toes are so well defined that one track can be readily determined as belonging to an old animal. The impression of the claws in the wolf tracks is perfect. The new district is to be thoroughly explored, and for that purpose Dr. Harkness has taken steps to get possession of the land.

MINERALOGICAL NOTES.—Damour describes, under the name of *Jereneiewite*, a new mineral found in southeastern Siberia. It occurs in hexagonal prisms, transparent and nearly colorless. H = 6.5; specific gravity, 3.28; fracture, vitreous; cleavage, absent. It is a borate of aluminium, with some ferric oxide and potassa. In appearance it resembles beryl, tourmaline or apatite. Dr. Doelter describes, under the name of *Dumrieherite*, a new hydrous double sulphate related to the alum gronp, found on the Cape de Verde islands, occurring in crevices of lava in the form of a superficial crust. It was apparently monoclinie, but had a fibrous structure. Soluble in water and astringent. Composition, a double sulphate of magnesium and aluminium, with thirty-six equivalents of water. Prof. H. C. Lewis lately described before the Academy of Natural Sciences of Philadelphia, crystals of serpentine which he had found in the dewelite of Way's quarry, Delaware. The crystals were of a smoky pearl color, with micacious cleavage. The identity of the crystals was established by physical and chemical characters.

HORSE POWER OF BOILERS.—While an estimate of horse power may be made on the basis of heating surface, the only way that the horse power of any boiler can be determined is by actual test of evaporative power. The old rule is that the boiler shall evaporate a cubic foot of water per hour for each horse power; but this evaporative capacity will answer for very coarse practice so far as the engine is concerned. Modern refinements in the steam engine have reduced the amount of water necessary to be evaporated to give a horse power. From fifteen to eighteen square feet of heating surface, and one square foot of grate surface, are required by the same rule for the stated amount of evaporation.

OUR ANIMAL ORIGIN.—It seems to me I can best lay this ghost of our animal origin by drawing attention to the fact that the swinging of any part that is sufficiently free may be used for steadying the body in walking. In man the arms are used, because most movable; but in lower animals the head is most often used. The domestic fowl moves the head back and forth alternately with the movement of the legs; the horse moves the head up and down; the cow moves the nose back and forth. Are these movements ghosts of a former real walking with the head?—*Joseph Le Conte, in Science.*

A NEW BEET-ROOT ACID.—In a paper printed in the Berichte der deutchen chemischen Gesellschaft, May 7, 1883, Edmund O. Lippssiarin, after alluding to the various acids obtained by him, by means of fractional crystallization, from the incrustations deposited by unripe or decomposed beet-roots in the evaporating-pans, (sugar works) states that he has now found a new acid, which he suspects to be oxycitric acid. The other acids found by him in the incrustations above alluded to, are citric, aconic, tricarbyllic, and malic acids.

To obviate these difficulties, it will be necessary to devise a method of insulating the wires so perfectly as to make them proof against the disturbing influences of induction. Thus far no insulation has been found sufficiently perfect to effect this object. But as the whole problem of the universal extension of the telephone depends upon this, it may be safely affirmed that its discovery will sooner or later be made.—*Manufacturer and Builder.*

RIGHT-HANDEDNESS.—It has been observed that "right-handedness" extends far down in the scale of creation. Parrots take hold of their food in their right foot by preference, and insects, like wasps, beetles and spiders, use the right anterior foot most frequently.

Mining Share Market.

There has been more animation in the stock market this week than has been the case of late, yet no developments have taken place that have attracted attention. The movement in the north end stocks was largely due to the annexed press telegram from Virginia on the 7th. "A drift has been started north in ore on the 3000 level of the Union. When it reaches the Sierra Nevada line, that company will take the drift, and the Union folks will cut south in ore."

The following mining companies had a cash balance on hand August 1st: Alta, $3,073.05; Andes, $9,262.80; Alpha Con., $4,350.26; Bodie Con., $25,-643.34; Best & Belcher, $13,022.73; Bulwer, $4,275.-40; Benton Con., $10,036.36; Belcher, $25,824.48; Challenge Con., $5,405.78; Con Virginia, $8,211.26; Con. Imperial, $5,759.19; Chollar, $3,510.41; Crown Point, $23,542.13; Double Standard, $47.70; Day, $4,732.65; Gould & Curry, $35,512.37; Hale & Norcross, $26,326.53; Jackson, $3,367.60; Martin White, $41.58; Mono, $3,139.85; Northern Belle, $16,863,-70; Ophir, $2,017.87; Occidental, $5,945.71; Potosi, $8,108.44; Silver Hill, $2,181.90; Sierra Nevada, $15,608.45; Summit, $1,248.15; Standard, $157,899.-09; Tioga Con., $830.82. Belcher owes the Sutro Tunnel $10,920. Day has bills payable amounting to $91,151.81. Northern Belle has $191,951.93 in unsold bullion besides the above cash.

The following had an indebtedness August 1st: Albion (approximated) $260,000; Grand Prize, $11,-576.62; Lady Washington, $3,938.88; Mexican, to Nevada Bank, July 31, $13,156.06; Savage, $2,110.27.

THE Eureka *Sentinel* says: The French mining experts who visited Centerville, White Pine county, accompanied by ex-Senator Spencer, and examined some property there for a Paris syndicate, will, it is understood, make a favorable report.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ALL DONE AT HOME.—*Dispatch*, Aug. 4: There is every reason to believe that the Pacific and Empire mines are yielding more bullion than ever before and that the facilities for working the auriferous, quartz are better; and that the water supply is so abundant that the mills can be kept running at full blast nearly the whole year round. All the work of extracting the gold from the rock both in the mill and also in chlorinizing the sulphurets will be done on the claims.

KELLY MILL.—*Ledger*, Aug. 4: We visited the Kelly mill the past week. It is running on rock from the Morgan claims. The ore is being taken from two points, one on Hunt's gulch side, the other on Murphy's gulch side. There is considerable difference in the character of rock from the two points. One is a dark-streaked, commonly known as ribbon-rock; the other is lighter, but carrying a large percentage of sulphurets. A cleanup is now being made, and we hope to give the result next week.

THE Lamping gravel claim near Irish hill is being worked by Chinamen on shares. The Kennedy mill is being fitted up for the purpose of crushing a quantity of rock from the St. Louis mine. There is no change in the situation at the Jackson. Baling out water is the only work prosecuted.

Calaveras.

NOTES.—*Chronicle*, August 4: Work at the New Conbination mine, owned by Emerson & Co., is progressing. The main shaft has reached a depth of 65 ft. Machinery is being put up for the purpose of keeping the water out.

El Dorado.

GREENWOOD.—Georgetown *Gazette*, July 28: The rich strike at the Morrell Con. proves to be of more importance than was anticipated. The vein of pay ore continues to improve in size and richness, and the prospects obtained from the decomposed quartz and vein matter are immense. Ricci & Hannay are at work on the Garibaldi. Mr. Ricci has some beautiful samples of gold obtained from this claim, and the prospects in the drift now being run are most flattering. The Union Hydraulic mine immediately adjoining is also a claim of great promise. We understand that parties are in treaty for the purchase of the Union.

Inyo.

KEYNOTE BULLION.—*Independent*, Aug. 4: During the past week the output of gold bullion from Beveridge district, according to the statement of the agents of Wells, Fargo & Co. at this place, amounts to 100 ounces each from the Lasky and McEvoy mills. Both were running on ore from the Keynote, and the result figures up $2,800 in gold. The cleanup at Lasky's mill was for one week's work, and at McEvoy's from six days' crushing.

MONTEZUMA.—Operations of the Owens River Mining and Smelting Co., at Elna, are being carried forward with vigor. Great progress will be made, and it is confidently expected that the furnace will be in readiness to begin operations in 30 days.

SWANSEA.—Most of the necessary material for the new furnace at Swansea has been received, and doubtless the works will be crowded right along.

Mono.

STANDARD CON.—Bodie *Free Press*, July 31. During the week ending July 28th there was extracted and shipped to the mills 1,287 tons of ore; received 2,391 ounces of crude bullion, and shipped to the company this day $14,004.07.

BULWER CON.—During the week ending July 28th the west crosscut from the north drift, 700 level, was driven 12 ft, and is now in 371 ft, in hard ground. South drift from west crosscut No. 1 has been driven 14 ft, and is in 179 ft, showing 1½ ft of vein.

BODIE CON.—*Free Press*, August 1: During the week ending 27th inst. 142.005 tons of ore were sent to the mill, and 146.475 tons were crushed. The average assay value of the pulp was $23.50 per ton; that of the tailings was $4.15 per ton. The shipment amounts to $2,261.88.

DEFIANCE.—Supt. Gorman of the Defiance mine, at Darwin, is making a very successful run of the furnaces on about 600 tons of good ore. This is the property in which Senator Reddy has sunk a fortune but expects to take out a larger. It is an immense smelting proposition, and the railroad will greatly deerease the cost of reducing the ore.

NOTES.—Homer *Index*, August 4: The Virginia Creek Hydraulic Co. is still washing in very rich ground. The Ohio mine on Mount Gibbs was on Friday bonded to W. A. Irwin for $25,000. D. E. Jones will in a few days begin operations on the Johnson mine, Jordan district. Paul Rouze has started up his arastra, in Lake canyon, on ore from the Rocky Point mine, above the May Lundy. The furnace of the Detroit Copper Co., Jordan district, is turning out about two tons and a half of copper per day. Bill Erwin made a cleanup at his arastra below Lake Lundy last Saturday, the result being $42.50 to the ton. Bill worked the arastra as an experiment, and this week began taking out ore from the Clifton mine for an extended run. The Gorilla mine is turning out a large quantity of good ore, and it is the intention of the management to keep the Lundy reduction works running day and night all winter. The May Lundy still has a large supply of ore on hand, at the mill, at the foot of the tramway and in the chutes.

Nevada.

GOLD TUNNEL.—*Transcript*, August 2: It is the talk of the street that arrangements are being made to resume operations on the well-known Gold Tunnel ledge from which in years gone by the California and the Gold Tunnel Companies realized large sums of money, although imperfectly worked. Gold Tunnel was the first quartz mine discovered in the county, the ledge being struck in 1850. A mill was erected in 1851, and although nothing but specimen gold was saved, the results were profitable. Up to 1855 it had yielded over $300,000, none of the sulphurets being saved. It has changed hands two or three times, but has not been systematically worked. Geo. G. Allen obtained a patent for that location and others, including the once famous California, making in all 5,000 ft on the ledge.

LOCKLIN'S.—The 20-ft overshot wheel recently set up at Locklin's mine, on Deer creek, runs the hoisting and pumping machinery in admirable style. The ineline is being put down rapidly, as the developments are highly satisfaetory. The water is taken out of Deer creek 3,000 ft above the mine.

LITTLE YORK.—The mines in Little York township have nearly all closed down for the season, owing to the scarcity of water. At Red Dog, the English Co. have continued the old Greenhorn tunnel into the hill further, so they are now able to continue washing on the Blue Lead. Having built a new reservoir up on the hill they are enabled to turn on a "double header." This claim is run day and night and employes from 12 to 16 men. This is the only claim running in this once prosperous burg. But few houses are left as relics. The English Co., at You Bet, are opening up a drift claim at Wilcox ravine, on the Uncle Sam ground. The report is that they have struck gravel that will justify the erection of a crushing mill. Should underground mining pay at You Bet the town will revive, for there is an immense amount of drift ground here, also lots of hydraulic ground that will pay when water gets cheaper.

THE DEAD RIVER CHANNEL.—*Transcript*, Aug. 2: Jas. Heath, of Pet Hill, and M. Simons and C. P. Crittenden, of San Jose, are in the vicinity of Big tunnel, Washington township, determining a point at which to start a tunnel to tap the vast lead of auriferous gravel that is believed to underlie the ridge separating Deer creek and Steep Hollow. The intention is to penetrate the ridge from the Deer creek side. Messrs. Crittenden and Simons represent two companies organized at San Jose for the purpose of ascertaining the value and extent of the Dead river channel in that region.

LONE TREE.—Grass Valley *Tidings*, July 27: Shortly the Con. Lone Tree will resume work. The property is at Forest Springs and is a location of 3,000 ft, embracing three separate ledges, one of them being 2½ ft thick, and the others averaging eight inches. There is a tunnel on the property 700 ft in length, which cuts all three ledges. Pan washings yielded from $2.50 to $15 to the pan, and much of the gold was in large lumps.

PROVIDENCE.—*Transcript*, Aug. 8: Since the 40-stamp mill of the Providence mine was completed two years ago, crushing has been going on night and day, holidays and Sundays, not one of the stamps having been "hung up" at any time. About 95 tons of ore is milled every 24 hours, and 800 or 900 tons ore is always kept in the ore bin. Enough ore is uncovered in the mine so that the mill could be kept running constantly for 10 years without further sinking or drifting.

Plumas.

MILLS SHAFT.—Quincy *National*, July 28: The tube in the Mills shaft is down 200 ft, and there are indications that it is nearly to bedrock. For several days the drills have been at work on large quartz bowlders. On Saturday it came to a stop, probably on a large bowlder, and a square timber 20 ft long and weighing two tons was hung up by the cable and used as a battering-ram, striking on timbers across the top of the tube. This forces it down slowly. There are good reasons to expect a prospect when bedrock is reached. Pan prospects show fine gold. Mr. Mills seems confident of good results. Should he prove successful, the shaft will lead to operations of a magnitude unsurpassed on the Pacific coast.

EMERALD DISTRICT.—Greenville *Bulletin*, Aug. 1: Major Whitlock has a force of men at work developing the silver ledge in Emerald district. Mr. Whitlock stated that he would continue the work till the vein should be fairly tested. Later developments at the Lucky S. mine are encouraging. In the bottom of the shaft the ore is richer than any previously found. Several of the best informed operators in the county have bought a good deal of the stock, all of which is owned by residents of this neighborhood.

RICH PROSPECTS.—During the past week some rich prospects have been found near town, on the slopes of Green mountain. On the Crown Point ground Will Blood found a prospect that is immensely rich. John Richards brought in a prospect in which the gold is very thickly distributed all through it.

RIVERDALE.—Quincy *National*, July 28: Work was commenced on Monday at the Riverdale mine. The Riverdale is what has been known as the O'Neill ranch mine, and an attempt to open it was made some three years ago by Meylert & Hughes. A shaft was sunk to bedrock, about one hundred ft in depth, and a short drift run from it, from which excellent prospects were obtained. The machinery was too light to handle the water. The Co. now at work have means to open and develop it in good shape. Their machinery, bought in Virginia city, is capable of handling four times the water which will be encountered. The new shaft is located sixty or eighty ft east of the Hughes & Meylert shaft. It will be five ft by ten, in the clear.

San Bernardino.

BURROUGH'S DISTRICT.—*Index*, July 28: For several weeks W. G. Scofield, Supt. of the Ralston Co. of San Francisco, has been inspecting the mineral outlook of San Bernardino. On the Mohave river, four miles north of the Forks, and near John Burcham's ranch, he has organized a new mining district, having discovered ore that promises great richness. Assays gave $475 as the lowest, and $2,561 in gold as the highest, from merely surface rock. Four locations have been made. Mr. Scofield has also sent to San Francisco for analysis, specimens which have a large percentage of platinum.

GARFIELD.—Calico *Print*, July 28: There are 15 men in the Garfield mine. The work is progressing smoothly and with rich results. About 70 tons of first-class ore have been hauled to the Alhambra mill. There are 10 tons on the dump. Work is progressing in the lower tunnel, which is in 70 ft. The main shaft has been sunk 70 ft further to connect with tunnel.

PLUTARCH.—The lessees are chloriding on the east end of the claim, and are taking out good ore. Work has been suspended in the shaft which is down 40 ft. There are about 20 sacks of first class ore on this dump.

ALHAMBRA.—A couple of men are prospecting, and have opened another body of ore. The ore is hauled to the Alhambra mill.

GOBBLER.—Over a dozen men are working in the Gobbler, and are taking out fine ore. This mine is

improving in appearance and is no doubt working in an extension of the rich body of ore that is making the Garfield mine so famous.

GOLCONDA.—The claim is being carefully prospected and ore has been found in a half dozen places. In the center of the claim a shaft has been sunk 15 ft, from which good ore has been taken. About 75 tons of low grade ore that will average $60 to the ton are on the dump. They have 10 tons of fine ore which will be shipped to San Francisco shortly.

BLACKFOOT.—Calico *Print*, August 4: About 30 tons were taken out lately from this mine, which is reported to go $4,000 to the ton. How long this rich sort of affairs will stay with the Blackfoot, we know not.

ORIENTAL.—The Oriental with steam hoisting works and some 25 men are drifting on the 300 level.

MAMMOTH.—The Mammoth is still at work. They use a force of 26 men, and send on an average 15 tons of ore to the mill.

SILVER KING.—No stoppage in the work at this mine and 55 men are rolling out ore daily. They have commenced to work in the old Cunningham tunnel on the fifth level. The last average of ore per ton was $120. battery sample. For the month of July $50,000 go into the pockets of the owners.

ORO GRANDE.—*Times*, July 27: Fourteen bars of fine bullion weighing 1,380 pounds and worth $25,028.40, were received at the express office from the Oro Grande mill this morning. This is the result of 11 days' run on King ore, and makes an even 100 bars so far turned out. The one hundredth bar was carefully packed up and will be sent by Colonel Markham to Milwaukee, where the majority of the company reside.

Shasta.

BELLY CHOOP.—Cor. Redding *Independent*, Aug. 3: Work on the mines is going on as usual. The Mammoth people have run through a five-ft ledge, and are pushing the tunnel. The Cumberland are taking out rich sulphurets. Lockhart and Inghani have made a strike on the east side. The name is the Uncle Sam. Besides free gold, it carries copper sulphurets. Some of our old prospectors have left here for Deadwood.

NOTES.—*Courier*, Aug. 4: Carmer and Arnold were in town from Flat creek mining district a few days ago; where they report mining prospects splendid. Ed. Durfor has a quartz specimen worth $12 or $15 which came from the mines at the mouth of Rock creek. Jones and Son are preparing to erect an arastra on Middle creek to crush quartz from their ledge near the Lower springs. For about 8 months in the year Middle creek furnishes ample water to run a hundred arastras.

Sierra.

NOTES.—Downieville *Messenger*, July 28 Jas. Murrow & Co. are sinking in the river below Shady Flat. The early low water is favorable. The Home Stake mill is not running at present, but workmen are running a tunnel to find a gravel channel. Last week's cleanup of the B. M. N. Co. was the largest the company has ever had. From a little less than 700 carloads, 1861½ ounces of gold was obtained. Taylor & Forbes have a contract for supplying the Four Hills mine with shoes and dies. A. Moran is packing them. At the Rainbow mill, last week, for a run of five hours, $5,000 was taken from the plates alone, the battery not being cleaned up.

PRIMROSE.—Downieville *Messenger*, Aug. 4: P. A. Lamping, Supt. of the Primrose quartz mine, last Saturday stated that the mill has crushed all the rock taken out by the Uncas Mining Co., which paid satisfactorily. The present company does not intend to take out any rock where the Uncas Co. found theirs, but will re-open the shaft of the old Primrose, and extend the lower tunnel to the pay chimney.

THE Bald Mountain Co. shipped $5,000 worth of bullion to the mint last week.

THE Bald Mountain Extension Co, continue to find big pay in the South Fork ground.

Trinity.

EAST FORK QUARTZ.—From Chris. Meckel, we learn that Day, Moore & Hubbard are progressing finely with the work of building a dam, flume and arastra, and that they will have everything in readiness for crushing rock before long. Their ledge is one of the richest ever found in the county. John W. Shuford was in town from Trinity Center this week and tells us that prospecting for quartz is being done in that section with fair promise of success. Mining is as nearly at a standstill in this county at the present time as it ever gets to be. There is no water at all for hydraulic mining purposes, nor yet enough for grinding quartz in arastras. About all the mining that is being done is along Trinity river, the season being particularly favorable for wing damming. Placer miners will soon begin the work of fitting up their claims for next season's run.

Tuolumne.

GREEN MINE.—Sonora *Democrat*, Aug. 4: The lead in the Green mine pinched out or was lost awhile, but last week by changing direction of work it came in again and is yielding very rich ore, with every indication of a large body of high grade rock. Tuesday Wm. A. Clark, one of the owners, brought down the result of the last run in the mill, amounting to over $3,000.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Aug. 4: The connection between the upraise from the 2,600 and the winze down from the 2,400 level has been enlarged to the full size of the winze, and has been timbered up. The ore in the bottom improves in quantity and quality.

UNION CON.—The joint Sierra Nevada west cross drift on the 3,000 level is in vein material of a promising character. In case of the ground becoming less favorable, the drift will be discontinued, and north and south drifts started in the ore already passed through.

SIERRA NEVADA.—The Union Con. west cross drift on the 3,000 level is continued, as the material is favorable. The drift will be pushed so long as it promises well.

ALTA.—Drain boxes are being placed in the drift leading out to the Sutro tunnel on the 1,030 level, and a pump tank is being constructed in the shaft at the same level.

YELLOW JACKET. Some 40 or 50 tons of ore are still being extracted, but owing to the low stage of water in the Carson river, the mills will be obliged to shut down.

CON. VIRGINIA. Have placed the pump tank and donkey pump in position in the joint C. and C. winze at the 2,800 level and resumed sinking. The drift on the 2,700 level is being advanced 10 ft per week.

MEXICAN.—The upraise from the 2,900 level is being advanced as rapidly as the nature of the rock will permit. The main north drift on the 3,100 level is advanced at the rate of 30 ft per week.

UTAH.—The pump-bob station is repaired. Are now ready to resume work in the west crossent on the 1,350 level.

OPHIR.—Repairs to the Central tunnel are completed, and are now opening out and retimbering the drift leading to the old Mexican shaft.

BEST AND BELCHER.—Work in the drifts, which was suspended to allow the water to drain off, has been resumed.

CROWN POINT.—Owing to the low stage of water in the Carson river, there is no ore being extracted.

GOULD AND CURRY.—Work was suspended for a few days to allow the water to drain out, but has now been resumed.

CALIFORNIA.—Have placed the tank and donkey pump in position at the 2,800 level of the joint C. and C. winze, and resumed sinking.

SAVAGE.—Will begin crosscutting on the 2,600 level.

BELCHER.—But little doing owing to the low stage of water in the Carson river.

SCORPION.—The usual progress making in the west drift on the 500 level.

COLLAR.—No further prospecting will be done on the 2600 level until the new hydraulic pump is in operation.

ANDES.—Some quartz giving good assays has been cut in the west crossent.

UNION SHAFT.—Are still repairing the drain tunnel on the 1600 level, and repairing the 23 station.

Belmont District.

SAN ANTONIA.—*Courier*, July 28: The Arlington Leaching works at San Antonio are still running successfully. George Nicholl informs us that the Co. will ship another bar of bullion shortly. Nicholl & Co. have several tons of materials on the way, which will be used in the Ellsworth mill. It is expected that work will be commenced in earnest next week. Work is prosecuted in the Silver Point mines with flattering results. The ore is shipped to the Jefferson mill. The Belmont mine continues to look splendid. The Jefferson shipped a considerable amount of gold and silver bullion during the past week. Chas. Kanrohat, at Jefferson, is encountering rich ore.

Paradise District.

WILD GOOSE.—*Silver State*, July 31: The district has been under a cloud since the Paradise Valley suspended. This spring it occurred to J. V. McCurdy, of twenty year's experience on the Comstock, that arrangements could be made for the resumption of work. He knew by experience at the Bullion mill that the Paradise Valley and Wild Goose ores could be worked by wet process without roasting. He went to work with a will, and succeeded in getting the Paradise Valley to purchase the Wild Goose. He then repaired the Paradise mill, at a cost of several thousand dollars, and expects to start it within a week. We learn from Alex. Wise, who has a contract to haul ore to the mill, that he is now delivering 15 tons of ore daily, and will have 200 tons at the mill when it starts. He says there are 17 men at work at the Wild Goose, 12 of whom are mining. In the lower level, 100 ft from the surface, the vein is 12 ft wide, will average $65 to the ton. In a few weeks the mill will be producing bullion, and some 40 or 50 men will be employed.

Ploche District.

KINGFISHER.—*Record*, July 28: The men working at the Kingfisher mine sent to town during the week a lot of very good looking ore from the ledge recently struck. About 10 pounds was pounded up and assayed, the result being $132.98 in silver.

NOTES.—The prospectors at the new find 12 miles west of Coyote springs have run a tunnel 50 ft in length. A. C. House brought in six samples from there on Wednesday which assayed from $20 to $54. It is rumored in Bullionville that McMahon will start up work on his mining property in Pennsylvania district.

Reveille District.

RICH ORE.—Eureka *Sentinel*, Aug. 5: We received from Reveille, Nye county, yesterday, a singular looking piece of ore, very rich, but so different from ores here that miners would hardly take it to be ore at all. It is nevertheless quartz, carrying some galena, and a large proportion of silver. It is stained with iron and might be taken at a glance for a conglomerate of earth and brick dust. It is the same character of ore, only much richer, that was shipped into the Eureka Con. reduction works some time ago and fooled a number of our local mining experts. Along with the specimen the report of W. R. Norris, assayer, was sent us, and he vouches that it assays $11,386.10 A silver button accompanied the specimen, which was obtained from a half ounce of pulp.

Washington District.

ROMA MINE.—Reno *Gazette*, August 4: Ben. Batolgo, a prospector from Washington district, Lander county, came in town yesterday with what ore he could haul with one horse from the Roma mine. The rock assays from $85 to $800 per ton. His returns from five assays made were $85, $145, $300 and $800. He says he and his partners have run a tunnel in 60 ft, and tapped the ledge, which is 3 ft 5 inches wide.

White Pine District.

OSCEOLA.—Reno *Gazette*, August 4: John Armstrong passed through Reno yesterday and gave a history of Osceola. It is in White Pine county, 140 miles from Eureka and 22 from the Utah line. The mines are gold, both quartz and placer. The latter are idle for want of water, but a ditch 16 miles long will soon be built to bring 3,000 inches from the Snake mountains. The gold is coarse. The gravel is from 5 to 180 ft deep, and goes from 3½ to 25 cents a pan. There are nearly a thousand quartz claims located. The Credit Mobilier has just been sold for $85,000 to Mix & Co., of Aurora, Ills. There are two ledges, and they have gone down 220 ft, and found from 4 to 8 ft of ore, going $31 to the ton. The Fort Wayne claim was sold with it. At a depth of 150 ft the ledge is 12 ft wide, and the level is 150 ft in ore. The Crescent is 208 ft in ore. The Golden Eagle is 150 ft deep. A level 100 ft down is 200 ft in ore. The Cumberland is 120 ft deep, with a drift 32 ft. The Verdi is down 75 ft in the richest gold ore. The Red Monster is 75 ft down—ore worth $34. The Gilded Age is 54 ft deep in $22 ore. The Osceola is 80 ft down, with a drift 75 ft in ore that works $28 at the mill. Gilmer and Spencer built a five-stamp mill a year ago, and Mix & Co. are now putting up one with 10 stamps. Wood is plenty and water sufficient. The camp was discovered in 1874, but it was so far away that it received little attention. No one would believe that there was gold in southeastern Nevada. A hard winter came in 1881, however, and the boys washed $4,500 in gold, and that opened people's eyes, for no one in the camp could raise money enough to salt a claim like that.

ARIZONA.

NOTES.—*Final Drill*, July 28. They are pushing work on the Eureka and Surpriser. Work will soon be resumed on the Rosalie and the Australia. In the Surpriser they are working ten men. The prospect continues encouraging. In the Nacocha, the main shaft has been timbered and the sinking is going on; they are 65 ft down in galena. They employ three men. No wall yet. The ledge is very large.

ROGERS DISTRICT.—Another big strike is reported in the Snap mine. Donahue and Hutchinson have about completed their arrangements to attach steam power to their blower. The Windsor mill and Silver King mill are working as usual. Immense improvements are going on in the Silver King. Arrangements for ventilation are under progress.

BLACK HILLS.—Prescott *Courier*, Aug 3: The new smelter of the United Verde Copper Co. of Black Hills district, 15 miles to the north-east of Prescott, was for the first time charged at 12 o'clock Wednesday. It worked like a charm, and in twelve hours ran out upwards of six tons of copper. The ore carries its own flux. The hundred men in the district felt good over the result. Wm. M. Buffum brought the news to Prescott. He says there is enough ore in sight to keep one furnace running for two years. He says the yield per day will be from 8 to 10 tons of copper, that is, with one furnace.

THAT QUIJOTOA STRIKE.—Tombstone *Epitaph*, July 25th: An *Epitaph* representative met yesterday a gentleman who had made a visit to the new strike in the Quijotoa mountains, in the Papago country. His opinion is not favorable. The ledges are two, running parallel and about two feet in width, on a narrow backbone, and although some very rich ore has been secured—horn silver—no rich float and very little mineral is found at the bottom of the hill. Perhaps the vein can be traced for 8,000 ft, but only on the north end is good rock found, and even where the first locations were made there is nothing to indicate permanency.

TWENTY-EIGHT THOUSAND DOLLAR ORE.—Prescott *Miner*, July 27: Fifty-three pounds of horn silver were to-day shipped to Commissioner Murphy at Denver, by his brother. The ore was from the Pine Spring mine, Turkey creek, owned by Billy Galvin and others, and assays from $20,000 to $28,000 per ton, at which rate it was purchased from the owners of the mine—$595 being paid for the 53 pounds. The mine shows no indication of diminishing in richness. A 32-ft shaft has been sunk in such ore.

COLORADO.

NOTES.—Georgetown *Miner*, July 28: A shipment from the little Emma, on Democrat mountain, ran: first-class, 1,200 ounces silver, 23 per cent. lead; 2d class, 350 ounces. The two classes together averaged 520 ounces. On the Blue Grass, Columbia mountain, Scott Pagan and partner, last week, ran the drift ahead twelve feet. It is now in over seventy feet. The breast shows two ft of fine quartz. Eighteen tons of ore were shipped from the Fred Rogers last week. Eight sacks shipped by Robert Ray milled at the rate of 584 ounces per ton, and netted him $159. Mr. McArthur picked enough off the dump in two and one-half hours to bring him $9.00

MULTUM IN PARVO.—This lode is situated about 1,000 ft above the Live Yankee and a quarter of a mile from the Joe Reynolds, on Silver creek. There are six inches of ore in the bottom of a sixty foot shaft, and all the way down. This shaft was sunk from the bottom of the drift where the ore was first encountered. The last mill-run gave 686 ounces silver. The ore now being sorted, mill-runs from 200 to 300 ounces, and assays 1,000 ounces.

CARBONATE.—The snow is about all gone at Carbonate. The Ryan shaft is still full of water. Some large iron croppings have been found since the snow melted, which look well on surface. There are between 250 and 300 men over there, and they seem much encouraged by these croppings. The country is all staked for miles.

WEST ARGENTINE.—Supt. Vost has eight lessees on the Baker lode, Kelso mountain, and several more picking over the dump. In some parts of the leased premises, twelve inches of solid galena ore, running from 300 to 500 ounces, is encountered. The Richmond lode, McClellan mountain, is now leased from Senator Turck, by Messrs. Linn and Custer, of Silver Plume. They are sinking on a good pay streak and are said to be taking out a ton of ore a week, which runs from 200 to 350 ounces.

IDAHO.

TRAIL CREEK.—Ketchum *Keystone*, July 28: Samuel Huston came down from the Sallie lode, on Trail creek, yesterday, with about 50 pounds of copper silver glance ore. He has discovered a two and a half-ft vein of this, including a slight mixture of white quartz, and thinks he has the greatest mine in the country. Assays made of two samples went 900 ounces and 1,043 ounces in silver respectively, and a high per cent in copper. Messrs. Reynolds, Steward and Williams have a location of the same character, near by and feel equally jubilant.

ELKHORN.—Six ft of galena has been developed in the Elkhorn mine in tunnel No. 1. The miners have been driving ahead in the body for several days, and Judge Lewis informs us that it shows no signs of lessening. This is the largest body of clean, solid galena that has ever been encountered in the Elkhorn up to date. The vein averages three ft. while the largest place is in tunnel No. 3, where nine ft of galena and carbonates mixed was run through.

MONTANA.

ALICE.—*Inter Mountain*, July 28: About 90 tons of ore per day are put through the stamps. Ore is now being taken from the 200 and 300 levels, and a winze is being sunk to facilitate the development of a three-ft vein of 75 ounce rock. The bullion output for this month will be such as to make the stockholders feel very comfortable.

MAGNA CHARTA.—The immense surface strike has been prospected to a considerable extent, and each stroke adds evidence to the vastness of this remarkable chimney of ore. The vein has been found on the 100 and 200 levels.

LEXINGTON.—A 10-stamp salt battery has recently been added to the mill and is working in good shape. The bullion output for the present month is expected to be large.

POSER.—The vein is an immense affair, attaining at some points the width of 18 ft, and assaying from 30 to 100 ounces. At a depth of 80 ft a level has been started west and is now in 70 ft. There are 300 tons of ore on the dump.

NOTES.—The new steam hoist has recently been put up on the Goldsmith No. 2. At a depth of 80 ft, levels are being started east and west. Active operations are to commence on the Josephine soon. In the Moody and Sankey a very rich streak of ore has been struck.

WICKES.—While east Mr. Hauser succeeded in organizing a new company with a capital stock of $3,000,000, which bought out the Alta Montana works and mines, and has ordered the immediate erection of large concentrators and additional furnaces at Wickes.

ANACONDA.—*Inter Mountain*, July 27: The work of excavating for the new smelter began on the 23d. Twenty-five men and eleven teams with plows and scrapers are turning up the ground at a lively rate. One wing of the building is to be 260x150 ft, with 7 floors, and it is to extend into the hill so that all the material can be delivered from railroad cars from the upper floor and pass down in successive processes till it reaches the bottom floor. The furnace room adjoining is to be 350x280 ft. The water is taken from Warm Springs creek. The water is to enter a penstock shaft 70 ft deep to a turbine wheel, which will force the machinery of all the concentrating works.

NEW MEXICO.

BLACK RANGE. Kingston *Tribune*, July 26: J. M. Smith took a small quantity of the Dreadnaught ore and after crushing it had an assay made which showed a value in silver of 23 ounces. He then took a pan and washed the mass down to one-fifth its original size and took another assay which gave 117 ounces of silver. This is a pretty fair demonstration that the Dreadnaught will concentrate with profit. The owners of the Black Hawk up Chloride creek, in shooting out some fresh mineral for the Cincinnati exposition exhibit, brought to light a considerable quantity of native silver. The tunnel of the Pelican mine on the Palomas has been timbered, and four men are hauling out the ore. The tunnel, which is 80 ft long, together with its side drift one way of 14 ft and the other way 30, shows nothing but ore, roof, sides and floor. A fine display of mineral is accumulated to be sent to the Cincinnati exposition. The Dreadnaught sends a 100 pound chunk, which is the monster of the collection. One hundred and seventy two sacks of the richest looking mineral yet mined in the Apache district has been taken from the Silver Monument mine since the last shipment. The first shipment milled $140 in silver; the last gave $240, and the ore on the dump now ready for shipment is expected to yield $500 per ton. The shaft is now 150 ft deep.

SOCORRO. Las Vegas *Gazette*, July 25: The Little Jimmy is being developed as fast as five men can do it. Next is the Bullion. This mine has 400 ft of drifts and one large chamber of mineral which has yielded 500 tons of ore. They are shipping the best ore to the Denver smelters, and are keeping the second grade rock until Kingston shall have reduction works of its own. The ore assays $250 per ton, some of it running over $1,000. Next is the Superior. There are 500 tons of ore on the dump that will average $200 per ton. They are down 230 ft, and are working a pocket of black and green carbonates which they ship without sorting to Denver. Mr. Taylor, the superintendent, states that they are now working in a 20 ft level, which shows high grade ore for 106 ft, and a crossent of 28 ft has not yet found a sidewall. Leaving the Superior, three miles brings us to the Miner's Dream, which has been prospected but little. Within 300 ft of this is shaft No. 1, of the Iron King, which is also a very rich carbonate claim; 200 ft further on is shaft No. 2, which has reached a vast vein of galena, which will enable them to furnish lead enough to flux the hard ores found in the Bullion and Superior, and the lack of which was the great drawback to this camp. The Iron King has 1,000 tons of ore on the dumps, about 80 running 80 ounces of silver per ton. The Soltaire, on the North Perche, is at present idle. They are down about 50 ft, and have some very rich ore in sight. Uncle John Hancock has been sinking a shaft on the Van Wert, and has finally reached good second class ore.

OREGON.

NOTES.—Jacksonville *Times*, Aug. 3: Patterson Bros. have leased their hydraulic mines on Beaver creek. These claims are improving right along. Cleaning-up was finished at the Sterling mine a few days since, with good results. R. W. Dickerson and Mr. Ward, who have been running the quartz mill at Horsehead, Josephine county, informs us that water has failed entirely, causing a suspension of work. A cleanup has been made which, although not a large one, demonstrates that there is some good rock. The Messrs. Caldwell, who have been mining in Steamboat section for some time past, have struck excellent prospects. Their ground is rich and there is plenty of it.

Legitimate Mining.

Prof. J. E. Clayton writes: "I believe in legitimate mining, and think that men should engage in it just as they would in farming or manufacturing, or any other branch of national industry. The first step is to secure good mining property, the next to erect reduction works and commence the manufacture of bullion. Then if the business prospers and dividends can be paid out of the legitimate profits at regularly stated periods, it becomes proper and legitimate to place the property on the exchange lists. I think to do so before the mines are proved to be as valuable as represented, is an attempt (too often successful) to swindle the public."

Montana has been fortunately free from the pestiferous operations of the mining stock sharp. The development of our mining properties so far, has been the result of the legitimate working of the mines for their output of bullion. It was feared that the repeal by the last legislature of the non-assessable stock law, would result in an influx to the Territory of paper mine promoters, who would injure the standing of Montana properties by flooding the Eastern markets with worthless stocks; but happily no such result has yet accrued, and with one or two exceptions no attempt has yet been made to foist upon a confiding public, stock certificates representing property, the value of which only exists in the representations of the promoters. That schemes of this kind can be successfully operated, is a revelation of the credulity of the men who can be thus imposed upon. The more carefully considered investments now being made in mines and promising prospects instead of gauzy stock certificates, must soon change largely the profits of the business of stock mining and add a strong element of strength and stability to the actual development of mining properties.

No field of industry presents more substantial inducements for wise investment of money and labor than the limitless resources of our mineral-bearing Territories. Yet it is a fact that no legitimate and actually valuable line of business has been so basely prostituted by a class of conscienceless sharks, who have deliberately planned to deceive and defraud innocent people. The amount of utterly worthless stock, upon unknown and unknowable mines which never had and never will have a name or existence except in the debased imagination, and on the certificates of the soulless swindler, is marvelous and surprising.

Millions of hard earned dollars have been paid for stocks which are based upon no tangible evidence of value and were issued for the sole purpose of defrauding innocent people. Claims have been secured for the bare cost of location, and so-called mines which were purchased for $50, have been made the basis of a stock issue of tens of thousands of shares and a capitalization of millions. These millions of dollars, thus secured, are not only lost to the legitimate development of our mineral resources which are valuable, but the industry of mining and its immense interests in every State and Territory are retarded, and the capital invested in the prosecution of important mining enterprises has been made to suffer loss from the reproach and suspicion which have been engendered by so many disreputable schemes operated in the fair names of a most valuable and satisfactory business.—*Butte Miner.*

Secondary Bonanzas.

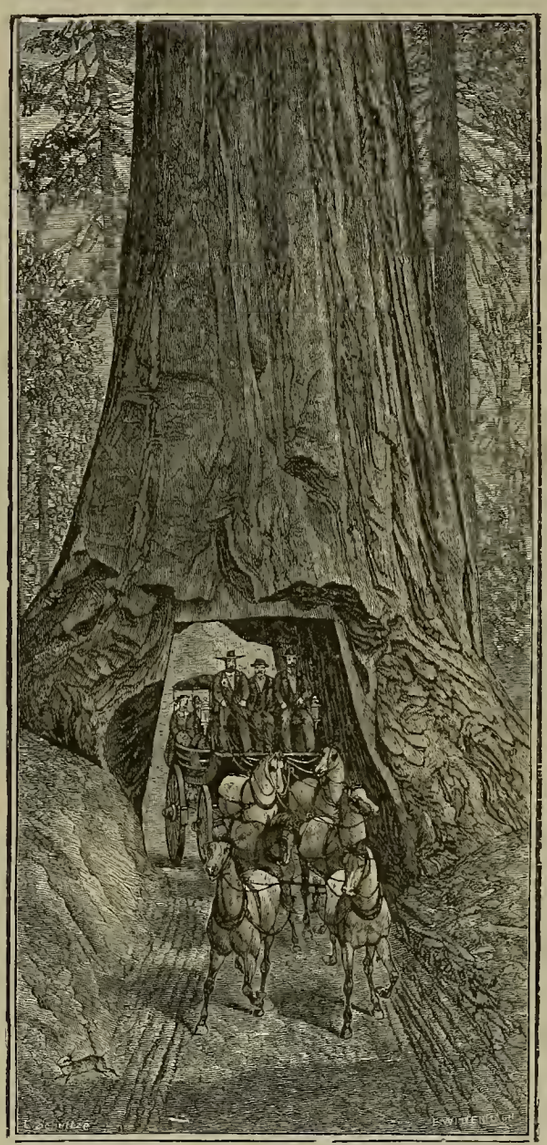
A year ago the knowing ones expected the Horn Silver would have petered out ere this. It was said that the mine pinched on the 300 and 400 levels; that the ore came in 56 feet thick on the 500, but only two feet of it was rich enough to pay, and that production would about cease with the (last) year. The stock weakened to $4. But in sinking from the 500 to the 600 the ore got better, although not so rich in silver as the surface bonanza. A winze has been dropped to the 700, and, as far as can be determined by a winze, the ore grows steadily better to that point. One can get any kind of an assay he wants. The shaft has been sunk and connection is about to be made on the 700 level with the ore body. The manager is no longer so careful to keep people out and to keep his men still as he was.

The stock has recovered to $7 or $8, and there are good judges of mines who regard it as a good purchase at that figure. And truly, a solid vein of clean ore, 50 to 60 feet thick and 300 to 500 feet long, followed 700 feet downward, is no slight indication of many dividends to come. The steady output of 100 to 150 tons a day, and the new lease of life given the mine by the opening of this second bonanza, are very satisfactory, to say the least. If bullion and dividends are what talk, then it must be admitted the Horn Silver has the floor. Also, that the generally unexpected permanence of the mine justifies the long and expensive preparations made by Major Hill, including the building of a new smelter near Salt Lake, before he really put the mine to producing.

I think it encouraging for Utah mines, generally, which it has been too much the fashion to abandon with the exhaustion of their surface bonanzas. There was a time when the Ontario ore yielded but $67 a ton for a year, and a quarter interest was offered at $375,000. After examination the offer was declined, yet since then that quarter has earned and paid $1,230,000 in dividends. The Eureka Hill, now producing more generously than ever before, is in what may be called its second bonanza. So is the Joah Lawrence, Crescent (Pinyon), the Cave; so will, I dare say, be the Emma, the Hidden Treasure, the Crismon Mammoth, Queen of the Hills, and a half score of mines at Bingham and elsewhere. It requires capital, and skill, and nerve and economy, and then the result is almost sure to be favorable.—*Cor. Salt Lake Tribune.*

The Harcuvar Mines.

These mines are situated in the northeastern corner of Yuma county, Arizona, in the eastern foothills of a range of the same name. They are owned, and being developed, by Messrs. D. C. Kling & Co., lately of Leadville, Colorado; these gentlemen having up to the present writing expended upwards of $20,000 in actual work on the premises. They are distant from the city of Phœnix 90 miles by wagon road, and are about 75 miles north of the line of the Southern Pacific railroad.



They show an immense deposit of copper on the surface, in some places the ledges of ore rising over 125 feet above the level of the surrounding country. Here, within a radius of one and a half mile from the enormous central ledge are 24 claims that are being worked by the company, all of them having shafts or inclines from 10 to 40 feet in depth, and showing ore veins with solid footwalls, the veins themselves being from 4 to 40 feet in width, and the ore they bear being very rich in quality.

Some of these claims show a great deal of iron, and one of them is rich in galena.

There is an abundance of wood in the surrounding country, but water has to be hauled a distance of 11 miles from Collin's wells on the old Ehrenberg stage road. Most of the ore dumps are approached by carefully graded wagon roads—the roads in question being, in fact, far better than those provided by the county.

A comfortable camp is centrally located with sleeping houses for the miners, dining-room, stable, etc.

There are at present five different companies negotiating for the purchase of this property. One party has already had their men on the road, while others are following. Two reports have been made by experts, both of which reports agree in placing their estimate of the amount of money in sight at an enormous figure, and there is no doubt that the negotiations now pending will bring about a satisfactory sale. When capital takes hold of them and erects the necessary smelter, these Harcuvar mines will prove to be the largest deposits of copper in Arizona.—*Phœnix Herald.*

WAWONA, MASIPOSA GROVE.

Sheep Ranch District.

One of the most productive mines in the State, the Sheep Ranch, is located in this district. The lode was discovered and located in 1865 by A. P. Ferguson. For a long period the mine was very successfully worked by crushing the ore in arastras. Then a five-stamp mill was put up, the mine continuing to enrich its owners. The original location was 1,400 feet in length, which was subsequently increased 200 feet by the purchase of the Bean claim, a contiguous location. A few years since the mine passed into the hands of capitalists, who have already increased its production by supplying it with all the modern appliances known to quartz mining. The shaft is now 600 feet deep. The pay chute, which is about 700 feet long, has been penetrated by six levels, and the ore stoped out between them. The average daily output of ore is sixty tons; quantity crushed daily, fifty tons. The mill, one of the best on the coast, has thirty stamps. The rock yields an average of $11 per ton; cost of mining and milling, $8.

The Chavanne mine, consolidated with the Sheep Ranch, has a shaft 400 feet deep, and a ten-stamp mill. All the machinery connected with the Sheep Ranch runs by steam. As before remarked, the Sheep Ranch is one of the most productive in the county, and has a very promising future before it.

There are several mines of lesser note in the vicinity, among which may be mentioned the Calaveras, Harrington and Andrews, Wheelock and Rodgers, and Amelia.—*Calaveras Chronicle.*

THE NORTH STAR MINES.—The well-known North Star mines, situated on the east fork of Wood river, and hitherto owned by J. O. Swift & Co., have, it is understood, been purchased by the Philadelphia Mining and Smelting Co. We understand that this company will immediately put a large force of miners on the North Star, as well as to ship what ore is on the dump, 2,000 tons, to their smelters at this place. The showing at the North Star is certainly fine. The mine is well developed, and thus admits of a vigorous working force; in fact, as many miners as the company desires to employ. The ore lies in a good, prominent ledge, and is of a beautiful smelting character.—*Ketchum Keystone.*

Opening Up a Mineral Region.

The southern terminus of the Carson & Colorado railroad is now at Hawley station, on Owens lake, about 300 miles from the Mound House, at the foot of the Panamint grade. Arrangements are now being made for running the trains to and from that point on the first of August.

New Life Given to All Kinds of Business.

As a consequence of the road coming in, a good deal of activity is now being evinced in that section in many kinds of business, and particularly in mining. From the number of valuable mines in that vicinity and outlying districts, a heavy output of bullion may be expected in a short time.

A Smelting Furnace in Blast at Darwin.

The smelting furnace of the Defiance mine, at Darwin, started up day before yesterday, with a large quantity of argentiferous ore on the dump.

Lumber and other material are now being shipped to Swansea, at the head of Owens lake, for the erection of a thirty-ton smelting furnace. The site of this smelter is directly on the road to Cerro Gordo, about six miles distant. The owners anticipate a large and successful business from the product of their own mines at Cerro Gordo.

Rich Ore from the Owens Lake Region.

Day before yesterday a car of ore from the Illinois mine came in to the Mound House. The ore is worth $600 per ton. It is destined for reduction works in San Francisco, and indicates the kind of ore they have down in the Owens lake country.

A Smelting Furnace and Sampler.

The Montezuma company's smelter is now at Bishop creek, and will be sent over and erected near the mine in a few days. This smelter can be run exclusively on a very large body of argentiferous galena ore now exposed in the Montezuma mine, independent of other ores that may be found by adjacent mining companies.

There is a sampler connected with this furnace, it being the intention of the company to buy all smelting ores offered in lots of from 500 pounds to 500 tons. This arrangement will be of immense benefit to the country in the vicinity of Bishop Creek, Alvord (formerly Big Pine), and all the adjacent camps.—*Virginia Enterprise.*

A Specimen Big Tree.

We present our readers with a view of "Wawona," one of the giants of the Mariposa Grove. It is well known that it is only by comparison that people generally arrive at correct conclusions. So discarding bare figures, the illustration speaks more plainly of the size of this mammoth, showing as it does, the loaded coach and six-in-hand bowling merrily through the tunnel hewn through its mighty trunk.

The two noted Big Tree Groves of California are the Calaveras and Mariposa Groves. The former contains the largest trees, but the latter is however more frequently visited by tourists, owing to its proximity to the Yosemite. The grant made by Congress containing the Mariposa Big Trees is two miles square, and embraces two distinct groves. The Upper Grove is in a quite compact body containing on an area of 3,700 by 2,300 feet in dimensions, just 365 trees of the *Sequoia gigantea* of a diameter of from one foot to twenty-seven feet, besides a number of small ones. The Lower Grove, which is smaller in size and more scattered, lies in a southwesterly direction from the other, some trees growing quite high up in the gulches on the south side of the ridge which separates the two groves.

WHISKY SLIDE DISTRICT.—The principal mine in this district is the Hoosier Consolidated. The Hoosier embraces three claims aggregating 3,600 feet. Development so far consists of two tunnels 150 and 200 feet in length respectively. Shaft 140 feet deep, with level at the bottom 130 feet long, shows 8,000 tons of rock in sight. There are also 700 tons on the dump, all of which will pay from $6 to $8 per ton. Six thousand dollars have been taken out by assorting the rock and working it in an arastra, the ore averaging $20 per ton. The Mary Long, one of the constituents of the Hoosier, has a 90-foot shaft, showing a two-foot ledge of $10 rock. A tunnel run in on the pay chute, which is 80 feet in length, furnished ore that paid $25 per ton. Although the tunnel worked the ground to the depth of only 40 feet, upwards of $10,000 were taken out. There are two shafts and several open cuts disclosing a four-foot vein and $8 rock. The vein can be worked by a tunnel to the depth of 950 feet; free water power during eight months of the year; remainder of the time water can be purchased. Two water ditches belong to the property. Ten stamps are to be put on the mine immediately, when it will unquestionably prove a very remunerative property. Whisky Slide mine shows a six-foot ledge of decomposed rock that will pay well. The Livermore mine has a shaft 200 feet deep, and a 10-stamp water power mill.—*Calaveras Chronicle.*

The Engineer.

Engineering and Canal Enterprises.

For a time it was believed that the railroad had literally bidden the canal to "dry up," and that the latter had nothing to do but ultimately to obey. The great Erie canal, however, has managed to hold its own, perhaps because backed by a State so powerful as New York; while Canada has opened the famous Welland canal, and persists in making it the main trunk of a permanent canal system in her territory. Just now a new impulse has for some reason been given to the idea of establishing such a system of water ways in the Dominion. It is proposed, briefly, to parallel the Erie canal by a Canadian system, that shall freight the products of the interior as cheaply as can be done by the Erie, and deliver them at the Hudson river with no less expedition than by their present route. This project is freshly proposed, too, in the face of still larger ones for constructing lines of railway through the whole extent of the Dominion, that are expected to constitute a parallel system to that of the trunk line roads which now traverse New York.

Steam is coming to supersede water power so effectually that it is already proposed to pull down the dams which impede the Connecticut river and its confluents, so as to make a continuous water-way from Lake Champlain and beyond to Boston harbor. The project is by no means so visionary as might appear to the one who had never considered its details. Assuming, however, that it is perfectly feasible, and that water power for manufacturing purposes is every year becoming more expensive to its owner, there is really no serious obstacle to the opening up of a canal and river system of communication with the Northwest, by which for at least five months in every year grain can be transported at low rates to Boston harbor, and here be stored in capacious elevators for foreign shipment. Such a canal system, supplementing and competing with the extended railway system, would work with miraculous influence in forcing forward the superb terminal facilities which Boston possesses to the utmost limit of development and expansion, and make this port an entrepot not surpassed by any on the Atlantic coast. *Exchange.*

The Suez Canal.—The Suez canal has proved a most astonishing success. The original shares of the company, which were $100, are now worth $450, and the last dividend was at the rate of 20 per cent. The traffic on the canal has increased from four and a half million tons in 1880 to seven millions in 1882. The traffic has now become so enormous, and is increasing so rapidly that the capacity of the canal will soon be entirely inadequate to the volume of business. It is in view of this fact that the second canal is proposed. The difficulty involved in this proposition grows out of the jealousy which exists between the French and English governments in regard to its management—the present management being French, under the Presidency of DeLesseps. The English are desirous of constructing a second canal, which shall be entirely under their control. Then, again, another difficulty arises, growing out of the claim of De Lesseps to the exclusive right to all canals across the Isthmus within Egyptian territory. Although the English do not yield their rights to cut another canal, under cover of their protectorship of the territory, still to avoid unpleasant complications, they are now looking for a route outside of Egyptian territory. Thus the matter stands for the present.

The Eads Jetties.—Those cities in commercial rivalry with St. Louis and New Orleans have insisted that the Eads jetties at the mouth of the Mississippi are a failure, and this, in spite of the repeated declarations of St. Louis and New Orleans journals to the contrary. The question has been, or ought to be, settled by the Government Engineer, who, after an accurate survey of the work, reports that there is in the river a channel thirty-one feet deep, and the least width of the thirty-foot channel is ninety feet. From the Gulf to the main river a passage is now afforded 160 feet broad and 26 feet in depth in the shallowest spot. This is better than has been claimed by the New Orleans papers, which believed that a depth of twenty-three feet in the channel as being equal, probably, to the largest vessel that would ever enter the mouth of the Mississippi. If St. Louis and New Orleans are pleased with the situation, that ought to prove satisfactory.

A High-Grade Railroad.—A railroad only 6,000 feet long, but with a grade of one-fifth rise in every five, on the average, and at the steepest, one in three, has been built straight up the Green mountain, near Bar Harbor, Me. The roadbed is solid rock, cut away to a plane, upon which the ties are bolted. The locomotive pushes a passenger car up the ascent by means of cog wheels plying in a center rail, as on the Mount Washington road.

The Mexican Central Railway is completed 105 miles, more than half of the entire distance from El Paso del Norte to the city of Mexico, and 15,000 men are at work in the construction department.

Useful Information.

Paint for Floors.

A paint for floors, which economizes the use of oil colors and varnish, is described in the German technical press as having been composed by Herr Marcck. It is remarked that this paint can also be used on wood, stone, etc. For flooring, the following mixture has been found applicable: Two and one-eighth ounces of good, clear joiner's glue is soaked over night in cold water. It is dissolved, and then is added (being constantly stirred) to thickish milk or lime heated to boiling point, and prepared from one pound quicklime. Into boiling lime is poured (the stirring being continued) as much linseed oil as becomes united by means of saponification with the lime, and when the oil no longer mixes there is no more poured in.

If there happens to be too much oil added, it must be combined by the addition of some fresh lime paste. For the quantity of lime previously indicated, about half a pound of oil is required. After this white, thickish foundation paint has cooled, a color is added which is not affected by lime, and in case of need the paint is diluted with water, or by the addition of a mixture of lime water with some linseed oil. For yellowish brown or brownish-red shades about a fourth part of the entire bulk is added of a brown solution obtained by boiling shellac and borax with water. This mixture is specially adapted for painting floors. The paint should be applied uniformly, and is described as covering the floor most effectually, and uniting with it in a durable manner. But it is remarked that it is not suitable for being used in cases where a room is in constant use, as under such circumstances it would probably have to be renewed in some places every three months. The most durable floor paint is said to be that composed of linseed oil varnish, which only requires to be renewed every six or twelve months. It penetrates into the wood and makes it water resisting; its properties being thus of a nature to compensate for its higher cost in proportion to other compositions used for a similar purpose. Its use is particularly recommended in schools and work rooms, as it lessens dust and facilitates the cleaning of the boards.—*The Builder.*

Glass Blowing by Compressed Air.

According to *Engineering*, the first in France to employ compressed air for glass blowing was probably a workman named Baccarat, who, in 1824, invented a small mechanical blower. A process which has been in use at the Clichy glass works of M. M. Appert, of Paris, since 1879, also dispenses with mouth blowing. Appert's apparatus is capable of blowing the largest pieces of glass, and it is extremely valuable from a humane point of view, as it prevents those maladies of the glass blower which arise from forced expiration and breathing hot, dry air. The apparatus, as described to the French Academy of Sciences, consists of two conjugate compressors put in action by the shafting of the works, and storing compressed air in reservoirs sufficient to serve 12 hours. It is distributed to the blowing apparatus by pipes with cocks, and controlled by a pressure regulator. In the Clichy works the air is employed under three pressures, one of 42 pounds per square inch, one of 14 pounds per square inch, and one of 2.85 pounds per square inch. The last pressure serves for the construction of goblets, jugs, lamps, bottles, and so on. The air is supplied to the glass by giving it an axial rotation similar to that of the blowpipe. The latter is fitted with a stop-cock by which the workman can regulate the air supply. The glass is rotated either on horizontal or vertical axes to suit the class of work. As the pre-acquired habits of the workmen have been consulted in this new apparatus, they readily become used to it. The new machine enables manufacturers to dispense with a number of the children formerly employed in this injurious work.

A Useful Solder.—A soft alloy which attaches itself so firmly to the surface of metals, glass, and porcelain that it can be employed to solder articles that will not bear a very high temperature can, it is said, be made as follows: Copper dust obtained by precipitation from a solution of the sulphate by means of zinc is put in a cast-iron or porcelain-lined mortar and mixed with strong sulphuric acid, specific gravity 1.85. From 20 to 30 or 36 parts of the copper are taken, according to the hardness desired. To the cake formed of acid and copper there are added, under constant stirring, 70 parts of mercury. When well mixed the amalgam is carefully rinsed with warm water to remove all the acid, and then set aside to cool. In 10 or 12 hours it is hard enough to scratch tin. If it is to be used now, it must be heated so hot that when worked over and brayed in an iron mortar it becomes as soft as wax. In this ductile form it can be spread out on any surface, to which it adheres with great tenacity when it gets cold and hard.

To Prevent Oil Fires.—M. Schlumberger recommends that a bottle of ammonia should be placed in each barrel of petroleum. On ignition, by accident or otherwise, the bottle would break and the ammoniacal vapors would at once extinguish the fire. Dr. Pietra Santa proposes to apply this method to collieries liable to fire-damp. Tanks filled with ammonia would, it is said, stop the combustion, as it could not continue in an ammoniacal atmosphere. *Athenæum*

Mud in Boilers.—In cases of externally fired boilers many must have noticed the snapping and bubbling sound at the bottom, after pulling down the fires with a strong draft on, prior to blowing down. This is due to the "mud" (organic and inorganic substances) which has settled during the night, while the boiler was losing heat on the lower side; the water becoming comparatively quiet on the inside. Under such circumstances the boiler may be compared to a pot of boiling mush. The steam bubbles are made at the bottom, underneath the mass of mud, and when sufficiently buoyant, come in contact with the colder water above, and are condensed, forming a snapping noise in collapsing. This never occurs in a clean boiler; with comparatively pure water. *N. H. Williams.*

Fly-paper.—A very good fly-paper may be made after the following receipt: Gum turpentine, 10 parts; yellow wax, 4 parts; lard, 14 parts. Melt, strain through a muslin cloth, and after solidification add as much oil (say linseed) as may be necessary to give the proper consistency on the paper. When prepared lay two papers together, face to face. If the above proportions do not give just the results desired, they should be varied by taking different quantities of the ingredients until a satisfactory material is made.

Scale in Boilers.—Among scale preventives, soap acts on both the carbonate and the sulphate, but the boilers get filthy, and sometimes a corrosive crust is formed. Baric chloride, decomposing the sulphate and liberating the carbonic acid of the carbonate, is largely used in Germany, with milk of lime, especially when the sulphate is the chief trouble. It reduces incrustration and repairs.

Mica Masks.—The use of face masks of mica, for the protection of metal and glass melters, stone masons, and other workmen exposed to heat, dust and noxious vapors, is found to be quite serviceable. These masks allow the eyes to be turned in any direction, and admit of the wearing of glasses.

To Remove Musk Odor.—Sulphate of quinine with a little acidulated water will remove the ordor of musk, perhaps the most pertinacious of odors.

Good Health.

Food Adulteration—Why We are Sick.

No device that can add to the comfort and convenience of a dwelling is omitted in our modern architecture, and money is not regarded when the luxury of clothing or beauty of personal adornment is in question. Hence we all live in better houses and wear better clothes than did our forefathers. Why should we not take the same better care of our health? Why should dyspepsia, and the train of diseases that follow it, almost unknown in the olden time, be so prevalent now? Simply because of the poisonous and indigestible trash which in these days is forced upon the public as a genuine food, or used to adulterate those articles that go to make up the daily bill of fare of every household. Our forefathers were content to make money by plain and honest methods, but the hot competition of the present day and the strife for rapid riches have called forth all the ingenuity of modern science to devise cunning deceptions that shall enable the avaricious dealer to more rapidly increase his profits, even though he destroy the health of the public thereby. The consequence is adulterated, impure, poisonous and bogus food on every hand.

The people buy these adulterated articles of food because they are cheap, entirely ignorant of their poisonous qualities. A few years ago this evil had reached such alarming proportions in England that the public sentiment demanded legislative interference, and Parliament enacted the most severe repressive laws. Dr. Small, U. S. A., after an examination recently made under the direction of the War Department, concludes that the adulteration of food is as great in this country to-day, and of as dangerous a character as it was in England at the time referred to.

It would be well for Congress to take hold of this important matter in a sufficiently vigorous manner to put an end to the whole nefarious business. In the meantime, if people will be as careful to buy the best and purest food as they are to wear the best clothes and build the most comfortable houses, it will not be necessary to ask so frequently the question, "Why are we sick?"

Origin of Yellow Fever.—A report has been received at the State Department, at Washington, containing the results of observations and experiments made by Dr. Freize, a Brazilian physician, who believes that he has discoved the cause of yellow fever in a microscopic parasite found in the blood of yellow fever patients. Experiments made by injecting this infected blood into the veins of rabbits and guinea pigs proved its virulence by producing death, the blood of the inoculated animal showing the same characteristics as that from the original yellow fever victim. The doctor's experiments seem to prove, also, that these parasitic germs of death survive in the soil where the subject of the fever is buried, and from thence may again contaminate living organisms, which would appear to favor cremation rather than burial in the case of yellow fever victims.

Serious Wounds that Fail to Kill.

A short time ago, a shoemaker of Astoria, N. Y., shot himself twice with a heavy pistol, once in the ear and once in the mouth. He was brought to the Roosevelt hospital, in this city, where it was discovered that the first ball glanced from the skull. The other is thought to be somewhere in the head, perhaps in the brain. Speedy death was expected, but the next day the patient walked away from the hospital, saying that he was sorry for the attempt on his life, but appeared to be in no immediate danger of dying.

With this case as a test, a writer in a morning paper reviews a large number of more or less marvelous cases of recovery from grievous hurts, showing that serious injuries to the main organs of the body are not always followed by death. Men persist in living, not only with bullets in their brain, holes in their stomach, dislocated vertebræ, and wounds in the heart, but even with open wounds clear through the body. During the civil war, Gen. H. A. Barnum, of Brooklyn, received in battle a wound which still remains an open passage through the body. For years the treatment of this wound has been simply to wear in it a roll of prepared lint, which is renewed daily. The supperation of the wound is constant, though variable.

Gen. Shields, of Missouri, had a similar wound extending through his body, and open in front and behind. His wound, it is said, was received in the Mexican war, and he wore, not lint, but a silk handkerchief in it. This he could draw directly through his body. *Scientific American.*

Action of the Heart.—As with each stroke the heart projects something like six ounces of blood into the conduits of the system, and as it does so some seventy times a minute and 4,200 times an hour, this implies that it does the same thing 100,800 times in twenty-four hours, 30,000,000 times a year, and more than 2,500,000,000 times in a life of seventy years. The mechanical force that is exerted at each stroke amounts to a pressure of thirteen pounds upon the entire charge of blood that has to be pressed onward through the branching network of vessels. According to the lowest estimate that has been made, this gives an exertion of force that would be adequate, in another form of application, to lift 120 tons one foot high every twenty-four hours. Yet the piece of living mechanism that is called upon to do this, and do it without a pause for threescore years and ten without being itself worn out by the effort, is a small bundle of flesh that rarely weighs more than eleven ounces. It is in the nature of the case, also, it must be remembered, that this little vital machine cannot be at any time stopped for repair. If it gets out of order it must be set right as it runs. To stop the beating of the heart for more than the briefest interval would be to change life into death. The narrative of what medical science has done to penetrate into the secrets of this delicate force-pump, so jealously guarded from the intrusion of the eye that it cannot even be looked into until its action has ceased, is, nevertheless, a long history of wonders. By means of the spygmograp—a writing style attached to the wrist by a system of levers and springs—the pulse is made to record actual autographs of cardiac and vascular derangement.—*Edinburgh Review.*

Inhalation of Air Exhaled by Consumptives.—Fresh proof of the danger of inhaling air exhaled by persons having lung diseases has been given by a characteristic French experiment. M. Giboux took four young, healthy rabbits from the same litter, and kept them for 105 days in cages, as follows: Two were placed in a cage where they were obliged to breathe the air expired from animals with consumption, twice a day for two hours; in a short time they became sickly, and on killing them, they were found to have tubercles in the lungs. The other two breathed twice a day the same air, but disinfected by being passed through cotton wadding impregnated with carbolic acid: these rabbits remained in good health, and were finally eaten by the experimenter.

Disinfectant for Sewers.—It has been discovered that the best disinfectant for sewer gases is the washings from gas works. This serves a double purpose—that of annulling the poisonous effect of the sewer gas and at the same time enabling persons having defective traps to detect it by the strong, pungent odor arising therefrom, while sewer gas alone, almost odorless, permeates the building, carrying sickness and death with it. The washings from gas works, at least, will not clog or obstruct even the smallest of sewers, while their presence, as above stated, might save life.

The Bite of the Leech.—The nature of the bite of the leech has been examined by M. Carlet. He detached the animal from the shaved skin of the rabbit at different stages. Suppose a scarifier, with three-toothed and equidistant blades, withdrawing from one another as they press into the skin, and operating several times successively in the same place; this gives a pretty exact idea of the mechanism.

Passing Events.

The city is just now busy in preparation for the Conclave week, and the Knights Templar are arriving daily. Many buildings and public places are being finely decorated, and San Francisco will soon be a gala array. The Governor has made a legal holiday of that on which the corner-stone of the Garfield statue in the park will be laid.

Mining news of moment is not abundant just now. The Lower California placer mines are again attracting attention. The impending strike at the Wellington collieries, B. C., will have some effect in our coal supply here, possibly. The advance of the cholera into China is not by any means assuring, and steps are being taken to enforce a rigid quarantine.

WELLINGTON COLLIERY STRIKE.—The miners at the Wellington coal mines, British Columbia, have notified the proprietors that it is their intention to go on a strike, for the reason that they have demanded an increase of pay. There are 300 miners engaged at the mine, and the threatened action will throw out of employment not only themselves, but upward of 1,000 others, who are engaged in various capacities at and around the mines at Departure bay. About 14,000 tons of coal a month come to this port from these collieries. It is stated that the colliery miners intend bringing about 1,000 Chinamen from China to work in the mines.

Lodes in Placer Claims.

The conflicting interests of lode and placer claims, particularly as connected with the side surface ground of the former, are constantly coming to the front. A short time since a lode owner filed an application for patent on a lode, part of which was on a placer claim owned by others. The placer owners asked the Land Office to dismiss the lode application on the ground that the greater portion of the lode claim was on their placer claim.

The Land Office, on denying the motion to dismiss the application, held that there existed prior to the date of application of the placer owners, the lode claim referred to, and as the vein or lode was known to exist, it was expressly excepted from the patent of the placer claim. The matter was appealed to the Secretary of the Interior by the placer owners. It appears, from a copy of certificate of location filed, that the Mandelle lode was located March 21, 1879, by John McKenzie, A. A. Swan and Thomas Guest. The application for the Searl placer was filed July 5th, and that of the Olathe July 7th, 1879. Finn claims, under locations made by himself May 10th and June 11, 1881, and also claims, through various conveyances, to be possessed of the claim originally located by McKenzie, Swan and Guest, and that they are one and the same lode or claim.

In the case of Becker et al. vs. Sears, the Hon. Secretary of the Interior held that Section 2333, U. S. R. S., carves out from a patent to a placer claim all known lodes found therein *at date of application*, together with twenty-five feet of surface ground on both sides as incident thereto. The Secretary did not think he had sufficient evideuce before him showing that the lode in question was really known to exist at the date of the placer applications. Furthermore, it does not appear that the lode claimant filed any adverse claim against either of said placer applications, and having failed to do so within the statutory period, he had to, under the decision of the Hon. Secretary in the case of the Shonbar lode, if entitled at all, be restricted to his lode claim, and only twenty-five feet of surface ground on each side.

The Secretary decided that before application for the lode claim can be received, applicant must affirmatively and satisfactorily show his acquaintance with and the actual existence of the lode and mine, and its true location within the placer, and that existence was known prior to date of the placer applications, and he must set forth such facts as clearly show how the existence of such lode at that time became known, and a statement under oath of mere conclusions or opinions will not be sufficient to establish the existence of the lode. Applicant's affidavit must be full, clear and specific upon the points indicated. He must also prove his possessory right and value of work as in other applications, and, in additiou to the other proofs required by law and official regulations in mining applications, the allegations of applicant above mentioned must be satisfactory and fully corroborated by at least two disinterested and credible witnesses familiar with the facts. Such a showing the applicant failed to make.

The Secretary of the Interior, however, instructed the Commissioner of the General Land Office that, should applicant make such showing and present such application under oath for the lode, showing its actual location and extent by plat and field notes, such application, restricted to the lode and twenty-five feet of surface on each side should be received, and applicant allowed to proceed under the statute.

For the reasou stated, though, the applica tion of the lode claimant, upon his showing, was rejected.

MINING ENGINEERS.—The autumn meeting of the American Institute of Mining Engineers will be held at Troy, N. Y., during the second week in October. This meeting will be mainly devoted to the reading and discussion of papers. A feature is that members who wish their papers fully discussed at the meeting, can have them printed and circulated in advance if they are sent to the Secretary early in September.

TUOLUMNE.—Mr. Fred Asbeck of Soulsbyville, Tuolumne county, tells us that he has bonded his mine, and it is being prospected so far with success. There is renewed activity in mining about Soulsbyville, for several companies have started up again.

Falls of Roof and Sides.

It is the experience of coal mining that the falls of roof and sides by which lives are lost are almost always the result of the carelessness of the miners. Some men, either from natural fearlessness, or from the daily contact with and exposure to danger, become so reckless that an accident is almost certain to overtake them sooner or later, and not only their own lives, but those of their partners, or those less skilled, who may be working with them, are placed in jeopardy. It is noticeable, too, that fewer accidents occur in places which appear the most dangerous, owing to the care with which they are treated, and to the great attention paid to the timbering; and no stronger proof can be wanted that many of these casualties might be avoided if closer and more systematic examination were made by the workmen themselves, as well as by the overmen, firemen and other responsible officials of the colliery.

There is the greatest possible difficulty in making the workmen attend strictly to the special rule requiring sufficient "sprags" to be kept set while they are engaged in holing under the coal. If the rule received constant attention, there would be very few accidents. If temporary props were placed under the roof whilst the men are loading, it would enable them to save themselves when they first hear a breakage in the roof; but the prevailing practice is to do all the work of removal under the roof after the support has been taken away, and then do the permanent propping. A source of danger which is but too often disregarded, arises from visible slips in the roof. In this, both the colliers, the firemen and the managers are to blame. As blame is so often attributable to all concerned, it is very difficult to bring a charge home to a manager for even a gross neglect.

Falls of roof often occur by reason of an insufficient testing and watching of the superincumbent strata; sometimes they can be traced to the venturesome folly of working under a roof carelessly, and often insufficiently supported. Others arise from the neglect of the observance of the special rules with respect to the spragging underneath the coal before holing the same. In an occupation such as this, accidents from falls must necessarily occur, but they are not at present reduced to a minimum. Frequent supervision is absolutely necessary, but this alone will not have the effect so much to be desired. The workmen who are continually in their places ought to be always on the watch, and it is their duty to place timber at stated distances, whether required or not; and often it is unwise to trust to any fixed rule; but in cases where the roof is tender, and consequently treacherous, they should timber accordingly. It is better far that a little extra labor and consequent loss of time should be given than run any needless risk.

For the most part the timbering of the roofs at the faces, where most of the falls occur, is done by the colliers themselves, and therefore their safety is, in a great measure, dependent on their own care and skill. The workmen for the most part set their own timber, though generally speaking, they do not draw it. This is done by a class of men for the purpose. During the shift, the men themselves are, or ought to be, the most competent judges where and how to set props, by reason of their remaining in the place the whole time, and being able to form a judgment from surrounding circumstances; but at the same time those in charge are answerable, and very properly so, for the fulfillment of this necessary duty. The importance of enforcing a system of regular propping is urged upon miners by the English inspectors of mines. This is now practiced in a great measure at pillar working. When the mode of systematically removing pillars on a large scale was first adopted in Scotland, propping of the roof was conducted on very much the old style of propping where the roof appeared to be unsafe, and the consequence was, that there were more accidents from falls of roof than in any other mode of working. Gradually since then the adopiton of the better plan of setting up an excess of props beyond that needed for the actual safety of the miner, has been introduced, whereby the roof is thoroughly steadied until the coal is removed, and there are now fewer accidents. The wood is also drawn out with greater safety. In longwall, on the other hand, the general practice is only to prop the roof where it appears to be unsafe.

Color Tests for Ores.

During the first part of the process of scorification of ores that have not been roasted, or only partially so, the colors of the fumes given off will often indicate the nature of the ore. Thus sulphur emits clear gray vapors; zinc, blackish vapors and a brilliant white flame; arsenic, whitish gray vapors; and antimony, fine red vapors.

The colors shown by the interiors of scorifiers, after scorification, are often characteristic, and Mr. Walter Lee Brown, in his "Manual of Assaying," gives a short list of colors in scorifiers which are of interest to miners. Lead tends to color the scorifier a lemon yellow. Iron colors it in various shades of reddish-brown, from a brick-red to a deep, rich mahogany. Copper, according to its percentage, gives a green, varying from a brick-red to a deep, rich mahogany. Copper, according to its percentage, gives a green, varying from light to very dark. Tellurium colors the scorifier a deep blood-red. Combinations of the metals are liable to influence these colors and produce mixed shades.

In addition to these colors in scorifiers, the color and appearance of a cupel are occasionally indices of the metals present in the ore. We quote from different authorities on this point:

Antimony—Litharge-yellow to brownish red scoriæ. Cupel often cracks. (Mitchell.)

Arsenic—White or pale yellow scoriæ. (Triplett.)

Besmuth—An orange-yellow color. (North.)

Chromium—Dark brick-red stain. (Triplett.)

Cobalt—Dark-green scoriæ, greenish stain. (Triplett.)

Copper—Dark brick-red stain. (Triplett.)

Cobalt—Dark-green scoriæ; greenish stain. (Triplett.)

Copper—Dark purplish-black stain, sometimes with a greenish cast, or even a brown; at times a gray or dirty red. The edges show a purplish-red tint. There is generally a *rose* coat on the outside of the cupels from ores such as copper, which need not be mistaken for the rose color of oxide of silver. (Brown.)

Iron—From light through dark-brown to almost black; corroded rings or cupel. (Brown.)

Manganese—Lemon-yellow, straw or orange-yellow.

Palladium and platinum—Greenish stains and crystalline buttons. (Triplett.)

Tin—Gray scoriæ.

Zinc—Yellowish ring or cupel; often causes loss of silver by ebulition; flame very luminous. (Brown.)

Lower California Gold.

The recent excitement about the Lower California gold mines seems to be about reviving. It was at first announced with great flourish that very rich placers had been found, and that many miners were rushing there. Then came the news that many who went were greviously disappointed. There was less gold than was expected, and there was no water at all. The whole thing quieted down. Now, however, comes a dispatch from Guaymas, dated the 8th inst., which brings up the matter again in the following form:

"By the arrival to-day from Trinidad of the sloops *Emelia* and *Sarregosa* the following startling news from the placers is brought: Prospecting has been persevered in, and the present extent of the placers is some forty by sixty miles. Rain has fallen, and water for drinking purposes is plenty, but the ground in such a condition that dry washing has been abandoned for the present. Provisions also have nearly given out, but a train is now on the way from here. Flour is scarce at $2 a pound. Beef, none to be had; also coffee and sugar. Jose M. Garcia came over on the *Emelia*, and will leave on her return with a stock of provisions. The two vessels brought over some thirty pounds of gold, in the hands of the different passengers, two of these pieces being remarkable for size and richness, the largest weighing, rock and all, eight and three-fourth pounds, and the other, solid gold, four and a half pounds. Up to the time of the rainfall the dry washers were making from $20 to $30 per day."

By the same mail comes the news that a Mexican gentleman, named Juan Diaz, had died of thirst at the placers. And also a speck of trouble in regard to the placers, from the fact that there are two parties claimiug the mines. Altogether, this part of Lower California needs to be very rich indeed to tempt a man to try his fortunes there.

Blocking Out in Alluvial Mines.

The following description of a system of blocking out followed in the alluvial mines at Huntly and Bagshot, Bendigo, during the past seven years, is taken from a special report on the subject by H. B. Nichols, Inspector of Mines at Sandhurst. He says that no accident has occurred from a fall of ground since the system was first introduced in these mines. The main and block drives are timbered, as shown in Figs. 1 and 2. These blocks are commenced at sixteen feet from the main drive, as that distance is considered necessary for the security of the permanent works. In Figs. 1 and 2 the laths overlap, and are placed in dry ground the distance apart shown, whilst in very soft or wet ground each lath stands separately on its own timber and close together, as shown in Figs. 3 and 4. In each case the laths and props decrease in size from the drive towards the back of block, because it is considered desirable to allow the ground at the back of the block to collapse as soon as possible after the "bottom" (wash-dirt) is taken off. The maximum thicknesses of the props and slabs used near to the drives are five inches and one inch and a half respectively, and the minimum thicknesses at the back of the blocks are one inch and a half for props and three quarters of an inch for slabs. If the block or roof stands up any time, is swaying, or, to use the miners' term, "talking," the props are knocked from under the back laths and the block is let down, thus relieving the front laths of the weight and saving the drive from crushing. This method of blocking is the safest and cheapest way to work alluvial ground. The safest, because each lath stands on its own timber, and there is no shaking of the roof by driving laths and no fear of knocking the timber out; and the cheapest, because the timber is lighter to handle, cheaper in price, no false sets are used, nor anything cumbersome. If the ground is very soft or heavy, the blocking drives are put in first, and the miners then block back on both sides and let the ground down in working back. In dry ground they take the block up on one side of the drive, as shown in Fig. 1, and bring it back on the other, always letting the roof down at the back.

In driving, the sets shown in Figs. 1 and 2 are considered the best. If the ground is very heavy, the cap of the set over which the laths are to be driven is dogged with two strong iron dogs to the back sets which have weight, and a horned false set is used. This is very quickly done, if, when the set is made, an auger-hole is bored in each end of the cap; it will then be ready for dogging, and when the set is up the dogs are easily withdrawn. In driving through heavy ground four-foot slabs are generally used, and occasionally slabs of four feet six inches. In blocking out, however, four feet six-inch slabs are always used.

When the alluvial drift in which the mining operations are carried on becomes very heavy between each set, a "dummy" prop and cap are added. The props are eight to twelve inches in diameter, and the caps used are two to three feet long by six to eight inches in diameter. These are put in to protect the drive, as shown in Fig. 5.

In working very soft ground by this system, and supposing the miner to be in the face, or commencing to block out, he takes a lath six to eight inches wide, and a prop about two inches in diameter, each of the required length; he places the prop under the center of the lath, which he holds with one hand against the face, and, with a light pick in the other hand, he scratches away the drift (sand) in front of the lath until it is in the full width; then, placing a prop under each end of the lath, he removes the center prop and takes out the wash-dirt.

One manager of long experience in this division, in describing this method of working soft ground, says; "I have seen miners put in laths by holding the center in one hand, forcing the lath against the face, and with the fingers of the other hand work out the sand until the lath was in its place; then prop the ends, remove the center and take out the wash." He further mentioned, to show the superiority of this system as compared with the old one, "that he had seen a miner working in ordinary ground, using two foot nine inch props, excavate a block four feet wide by sixteen feet in length in eight hours, and at the same time, as his work progressed, he put in sixteen laths and twenty props. This was in dry ground, where the laths lapped, and were placed one foot apart." Under the old system of blocking out and excavation, four feet wide by eight feet long is considered a good eight hours' work.

Foundry Notes.

Savage and Sons.

Messrs. Savage and Sons are proprietors of one of the old foundries in this city, having been in the business altogether some fourteen years. They have several specialties, among which are house front castings. They did this part of the iron work on both the Palace and Baldwin hotels, and many other large buildings in this city. They have just finished two large iron fronts, one of which is for the Sandwich Islands. They are at work now on the cast iron for the addition to the State Insane Asylum. The foundry has always done a large amount of this house work.

A specialty is also made of sawmill work, modern sawmill machinery of the best type being manufactured. They are now engaged on a mill for Bellingham Bay, to cut 100,000 feet of lumber per day. Heavy engines are made to accompany this class of machinery.

Another thing of which large numbers are being made here is the Dodge rock breaker, for which the trade is increasing since the recent improvements by the inventor. Steel pins are inserted in the wrought iron crushing faces, which makes the crusher more durable and effective. Mainly two sizes of these machines are made. They also make the Dodge concentrators, dry and wet, and the Dodge pulverizer.

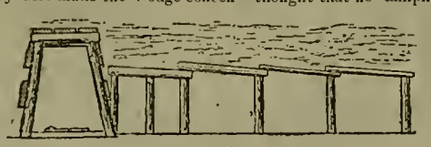

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

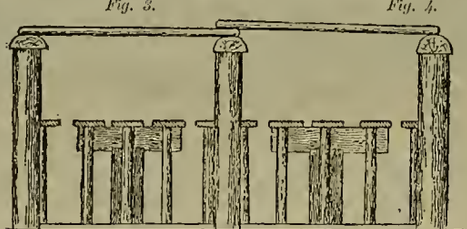

Fig. 5.

BLOCKING OUT IN ILLUVIAL MINES.

Another specialty of these works is the French range, of which they make great numbers for the wholesale and retail trade. The demand for these is general all over the State and coast. Mantel grates and light cast-iron pipe, with fittings for plumbers' use, are also made.

They do general jobbing work for the smaller machine shops that have no foundry. Jobbing work is light, however, at present.

Among other things of which this foundry makes a specialty, is ship work. They make gypsies, house pipes, chocks, and all that class of articles for vessels. Trade has been good in this branch this year. Among other things on which they are at work just now are the two curves complete for the Sutter street cable railroad. These curves are to be put in at Polk street.

THE Trinity *Journal* of August 4th says: Mining is as nearly at a stand-still in this county at the present time as it ever gets to be. There is no water at all for hydraulic mining purposes, nor yet enough for grinding quartz in arastras. About all the mining that is being done now is along Trinity river, the season being particularly favorable for wing-damming. Placer miners will soon begin the work of fitting up their claims for next season's run.

LORD DERBY has advised the Australian Colonies to take the eastern half of New Guinea and the Western Pacific islands under their joint protection on their own responsibility. He said he could not advise the government to extend the Queen's dominions any further.

ALL cattle arriving at ports of the United States from any part of the world, except North and South America, will be subject to quarantine for ninety days from the date of shipment.

Blasting in Mines—No. 3.

Tamping with black powder, clay is perhaps best, but soft rock, sand, etc., are often substituted. The idea of using plugs, cones and similar devices for blocking the hole is apt to be periodically revived by enthusiastic inventors. Their history dates back through the last two centuries. There have been several attempts to introduce them into use of late years in the United States, but it is hardly worth while here to notice any of the proposals, as they have not come into general use. With pure nitro-glycerine, no tamping is needed but water; therefore, nitro-glycerine, having greater specific gravity than water and no affinity for it, is an especially suitable agent for subaqueous blasting, where it can simply be poured down into the holes through a tube and funnel. Where the rock is split or seamy, nitro-glycerine must be encased in some substance, say tin cases, and this, it is said, lessens its explosive force by preventing close contact. Where the rock is firm, it can be poured directly into the hole. In this respect dynamite has a great advantage over nitro-glycerine, in that it can be charged in roof-holes and in seamy rock, there being no danger of running out, leakage, etc. In charging No. 1 dynamite, it was formerly thought that no tamping would be required, but the general experience of blasters has led to the practice of tamping the holes solidly to the lip with clay. The fact that tamping is not so essential with the high explosives as with the lower ones, should not be taken as proof of any radical difference in the theory of tamping being required in both cases. The law of tamping is the same, for in both the disruption is effected by the sudden liberation of expansive gas; only in the one case the liberation of gas is instantaneous, and in the other gradual. In either case, strong confinement promotes the effect.

The vacancies about a charge do have a practical effect in reducing the force of explosion of nitro-glycerine or of its compounds is shown by the following record. The experiments were made at the works of the Atlantic Giant Powder Company with the mortar. The charge used with each shot was one-quarter ounce of No. 2 dynamite, and the object of the experiments was to see whether a small space left between the ball and the bottom of the bore would have any appreciable effect in lessening the distance the ball was thrown:

	Shot Raised.	Thrown.	Loss.
No. 1	00 inch	630 feet	00 feet.
No. 2	1-20 inch	5 9 feet	51 feet.
No. 3	2-20 inch	550 feet	80 feet.
No. 4	4-20 inch	490 feet	140 feet.
No. 5	8-20 inch	440 feet	190 feet.
No. 6	12-20 inch	400 feet	230 feet.
No. 7	16-20 inch	350 feet	280 feet.

THERE is great excitement in Hungary over the result of the trial of the Jews accused of murdering Esther Solyman. At Presburg a mob of anti-Semitics gathered, and became so hostile in their demonstrations against the Jews that the authorities were compelled to order out the military to disperse them.

Mineral Products of the United States.

A report entitled "The Mineral Resources of the United States" is now in press, and will shortly be published by Mr. Albert Williams, Jr., Chief of the Division of Mining Statistics and Technology, United States Geological Survey, Hon. J. W. Powell, Director. This report is for the calendar year 1882, and the first six months of 1883. It contains detailed statistics for these periods, and also for preceding years, together with much technical and descriptive matter. The compilation of special statistics has been placed by Mr. Williams in the charge of leading authorities in the several branches, and the results will therefore be accepted with confidence. The following totals of production are compiled from advance sheets:

It is impossible to state the total mineral product in any form which shall not be open to just criticism. It is evident that the production statistics of such incongruous substances as iron ore; metallic gold and silver; the spot value of coal mined and the market value of metallic copper after having been transported hundreds of miles; the spot value of a crude substance like underground, unrefined barytes, and the value of a finished product like brick (in which the cost of manufacture is the leading item), such details cannot well be taken as items in a general summary. The statistics have been compiled with a view to giving information on those points which are of most interest and utility, and are presented in the form usual in the several branches of trade statistics. The result is that the values stated for the different products are necessarily taken at different stages of production or transportation, etc. Theoretically, perfect statistics of mineral products would include first of all the actual net spot value of each substance in its crudest form, as taken from the earth; and yet for practical purposes such statistics would have little interest other than the fact that the items could be combined in a grand total in which each substance should be rated on a fairly even basis. The following groupings, therefore, are presented with a full realization of the incongruity of many of the items:

VALUES OF THE METALLIC PRODUCTS OF THE UNITED STATES IN 1882.

Pig iron, spot value	$106,336,429
Silver, coining value	46,800,000
Gold, coining value	32,500,000
Copper, value at New York City	16,038,091
Lead, value at New York City	12,624,550
Zinc, value at New York City	3,646,620
Quicksilver, value at San Francisco	1,487,537
Nickel, value at Philadelphia	309,777
Antimony, value at San Francisco	12,000
Platinum, value at New York City	1,000
Total	$219,756,004

VALUES OF SOME OF THE NON-METALLIC PRODUCTS OF THE UNITED STATES IN 1882 (ALL SPOT VALUES, EXCEPT CHROME IRON ORE.)

Bituminous coal, brown coal, lignite, and anthracite mined outside of Pennsylvania	$76,076,487
Pennsylvania anthracite	70,556,094
Crude petroleum	23,704,698
Lime	21,700,000
Building stone	21,000,000
Salt	4,320,140
Cement	3,672,750
Limestone for iron flux	2,310,000
Phosphate rock	1,147,830
New Jersey marls	540,000
Crude borax	338,903
Mica	250,000
Crude barytes	160,000
Chrome iron ore, value at Baltimore	100,000
Soapstone	90,000
Manganese ore	52,500
Asbestus	36,000
Graphite	34,000
Sulphur	21,000
Cobalt ore and matte	15,000
Precious stones, uncut	12,500
Asphaltum	10,500
Corundum	6,250
Punice-stone	1,750
Total	$226,156,402

RESUME OF THE VALUES OF THE METALLIC AND NON-METALLIC MINERAL SUBSTANCES PRODUCED IN THE UNITED STATES IN 1882.

Metals	$219,756,004
Mineral substances named in foregoing table	226,156,402
	445,912,406
Fire-clay, kaolin, potter's clay, common brick clay, terra cotta, limestone used as flux in copper and lead smelting, iron ore used as flux in lead smelting, pyrites (for acid making), zinc white made directly from ore, marls (other than New Jersey), apatite, gypsum, tin ore, bismuth, arsenic, iridosmine, mill buhrstone and stone for making grindstones, lithographic stone, talc (other than "soapstone"), quartz, feldspar, fluospar, terra alba, chalk, crude mineral paints, nitrate of soda, carbonate of soda, sulphate of soda, native alum, ozocerite, mineral soap, strontia, etc. certainly not less than	8,000,000
Grand total	$453,912,406

The grand total might be considerably reduced by substituting the value of the iron ore mined for that of the pig iron made; by deducting the discount on silver; and by considering lime, salt, cement, borax, etc., as manufactures. It will also be remarked that the spot values of copper, lead, zinc, and chrome iron ore are much less than their respective values after transportation to market.

Metallurgy and Ores.

Nevada Metallurgical Works,

No. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores Worked by any Process.

Ores Sampled,

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, Etc.

Working Tests (Practical) Made.

Plans and Specifications furnished for the most suitable process for working Ores.

Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO,
(Formerly Huhn & Luckhardt.)
Mining Engineers and Metallurgists

JOHN TAYLOR & CO.

IMPORTERS OF AND DEALERS IN

Assayers' Materials,

MINE and MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.

☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grams and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., Loudon, England.

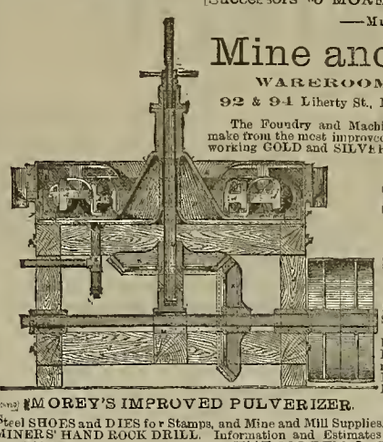
Established 1864.

THE MOREY & SPERRY MINING MACHINERY CO.,

[Successors to MOREY & SPERRY,]



—Manufacturers of all kinds of—

Mine and Mill Machinery

WAREROOMS: 92 & 94 Liberty St., New York.

WORKS: Newburg, - New York.

The Foundry and Machine Shop having been enlarged we are now prepared to make from the most improved patterns QUARTZ and STAMP MILLS complete, for working GOLD and SILVER ORES.

MOREY'S IMPROVED PULVERIZER.

MOREY'S IMPROVED PULVERIZER,

For WET or DRY Crushing.

SIMPLE, EFFICIENT and DURABLE

The Balls revolve **Horizontally** without friction, 5 ft. size, weight 7,000 lbs., and does more work than 15 Stamps, 3 ft. size, weigh 3,000 lbs.

Concentrating Mills, Rock Breakers, Amalgamating Pans and Separators, Roasting Furnaces, Hoisting and Pumping Machinery, Engines and Boilers, any size required, Hydraulic Giants and Pipe, Ore Cars, Ore Buckets, Safety Cages. The Hand Power Two-stamp Mill, weight 280 lbs. THE EUREKA WIRE ROPE TRAMWAYS, Concentrating Riffles for Mills and Hydraulic Sluices.

Agents for IMLAY ORE CONCENTRATOR and the MINERS' HAND ROCK DRILL. Information and Estimates cheerfully given. **Send for Catalogue.**

Address, THE MOREY & SPERRY MINING MACHINERY CO.

ANTI-SCALE COMPOUND

Manufactured by RICKARD & DURDEN.

We guarantee that, with proper use, this Compound will remove and prevent all

INCRUSTATION IN STEAM BOILERS.

Ten years trial, in widely separated localities, has demonstrated the value of this invention, and its applicability to different qualities of water. References cheerfully furnished to any one wishing same.

☞TEN POUND SAMPLE BOX FURNISHED FREE ON APPLICATION.☜

BERRY & PLACE MACHINE CO., Sole Agents,

No. 8 CALIFORNIA STREET, S. F.

READY FOR DELIVERY.

LATHES, DRILLING MACHINES, PLANING MACHINES

And Other Machine Tools.

STRONG, DURABLE AND SUPERIOR TO IMPORTED MACHINES.

Wheel Cutting to Order.

SAN FRANCISCO TOOL CO., - - 21 Stevenson St., S. F.

Mining Engineers.

LUTHER WAGONER, C. E., M. E.
JOHN HAYS HAMMOND, M. E.

Wagoner & Hammond,

MINING ENGINEERS,

318 Pine St., San Francisco, and
Alamos, Sonora, Mexico.

Special attention to the designing and construction of Concentration Works for all ores. Gradual reduction by rolling impact, classification by air currents, improved pointed boxes and corrugated rubber and iron Rittinger tables.

☞Correspondence and samples solicited from parties having low-grade properties.

MINES REPORTED UPON.

GEORGE MADEIRA,

Geologist and Mining Engineer.

Reports on mines furnished; Estimates of Machinery etc. Special attention paid to the examination of mines in Mexico, California, Arizona and New Mexico. Thirty years in the mines of the above States.

THE ROLLER ORE FEEDER.

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

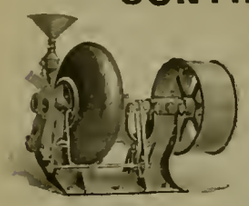
Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.



HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Olant and Old Abe Co., Black Hill also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanica in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

California Machinery Abroad.

We have always sent more or less of our California machinery to Australia, the Pacific islands and to Mexico, particularly the latter place. The mining machinery made here has a world-wide reputation, and large quantities of it have been sent to Mexico, as well as some to Central America. We have had so many years of experience here in mining aud metallurgical appliances, that others desire to benefit by it, aud come here to purchase. A fresh instance is worthy of record.

For many years the copper production of Chili has been from seventy per cent to seventy-five per cent of the world's production. In consequence of a falling off in the grade of the ores, as well as competition from Spain and the United States, the output has been gradually diminishing during the past few years. Up to this time only the slow and crude process of reverherating aud stone-blast furnaces have heen used, which, even in a country of cheap lahor, cannot stand the competition of improved mechanical appliances. Waking up to the necessity of adopting the latest American improvements, which have stimulated production so largely in this country for the past few years, a representative of some of the principal mines in Chili recently visited this city for the purpose of familiarizing himself with the improvements referred to. After a thorough investigatiou of the whole matter, an order was placed for one of the famous Pacific copper smelters of Rankin, Brayton & Co., of Sau Fraucisco, with the assurance that if such results are obtained there as are universally given in this country, they will adopt them for their whole system of mining.

The gentleman referred to expressed great astonishment at the facts suhmitted in regard to the cost of haudling ores with this smelter, and admitted that for the effective and ecouomical treatment of all classes of copper ores, no other process in the world could compare with it. This evidence of the appreciation of an American invention, coming from a people slow to adopt new ideas, especially foreign ones, is a marked instauce of the progressive character of that people, as well as another gratifying assurance of the admitted superiority of Pacific coast mining machinery.

JAMES S. WATERMAN, who died recently in Chicago, was the founder of the town of Sycamore, Illinois, and its wealthiest citizen. With his brother, R. W. Waterman, of the Hot Springs, near San Bernardino, he owned one of the very richest of mines on the Mojave Desert, near Calico district. With his wife, Mr. W. recently spent several winters in southern California, forming warm attachments among the good citizens of San Bernardino and Riverside, who sincerely sympathize with Mrs. Waterman, and other relatives of the deceased.

A Confident Subscriber.

[From Pacific Rural Press, 8 F.]

Rufus Fiske, of Santa Clara county, who shows his faith in the RURAL PRESS by paying his subscription two years in advance, writes as follows:

"Your paper has become such a valuable aid to me in my business of farming that I cannot afford to be without it. Not only every farmer ought to have it, but all who are interested in the welfare and development of the State. Success to you in the future as well as in the past."

INFORMATION is wanted at this office of one Joseph Craig, formerly of Cass county, Illinois, who came to California in 1849.

A Slander on the Northwest.

The following paragraph was inadvertently published last week:

A GOOD COUNTRY FOR THE DOCTORS AND UNDERTAKERS.—The following is clipped from an exchange, and will prove interesting to persons who intend leaving for the Northwestern country: "The undertaking business flourishes at Portland and elsewhere throughout Oregon. What with malaria, quinine and whisky, and the debilitating effects of a long journey in steerage and emigrant car, Death's sickle reaps a large harvest, the children especially dropping off like rotten sheep. But still the Northwest is filling up, and everbody is confident about the grand time coming."

We are perfectly sure that this is a great slander upon the State named, and the only object in publishing it should be to denounce it and warn all readers that it is not worthy of credence. No doubt the journey undertaken by emigrants is often a hard one, and a severe test to those in delicate health and to children, but the idea that the mortality is great among them is wholly false. Most of them are strengthened and invigorated by a change of scene and air, and many who are not strong at starting become vigorous by the journey. The inference that Oregon is an unhealthy State is an unwarranted one. There is sickness there, of course, as there is everywhere, which is owing to various causes, but the climate of the State is salubrious and desirable. The Northwest is filling up, it is true, and the people are confident of its future, as they have reason to be. Those who are disposed to take part in the development of its rich resources should not be misled by false reports which bear upon their face the stamp of exaggeration and falsehood.

SACKETT SCHOOL.—This well known and popular school at Oakland, has opened the new year of work with an enlarged corps of instructors and a gratifying increase in students. The aim of the school has always been to do thoroughly the work that is attempted. None but the best of instruction is furnished, and the hours of recitation have this year been lengthened in order to give more attention to each student. We are glad that such wise and liberal provisions are meeting a just and worthy response at the hands of discriminating parents who have sons to educate away from the home roof. We heartily commend all such, with personal knowledge of what we say to the Sackett school.—*California Rescue.*

OUR EXPORT TRADE.—The *Grocer* remarks that while the growth of the State in some directions during the past ten years has not been so rapid as might be desired in one department at least, that of foreign exports, an extraordinary increase has occurred. Statistics compiled at the Custom House in this city show that the total value of these exports increased from $20,310,722 for the fiscal year ending June 30, 1874, to $44,143,363 during the last fiscal year, an increase of $23,832,641.

NOTHING builds up shattered constitutions so quickly as Brown's Iron Bitters.

Successful Patent Solicitors.

As Dewey & Co. have heen in the patent soliciting business on this coast now for so many years, the firm' name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific coast patents issued by the Government have heen procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That is this understood and appreciated is evidenced by the uumber of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Arizona Territory
M. H. JOSEPH—Eureka, Nev.
I. M. LEHY—Los Angeles, San Bernardino and San Diego counties.
A. C. KNOX—Oregon and Washington Ter.
J. J. BARTELL—Yolo county.
E. P. BILLINGS—San Luis Obispo Co.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

News in Brief.

THE Texas fever has broken out at Dodge city, and cattle are dying off in great numbers.

Two Indians have been hanged for the murder of two white men at the Harrisburg mines, in Alaska.

THE Canadian Pacific managers state that 2,000,000 bushels of wheat will be sent to tide water this season from Manitoba.

THE Lexington Mining Co., of Butte, Montana, paid its first dividend of $220,000 on the 1st of July, in Paris, where the owners chiefly reside.

THE Silver Buttes mine produced $21,700 in July, with an expense of $14,272. The Plumas Eureka produced $38,975, with an expense of $22,095.

JOHN C. NEW, Assistsnt Secretary of the Treasury, is said to have been finally converted to the idea of abandoning the coinage of standard dollars.

THE delay in the completion of the Brooklyn bridge cable line is caused by the necessity of waiting for an expert cable splicer from San Francisco.

FRANK LESLIE, a government scout, informs the Tombstone *Epitaph* that several small bands of Chiracahuas are on their way to the San Carlos reservation.

A CHARTER for the St. Louis, California and Denver railway has heen filed at Topeka. The railroad is to be 1,000 miles long. The capital stock is $30,000,000.

GOV. STONEMAN has appointed Mat. F. Johnson, of Sacramento, to the position of Trustee of the State Library, to fill the vacancy caused by the death of W. W. Crane.

THE Merced *Star* says: It is an assured fact that thirty miles of the Turlock and Sierra Nevada railroad will be in complete running order by the first of January, 1884.

BOWEL complaint, diphtheria, fever and other styles of sickness are among the Piutes in the vicinity of Austin, Nev., and the Inians are losing quite a number, especially children, by deatb.

A GANG of Chinamen resisted the collection of the poll tax in Josephine county, Or., Saturday, and 150 of them charged the officers and posse, who fired upon the Chinese, killing three and dangerously wounding the same number.

A MAN named Barker Ewing, on Hurricane creek, in the center of Arkansas, killed his daughter upon the announcement of her intention to marry a certain young man against his wishes. The neighbors then hanged Barker in his front door-yard.

THE FISH INDUSTRY.—Prof. Huxley, in an address at the International Fisheries Exhibition, pointed out that an acre of good fishing ground will yield more food in a week than an acre of the best land will yield in a year. Still more striking was his picture of the moving "mountain of cod," 120 to 130 feet in height, which for two months in every year moves westward past the Norwegian coast. Every square mile of this collosal column of fish contains 120,000,000, consuming every week, when on short rations, no fewer than 840,000,000 berrings. The whole catch of the Norwegian fisheries never exceeds in a year more than half a square mile of this "cod mountain," and one week's supply of herring are needed to keep that area of cod from starving.

PUNY, weak, and sickly children are made healthy and strong by using Brown's Iron Bitters.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Stock and Grain Land

Parties wishing to purchase good stock raising lands, unaffected by severe drouths, will do well to address the undersigned. The lands can he purchased cheap, in lots from 100 to 2,000 acres. It is partly low table and rolling land, partly clear and level. Good for vine and fruit raising. Will raise vegetables and all kinds of grain. Crops certain every year. Near town and a $10,000 public school house. Price, $3 to $5 per acre. Good local market for fruit, vegetables, grain, poultry and dairy produce. Address the proprictor,

EDWARD FRISBIE,
Anderson, Shasta Co., Cal.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will he sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can he had upon applying o thie office.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

TRUE Temperance

Is not signing a pledge or taking a solemn oath that cannot be kept, because of the non-removal of the cause—liquor. The way to make a man temperate is to kill the desire for those dreadful artificial stimulants that carry so many bright intellects to premature graves, and desolation, strife and unhappiness into so many families.

It is a fact! BROWN'S IRON BITTERS, a true non-alcoholic tonic, made in Baltimore, Md., by the Brown Chemical Company, who are old druggists and in every particular reliable, will, by removing the craving appetite of the drunkard, and by curing the nervousness, weakness, and general ill health resulting from intemperance, do more to promote temperance, in the strictest sense than any other means now known.

It is a well authenticated fact that many medicines, especially 'bitters,' are nothing but cheap whiskey vilely concocted for use in local option countries. Such is not the case with BROWN'S IRON BITTERS. It is a medicine, a cure for weakness and decay in the nervous, muscular, and digestive organs of the body, producing good, rich blood, health and strength. Try one bottle. Price $1.00.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

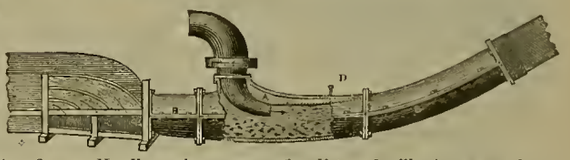
That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such a machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,



Room 7, 109 California Street, - - - SAN FRANCISCO, CAL

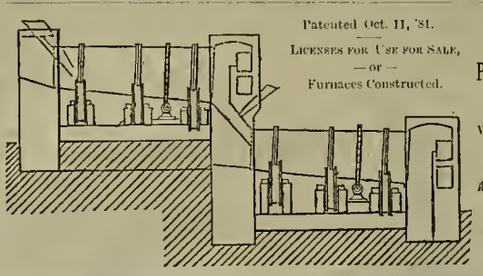
Nov. 6, 1882.

HYDRAULIC GRAVEL ELEVATORS.

The Great Problem of Shallow Hydraulic Mining Solved.

NEW FIELDS OF ENTERPRISE IN HYDRAULIC MINING OPENED UP.

These machines are thoroughly effective for working flat gravel mines that have no dump. Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.



No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon.

At the property of the Yreka Creek Gold Mining Company, in Siskiyou county, Cal., an Elevator of the Improved Form has been introduced, which, with a head or pressure of water of 266 feet, is elevating through an 18-inch machine to a vertical hight of 46 feet from bedrock to upper flume.

☞ Descriptive Catalogues and prices furnished on application to the undersigned, who are the sole manufacturers of these machines.

EXCELSIOR BLASTING POWDER,

Menufactured by the

EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro-Glycerine Powder, as safe to use and handle as any other Nitro-Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

EXCELSIOR POWDER COMPANY,

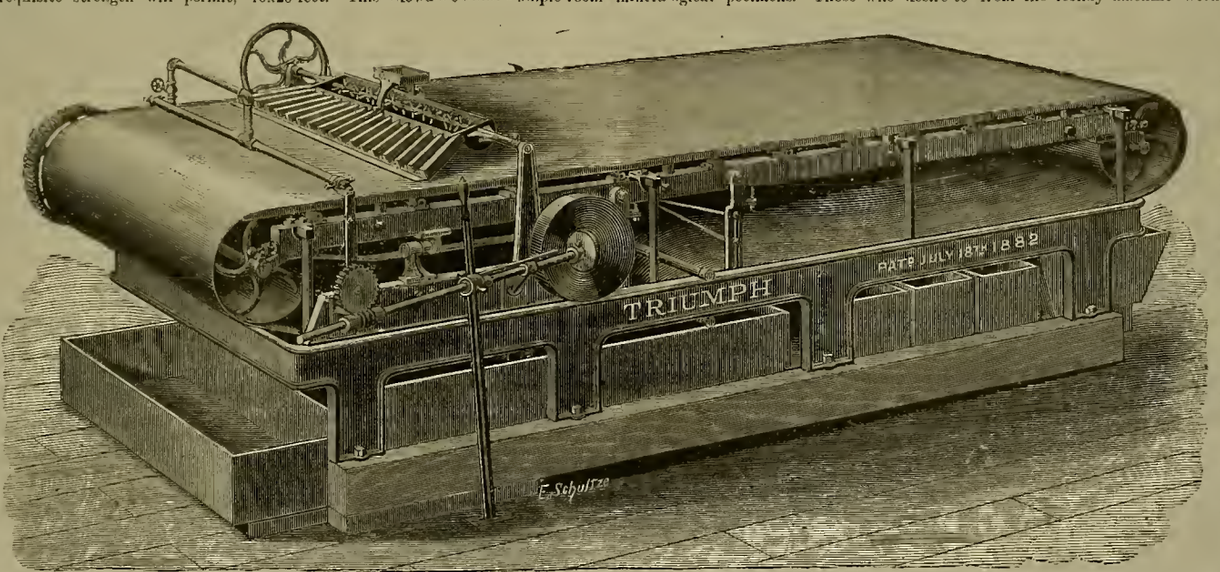
Room 9, No. 3 California St., - San Francisco, Cal.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, AUGUST 18, 1883.



VOLUME XLVII Number 7.

The Triumph Concentrator.

The engraving on this page illustrates an endless belt concentrator invented last year, and which has been gradually improved as experience dictated. The Joshua Hendy Machine works in this city are now the manufacturers, and numerous small details have lately been perfected in the construction of the machine, all to its benefit. It is, therefore, somewhat different from what it was when exhibited at the Mechanics' Institute fair of last year, where it received the medal for the best wet concentrator on exhibition.

The advantages claimed as entering into the construction and operation of these machines are as follows;

That they are built in a superior manner; the entire frame being of iron ensures the solidity and durability of the machine, and a steadiness of movement when in operation; and being as compact as the requisite strength will permit, weigh less, require less freight space in boxes, by which the cost of transportation is decreased, and occupy less mill-room when set up.

TRIUMPH ORE CONCENTRATOR.

The endless belt is carried upon a supplementary frame, which is mounted upon peculiar springs. Its operation tends to quietly settle the sulphurets on to the surface of the belt. Once on the belt, they will travel up while the gangue discharges below. This supplemetal spring frame quietly settles the sulphurets without a too sudden jar or bump.

The reciprocating movement which is given to the supplementary frame and endless belt, in combination with a slight percussion, tends to settle and retain the sulphurets upon the belt until they are discharged at the proper moment. This peculiar motion is of the utmost importance, and enables the machine to perform a very large amount of work.

Patent self-oiling boxes have been put in for main journals and eccentrics.

The rolls supporting the belt are made of galvanized metal, which neither warp, crack nor rust—that is, the inner part is fine selected redwood, covered with zinc soldered at the ends, which practically seals up the wood so it will not warp. The feeding mechanism permits the travel of the belt to be varied at will to any desired speed.

The belts are of best quality of rubber, and durable. An improved form has been adopted. The edges are so formed that as the belt passes over the rolls at each end the edges curl up. By the new form the beveled guides on the frame are dispensed with, thus getting rid of the friction which formerly occurred.

The arrangement for saving amalgam that may escape the batteries is novel. They have a peculiar covered amalgamating box across the head of the machine with a recess for quicksilver. Back of this are riffles, as a supplemental precaution against loss. We are told this amalgamator alone (without the concentrator) has recently caught $200 a week from the pulp of a ten-stamp mill.

Three of the machines are amply sufficient to take the delivery of and thoroughly concentrate the sulphurets and metallic particles from two batteries (10 stamps), six for a 20 and twelve for a 40-stamp mill, and are conveniently set in pairs for easily adjusting and operating. Power required for running machine, two five-horse power. Water required for cleaning sulphurets, 60 gallons per hour (exclusive of battery water delivering pulp). Space occupied when set up, 10x20 feet. This allowance affords ample room between the machines and at the ends for drawing sulphurets. Weight of machine, 1,600 lbs. The heaviest part weighs 80 lbs.

The machine is now being built with a care to detail so it will practically need little attention at the mill, and so that any unskilled person can attend it. Two Triumph concentrators are used in the Gold Blossom mine, near Newcastle, Placer county, in this State, giving satisfaction. Two have also been sent to the Chicago mine at Penryn, same county. There are three on the Compromise mine, Mariposa county.

Two are being put up for the Gonzales Mining and Development company at Hornitos. The best results have been at Newcastle, where two machines are taking the pulp from 10 stamps, which are crushing twenty-five tons per day. One of these machines can be seen in operation at the Joshua Hendy Machine works, 49 and 51 Fremont street. The manufacturers state that they guarantee all purchasers as to the validity of their patents, and that they are building a practical machine that they can recommend to the mining community.

The State Mineral Exposition.

The State Mineral Exposition was formally opened at the State Mining Bureau, 212 Sutter street, on Wednesday of this week. We have before referred somewhat at length to the proposed display. In addition to the collections belonging to the State, a number of counties have contributed cases of minerals. There are also several private collections. That of J. Z. Davis is a very fine one. Owing to lack of means, Mr. Hanks has not been able to carry out his original plan fully, but he has nevertheless succeeded in getting up a very creditable display. A number of additional cases have been put in the museum, and an entire re-arrangement of the specimens has been made. The Mining Bureau will well repay a visit even from those persons not interested in minerals, for there are many rare and interesting things to see aside from the geological and mineralogical specimens. Those who desire to witness an illustration of a part of the resources of the coast can do so by calling at the Mining Bureau. We shall have more to say of the display hereafter.

At a recent visit of the agent and secretary of the Cleveland (England) Miners Association to a mine they were shown an experiment with bronze and copper stemmers. An emery-wheel was set in motion, and was made to revolve 1,200 times per minute. A new phospor bronze stemmer was pressed to the wheel for about one minute, but no sparks could be seen. A new copper stemmer was then tried; no sparks were visible, and then an old copper stemmer was applied with the same result. The miners' representatives some time ago asked the Cleveland mine owners to use phospor bronze instead of composition or copper gear for charging holes.

The big tunnel at the Ontario mine will soon be completed. It was commenced in 1881, but the progress for the first year was very slow. Its length is 5,742 feet, nearly all the way through hard rock.

Foundry Notes.

Business is rather slack at the foundries just now, though some of them have considerable work on hand.

The Risdon Iron works are at work on a large pumping outfit on the hydraulic principle which has worked so well at the Combination shaft and elsewhere.

The San Francisco Tool works are moving into their new and fine brick building adjoining their former quarters on Stevenson street. The new premises are arranged specially for these works, and are exceedingly neat and convenient.

It will be remembered that when the Cranston hydraulic elevator was first devised, many intelligent persons said it would not work. It has worked, however, very satisfactorily, not only here but abroad. Last week an eighteen-inch elevator and No. 2 water-lifter were shipped from the Hendy machine works to the Kin-Mori mines, near Gainesville, Georgia, a somewhat famous gold district. It will be used to work out some of the shallow washings before reaching up into the quartz above, which is hydrauliced. They have some 300 acres which they are going to work by the elevator.

Some considerable correspondence was carried on with Col. Latham Anderson, of Anderson & Hobby, mining engineers of Cincinnati, in reference to the elevator, and finally he concluded to come to California and see the machine at work. After arriving in San Francisco he went up to Cherokee, where there is one of the most improved form, and the best ever built, at work. He was so much pleased with what he saw of its operation that he gave the order referred to.

The manufacturers are also in correspondence with a gentleman in New York relative to making one of these gravel elevators for use in North Carolina. This is another instance of the utilization of California machinery by other communities.

At the Whitehaven collieries, England, where they have been mining since 1667, they have a pumping engine which has been at work since 1806. It is one of Newcomen's atmospherics, and is constantly in use, and still in first rate order, after working about seventy-nine years, being about the only one of the class extant.

The Calico *Print* says about thirty tons were taken out lately from the Blackfoot mine, which is reported to go $4,000 to the ton.

The Carson Footprints.

The following paper on the Carson footprints was read before the California Academy of Sciences at the meeting last Monday evening, August 6th:

One year since I read before this Academy a paper relating to the now famous footprints at Carson. The motive which has induced me to prepare another paper upon the some subject is, that I may be able to explain more in detail many facts—then simply referred to—which are now likely to become of the most importance in determining the many vexing questions which are constantly arising in relation to these interesting remains. A desire to render myself clear must serve as my excuse for the repetition of a few extracts from my former paper.

Within the past year the quarrymen have laid bare a number of new tracks and a few fragments of the bones of animals. These recently discovered footmarks were all upon the lower level of the quarry, and are all of the same character as those which had previously been exposed. Of fossils there have been found during the past year a portion of the jaw of an animal not yet fully identified, a tooth of the horse and many fragments of the bones of animals. These bones have been carefully preserved, and it is to be hoped that they may be of value in the future, when a careful study shall be made of them. While these bones may prove of very great interest, yet they attract but slight attention when compared with the foorprints which are found upon the floor of the quarry beneath them. These prints continue to excite the liveliest interest not only among the scientists of America and Europe, but also amongst the people at large.

Of Bipedal Origin.

While some express the belief that the tracks are those of a quadruped—Prof. Marsh, even before so august a body as the National Academy, ventures to give name to the animal who made them—there are others, including the writer, who are equally sanguine in the belief that the footprints in dispute are of bipedal origin.

The question is gradually being brought within narrower limits, and it is likely that in the future the principal point for discussion will be, whether the tracks are those of a quadruped or those of a man, as it would appear that if it were once satisfactorily determined that they are surely the imprints of a biped, it will prove but an easy task to show conclusively that they were made by the progenitors of the human race.

I am fully aware that there are likely to be many delicate points which must yet be adjusted before the scientist will give full credence to so momentous a conclusion.

It is of importance that the exact geological period should be determined, so that other remains of man of that period—if any such should exist—such as flints or other implements, may be grouped together, and their relations, the one with the other, definitely determined. When this work shall have been completed, we may be sure that the Nevada man will take the position to which he is entitled.

Foot-Pads or Cushions.

All animals which walk upon the earth's surface are provided with certain pads or cushions which serve the double purpose of protecting the foot while in contact with the earth, and also by their elasticity facilitating motion. These pads or cushions vary greatly in form and density in the different animals so as to meet the requirements of the individual to which they may belong, so that these pads may often serve as important aids in the determination of species.

If, by way of illustration, we examine the foot of the ordinary barn-yard fowl, it will be seen that the bones are protected by these pads, and this is especially the ease where any articulation is in the least exposed to pressure.

Among the higher animals we find essentially the same conditions existing; in some instances the cusion is modified (as in the frog of the horse) so as to meet its requirements.

With the dog these pads are of such elasticity as to greatly facilitate his movement when running, while in the elephant locomotion is only possible owing to the heavy pads which protect the bones of his foot from harm. In man these pads are conspicuous wherever there is an exposed articulatian, and they are found to be of uncommon prominence and density amongst savage tribes who don't protect the foot.

In the investigation of the subject before the Academy this evening, where so much depends upon correctly interpreting the imprint of the foot upon the surface of the earth, we are compelled to note every minute trace which can be of service to us in our work; hence it will be seen that it is of the utmost importance that we not only make note of the shape and general outline, but that we also note every indication of the presence of any protection to the foot, be it either natural or artificial.

For this reason I have brought forward evidence to show that the pad is a necessity to all animals who walk upon the earth, and that their impression being absent in any footprint may well excite suspicion that the foot was artificially masked. Upon a close examination of the many tracks of birds at the prison, not only is the distinct form of the footprint preserved, but also the imprint of the pad as well.

Comparison with Other Tracks.

The impression of the foot of the dog is also most clearly defined, not only showing the pads and toes, but the imprint of the toe nail may also be distingisbed.

The track of the deer is as clearly defined and as sharply cut as though it were made but yesterday, even showing that one of his toes had been worn away so as to become shorter than its fellow, which is a deformity very common amongst mature individuals of the deer family of the present period.

On examining the impressions made by the elephant, we find that those of his tracks which have not been disturbed are clear and distinct, while certain irregularities in outline furnish proof, if proof were needed, that the impressions are those of a quadruped.

Description of the Track.

I now call your attention to far the most important prints to be found in that locality, viz: the tracks made, as the writer believes, *Homo Neradensis*.

These are about 400 in number, and belong to seven or eight distinct series, made, apparently, by as many different individuals. In length these prints are from fourteen to twenty inches, with a breadth of eight. The length of step is from three feet two to three feet three inches. The width of trackway (straddle) is eighteen inches, while the step is no longer than that of a man of the average stature. Here, it must be admitted, the trackway is of abnormal width. Of this, however, I shall speak presently.

As stated in my previous paper, in outline these impressions follow closely the shape of the human foot. From the toe outward the line is gradually drawn in toward the heel, while from the toe inward there is a graceful curve to the instep, and from thence in an outward direction to the heel. In one series of tracks this curve is much sharper than in any of the others. After repeated and careful observation I have failed to discover in any one of the 400 tracks the slightest indication of the imprint of pad or toe, of instep, of claw or of heel.

The absence of such marks becomes the more significant when we take into consideration the fact they are surrounded and actually crossed by tracks of other animals, which are so easily identified by their tracks alone.

Evidence of Sandals.

In each one of the footprints we find evidence, as I believe, that the foot had been protected by some artificial means; in some cases this was made of wood, as it would seem, or some other material equally unyielding, as the imprint is that of a plane.

In one or two of the series a depression along the central line of the track would indicate that in this case the individual had used a material more yielding than wood, such as the dried skin of an animal, which, becoming moistened, was bent upward at the sides.

The line of prints designated in Mr. Gibbs' plan of the locality as No. 1, is by far the most important of any which have as yet been discovered. It is here that we find impressions which are the most distinct. When I first visited the locality I obtained casts in plaster of several of those, which were subsequently engraved, and accompanied my first report. In order to render myself clear, I take the liberty to briefly refer to these diagrams:

In diagram No. 1, which is that of a left foot, we find that but a part of the impression made by the sole of the sandal is to be observed, which is included in a line of the average breadth of an inch or more, extending along the inner side of the foot, from a point near the heel to the toe; the toe of the sandal being shown for a distance of two inches from its extremity. In diagram No. 2, a right foot, the toe is still more distinctly shown, with indications of pressure upon the inside of the foot near the heel. In diagram No. 3 we not only find the toe of the sandal well shown, but a line indicating the pressure of the sandal from the toe backward nearly to the heel, this line being traced upon the outer side of the foot. Diagram No. 4 represents the imprint of the toe, and a line from the toe along the inside of the foot to a point near the heel.

As will be seen by these diagrams, the sandal was eight inches in width. We can easily imagine that the use of such unwieldly foot gear, especially when walking in muddy ground, would serve to account for the great width of trackway. Briefly reviewing the subject, there are many reasons which have led me to the conclusion that these

Imprints are not of Quadrupedal Origin.

Among the most important of the objections is: First—The entire absence of such destinctive marks as would indicate an unprotected foot. Secondly—There are no indications of a misstep, either by accident or at points where the animal has deviated from the straight line. Professor Marsh's statement that he is assured that a double trackway has been found, is certainly news to those who—unlike himself—have personally examined the tracks as they now appear upon the floor of the quarry. Third—The curve of the foot is so regular and so constant to show that in every instance the hind foot—if of a quadruped—was at all times placed exactly upon the spot previously occupied by the forward foot, or that both the forward and the hind feet were of exactly the same form—conditions which, to say the least, are extremely improbable. Fourth—We find, as before stated, that in one or two of the series (especially in that of N. 3 of Mr. Gibbs' plan) the central portion of the impression in the line of its long diameter, is somewhat more depressed than at the border, which is doubtless owing to the sole of the sandal having, when moistened by contact with the mud, yielded slightly to the pressure. This, as an isolated fact, becomes of great import, as it would indicate that if the tracks were of a quadruped, they were surely made by animals of different species. And finally, upon carefully studying the impressions upon the ground, we find that the angle of the foot varies in the several series, in some the curve being much sharper than in others; and while this fact may be easily accounted for upon the supposition that the form of the foot-gear varied according to the taste or the caprice of the wearer, yet it will doubtless prove to be a work of considerable difficulty to make this fact harmonize with the quadrupedal theory.

Lava Beds Mines.

Brief Description of the Principal Mines.

The reports that are constantly coming in from this new district, says the Calico *Print*, are very favorable, and convey the impression that the mines there are looking exceedingly well, and that there will be a large influx of miners and parties engaged in other branches of business to this new El Dorado as soon as the weather becomes cooler.

The principal developments in the district are being accomplished by the Morning Star mining company, consisting of Messrs. G. W. Grayson, of Oakland, J. H. Roberts and John McNally, of San Francisco. A few rods of openings have been made in one of their claims, the Meteor, but the company have concentrated their operations for the present on the Morning Star, which is beginning to twinkle with a bright and silvery luster in the midst of a constantly increasing galaxy of rich mines that will, in the course of time, place San Bernardino county at the head of the most prominent mineral-producing counties on the Pacific coast. There are twenty men at work in and about the Morning Star mine. The ledge on which this mine, also the Meteor, Mammoth, Chief, Sampson, and most of the principal locations of the districts are situated, runs in a northwesterly and southeasterly direction, the Meteor joining the Morning Star on the northwest. In a ravine at the southest end of this last mentioned mine is the camp of the company. Four or five hundred feet above the camp, near the croppings of the ledge, a blacksmith shop has been built. Several rods below it is a tunnel driven in about seventy feet in a northwesterly direction along the ledge, and connects with a winze sunk in the upper end of a thirty-foot cut, the winze being seventy feet deep. A track is laid in the tunnel over which the car carries the ore and waste rock to the respective dumps. A few rods northeast of the blacksmith shop is another cut about twenty feet in length, and about the same distance from the shop in a northerly direction is a shaft sunk about fifteen feet. Ore of a high grade has been taken out from all these openings. There are now twenty-five tons of ore on the dump that will average $200 a ton. A sack of average ore was sent to San Francisco as a sample that realized in silver eighty-five per cent of the assay test. The company feel encouraged that they have two valuable mines, and a few months' energetic operations will determine whether they have or not. It is the intention of this company to build a mill near the well in the dry lake as soon as they are satisfied they have permanent, paying mines. Judging from present developments, it will be a safe and remunerative investment to erect a mill there in a few months.

Last Wednesday when the foreman, Mr. John McNally, arrived at Daggett station he paid the remaining $10,000 due the Clark Bros. on the Morning Star and Meteor mines. The Clark Bros. are worthy of the snug little fortune they have realized from the sale of these mines. They still have some excellent mining property left.

As soon as the weather is cooler work will be commenced on the Sampson claim, recently bonded to Abe Bateman by S. P. Blade. For valuable services gratuitously rendered in prospecting this claim by James Parker, Mr. Bateman presented him with a gold watchand chain, and it is reported he will also be appointed foreman of the mine.

Mr. S. H. Baker sold his interest in the well located in the dry lake, and also his interest in the freigbting business to Messrs. E. A. McDuffee and J. S. Weaver, of Calico. The company, which now consists of these two gentlemen and Mr. Dan Guerne, are making arrangements to increase their facilities for hauling water and freight. Mr. McDuffee bought a span of fine horses from Mr. Van Briesen, of Daggett, to use in the business. In a few weeks they will have two four-horse teams engaged in hauling water to the mines and freight from the depot.

McDuffee & Weaver are erecting a building for a general merchandise store, and in a few days Mr. Weaver will go to San Francisco and lay in a large stock of goods. Mr. McDuffee will remove his tinshop into this building also, which will be in charge of Frank Lanyon.

Mr. Floyd, who resides eight miles from Los Angeles, owns a controlling interest in the Lizzie mine and intends to begin operations in a few weeks. Messrs. S. H. Baker and Dan Guerne each own an eighth interest in this mine. A tunnel has been run in fifty feet, from which sufficient ore has been taken out to justify them in opening up the mine in good shape.

Quite a number of prospectors have arrived in the district within the last few weeks.

Mines of San Diego County.

We have received from Mr. H. C. Burchard, Director of the Mint, advance sheets of his forthcoming report for 1882, relating to the production of the precious metals in California. We give the following extracts relating to the mines of San Diego county:

San Diego is the extreme southern county in the State of California, bordering on Lower California. The mining is done chiefly in the Julian, Pinacarte, Cargo Muchacho and Banner districts.

The Julian district, ten years ago, attracted attention far and wide. These mines have passed into the hands of Eastern capitalists, and, encountering a few discouragements, such as are incident to all mining ventures, have been allowed to languish; but recently new parties (old miners of experience) have taken hold of the mines, and they are being developed. The prospects are very flattering for obtaining good, productive property.

The San Jacinto mill, in the Pinacarte district, after a partial run of ten days, cleaned up $1,200. The mill is now doing good work, and crushing from twelve to fourteen tons per day. From the present outlook of the mine, it is anticipated that the mill will be turning out a large amount of bullion soon.

The Yuma Mill and Mining Co., at El Rio, is in a prosperous condition. The mill is steadily at work, and turning out a large quantity of bullion.

The Ready Relief mine and mill at Julian is in a prosperous condition at present. The yield of precious metals for the last six months has been largely in excess of any former period. The mine is looking promising.

The development of the Shenandoah mine, this side of Julian, has been pushed since Mr. Burchard's report was compiled. The indications in this mine are of the most flattering character, several thousand dollars worth of bullion having already been produced.

At Pinacarte the mines are all doing well; the poorest quartz and quartzite run from $30 to $40 per ton in gold. Three mills are crushing the quartz, one of them being a custom mill, which is of the greatest advantage to prospectors who own rich claims without the capital necessary to erect a mill. The California Southern railroad trains run within half a mile of the mines and mills. From all reliable information that can be gathered, Pinacarte is destined to become one of the richest mining districts in southern California.

Cargo Muchacho District.

This district was organized as early as 1862 as a mining district. The principal mine in this district is the Madre mine, which is a full claim of 1,500 feet, situated about three and a half miles from Ogilby station, on the Southern Pacific railroad. It lies in granite mountains, through which runs a reef or dike of talcose slate, the strike or direction of which is north, one degree east, and is about 200 feet wide, having a casing of slate on the west as a wall and of granite on the east. It is in the talcose dike that the Cargo Muchacho ledges are found. The claim covers three ledges. The one upon which the first shaft was sunk is the extreme west ledge. No. 2 is 170 feet deep, and levels have been run from the 50, 100 and 170-foot stations. The width of this ledge varies from one to five feet. From the foot of shaft B a crosscut was run east thirty-one feet into ledge No. 2. This ledge is parallel with the first, but is larger, and is the one upon which most of the work has been done. From where the crosscut struck the ledge a drift was started north along the vein, showing a body of ore averaging five feet in width. The drift was run 225 feet. This opens an ore-body 200 feet long and 200 feet high, which is the only supply of any quantity opened. The shaft has been carried down about 100 feet further, showing ore and a ledge at the bottom of eight feet in width, some stoping having been done on each side of the shaft.

The Madre and Padre mines are located parallel to each other, side by side. They are so similar to each other that a description of one will answer for both. They are also situated in a talcose dike, having an east wall of slate. The west wall is not well defined on the surface, but is supposed to be about one-half mile west of the Madre mine. They lie about one mile west of the Cargo Muchacho mine.

All the mines mentioned have good roads leading from them to the railroad station, over which ten mules of average size can haul two tons per trip, and make two trips per day. The absolute cost of hauling the ore from the mines to the station is forty-two cents per ton. The cost of mining and milling is very low. There is no water to contend with in the mines, timbering is slight and cheap, and wood is plenty at three dollars per cord. This is for four feet mesquite wood, which is equal to the best oak.

With a mill erected at the Cargo Muchacho mine, ore that will pay five dollars per ton can be worked at a fair profit, and there are several thousand tons stored in the mines now that will pay that much. The only reason for not putting the mill on the mines in the first place instead of on the river, was that water would have to be carried about seven miles from the river to the mines. This, however, can easily be done at a cost not exceeding $17,000. With a mill on the Cargo Muchacho mine, ore can be mined and milled at a cost not exceeding three dollars and twenty-five cents per ton.

MECHANICAL PROGRESS.

Steel Hardening.

Every one who has had any practice with steel hardening will have observed that articles so treated seldom remain exactly the same as they were before hardening. The experiments which for this reason have been made by different persons show that steel increases in size through the hardening; and if this fact be kept in mind, we have a clew to the deformations visible in certain classes of work; simultaneously we know what to do to avoid them. The first condition is, that steel should be of one uniform texture, for the better the quality the harder it will become; or, vice versa, the harder it becomes the more valued it is; and the harder it is made, the more will it increase in volume. Now, if a piece of steel is softer on the one side than on the other, the hardest side will expand more, and, as a consequence, this side will be convex, while the soft side will hollow, or be concave. This is plainly visible if steel be welded on iron, and the whole then hardened. To counteract the evils that we have just alluded to, various means have been devised.

Hardening in oil and fat has the advantage that steel intended for tool purposes requires excessive heating, whereby the texture of the material is deteriorated; for the more steel is heated before cooling, the more is its fibrous nature transformed into a crystallized state. If only fresh water of ordinary atmospheric temperature be used, and the steel merely heated to a cherry-red heat, a degree of hardness may be obtained which will be found sufficient for every purpose. In order to protect steel from losing its carbon, it is well to coat the articles to be hardened with a coating of train oil and soap, over which powdered horn-chips are strewn. Small articles may be covered with train oil and soap boiled together to a stiff paste, and subsequently placing them on a sheet of iron; they are next covered with powdered horn-chips. After being placed in the fire until no flame is visible from the horn-chips, they are next briskly immersed in water. The quicker the entire articles are thus immersed, the less will they become distorted, no matter whether the wide or the narrow side is first immersed. In place of using horn-chips by themselves, a mixture of horn-chips with a third of kitchen salt may be used. The latter gives a lighter color, whereas the soap in the forementioned mixture renders the articles handsomely white. When the hardened articles are cleaned lightly they are (whereby corrosion must be excluded) smeared with oil, and are allowed to oxidize according to the material to be worked therewith; *i. e.*, to a yellow cast for steel and to a brown color for brass; they are, however, not to be cooled any more in water, but slowly by the air. They thus receive greater elasticity. Articles which have become distorted under the hardening process may be again straightened during tempering by spanning them in a vise on to a somewhat concave piece of iron, and heating them afresh. When these articles become yellow, the vise is screwed up till the articles are straight, after it is cooled in such a manner that the convex side is first immersed in water. Small iron articles may be similarly hardened to small steel articles by first smearing them with the train oil and soap, and next placing them on a sheet of iron, strewing them over with a red or yellow prussiate of potash, instead of horn-chips. The articles become very hard, and feel rather greasy when they are taken out of the water.—*Mechanical Engineering.*

Utilizing Slag Waste.

Under this head an English paper states that there are now machines in operation in Great Britain that will turn out from 10,000 to 12,000 slag bricks per day. These bricks are described as being strong, perfectly uniform in size and requiring less mortar than ordinary bricks. The molten slag is run into molds direct from furnaces ranged round a rotary table, or by grinding the material and mixing it with sand, and then pressing. Both bricks and slabs are found well adapted for railway platforms, buildings of all kinds, baths, drainage pipes and roads, being more durable than ordinary stone. Besides dwelling upon the utilization of blast-furnace slag in the form of the well-known mineral wool, now so extensively used, the paper in question says that there appears to be no reason why slag should not be utilized for ornamental purposes, seeing that it is produced in nearly all colors, and the cost would be trifling. Slags from hematite ore, containing a certain proportion of manganese, give the tint of the amethyst in the vitreous parts, but by certain means that color is made to disappear and is replaced by a pearly white pumice one. Under different conditions the same furnaces give a slag of a dark green color. There are nearly all shades of blue and green, and there are light greens as well. An opalescent slag is usually found where there is a considerable quantity of alumina in the ore, while the ores of the coal measures give an alternation of shades, with dark green or blue stripes, sometimes running into one another, while an excess of lime gives a slag of a dull stony character. With protoxide of manganese, found in considerable quantities in spathic ores, in some instances to the extent of from 8 to 10 per cent, a violent color is produced, and yellow or dark green by proto-sulphide of manganese. A bright blue is met with in the Swedish slags, and looks well, and is attributed to various matters in the ores, probably sulphide of manganese. The colors of the slag, however, vary with their composition and the conditions under which the furnaces are worked, but the slags produced from furnaces with light burdens and making gray iron are usually white or gray. Where the burden, however, is heavy, and the temperature not so high, they are usually black, their vitreous character and fluidity increasing in proportion to the amount of silica in the ore. There is no difficulty found in getting the slag into a fluid state and casting it in molds. At present, however, the utilization of the slag, or blast furnace refuse, as it is generally termed, is principally confined to the making of bricks, slabs, slag sand, shingle for concrete, paving blocks, mortar, glass bottles, and the fine slag wool, or silicate cotton, for which there is now a large demand.

THE FIRST AMERICAN STEEL RAILS.—The first steel rails rolled in America were manufactured—not in Chicago, as commonly believed—but at the Wyandotte Rolling Mill, at Wyandotte, Mich., on May, 11, 1865. On May 24, 1865, steel rails were rolled at the North Chicago Rolling Mill, in Chicago, and as this was accomplished in the presence of a large number of members of the American Iron and Steel Association, which society then had a meeting at the Tremont hotel, in that city, that date and place became better known among iron and steel manufacturers. Several steel rails and an assortment of other shapes, plates, bars, etc., of the same material, bent and treated in the various ways to show its ductility, strength and homogeneity, were on exhibition in the vestibule of said hotel during the session of the society, and attracted great attention. The ingots for those rails, etc., were made at Wyandotte, Mich., by Ignatius Hahn, of Pittsburgh, who was there as superintendent of the Bessemer steel works, on May 4, 1865; produced at once serviceable ingots the second day thereafter (May 6th); got ingots heated, hammered and rolled out to rails of sixty pounds weight per yard, under his directions at the Wyandotte Rolling Mill on May 11th, and subsequently also at the North Chicago works on May 24 and 25, 1865.

METALLIC CLOTH. This novel invention, which has already been noted in these columns, is about to be commercially utilized on a considerable scale. This cloth, if desired, can be impressed with a pattern or printed upon. In the manufacture of this curious fabric the metal intended to be used is rendered into small particles, short or long, according to requirements, and in this form is mixed with a sticky material, such as india rubber. The mixture, as thus prepared, is transferred to goods made from cotton, wool, linen, silk or other textile, after which the fabric is dried and calendered, or dressed, in a suitable manner, so as to produce a smooth, metallic face. The process having thus been carried on to this extent, the cloth can be impressed with a desired pattern by the simple operation of embossing, or the pattern may be printed on its surface in the usual manner. The liquid charged with the metal does not penetrate to the under side, but leaves it quite clean. The finished material is quite soft to the touch and perfectly pliable.

MAGNETIC TOOL IN MECHANICAL INDUSTRY.—The method or principle by which a hollow coil of wire, or solenoid, sustains a heavy weight of soft iron in its center, provided a current of electricity is passing through the coil, and the current being cut off, the iron mass of coarse immediately dropping, has been carefully investigated of late by a French electrician, the result being the production of a hammer, possessing, it is said, some particular advantages. The tool consists of a solenoid about 3.28 feet long, composed of a series of flat coils placed one upon the other, forming a hollow cylinder, within which a second cylinder of soft iron, weighing about 55 pounds, is free to move. There are 80 of these flat coils, and these are connected with a battery in such a manner that a simple turn of a handle will direct the current into the solenoid, and the inclosed soft iron core may be correspondingly raised. The mechanism is so complete, it is said, that the blows of the hammer can be regulated to a nicety.

IMPERFECT DYNAMOS.—*Mechanics* says: Some mechanical engineers who have recently been investigating the operations of the electric light companies with a view to the introduction of electric light plants, have made most unfavorable criticisms upon the mechanical construction of some of the electric light machinery at present turned out. Their complaint is, that it is rough, carelessly made and poorly fitted, and that before a high efficiency can be attained by certain companies their methods of construction must be entirely remodeled, and the work done on the dynamos be as fine and accurate, to say the least, as that to be found on engines which are to run at a similar rate of speed.

USEFUL RULE.—Multiply the length of a sheet of boiler iron by .31831, and we have the diameter it will roll up to. This is convenient for boiler makers who, having a sheet of given length, wish to know what size cylinder it will make. No allowance is made in the above for lap. Observe the decimal point; that is, point off five figures on the right; the remainder is the diameter of the circle.

SCIENTIFIC PROGRESS.

Flowers and Insects.

In these days, after the very elaborate and ingenious demonstrations of the relations of flowers and insects, it is scarcely any longer doubted that the intimate economy of both has been modified and adapted directly with reference to the needs and habits of each; that the flowers have developed color, scent, and intricate devices of form to attract and to entrap the insects, in order that by their propitious visits they may be cross-fertilized, improved and more widely distributed; that on the other hand, the insects have become modified in shape and instincts to adapt themselves more commodiously to the various flowers, a process that has secured in nature a great variety of forms and habits among insects, and that these introactive influences are ceaselessly active.

Naturalists are inclined to think that the evolution of flowers, by which we now find three ways of fertilization created, viz: self-fertilization, wind fertilization (anemophily), insect fertilization (eutomophily), has followed exactly this last-mentioned order. That in earlier ages plants were all self-fertilized; that wind fertilized plants mark the next steps in advance, perhaps, and that insect fertilized plants developed their beauty of color and form last of all in the struggle for existence.

At this point Mr. Ed. Heckel, a French botanist, enters a protest, contending that colors of flowers have not been evolved with any reference to the perceptions of insects. And he instances the brilliancy of the Alpine flowers, where he maintains there are no insects, or too few to affect the results claimed by the evolutionists.

But recently M. Ch. Musset has spent four years of close observation in these altitudes, and affirms that insects are not absent or even rare at elevations of 7,000 feet above the level of the sea, and that the flower visitors, the Lepidoptera, Hymenoptera and Diptera, were more numerous than the other orders. Further, the *comparative* rarity of insects at high elevations is exactly calculated to produce a sharper competition among the flowers, and lead to the production of more brilliant and conspicuous tints. M. Heckel still insists upon the insufficiency of the cause assigned, and, of course, he may be right, but the presumption is against him at present. His own explanation seems at any rate deficient, being that "the solar radiations are more intense than in the plains."

This might, it seems natural to think, affect the colors of the insects as well as those of the flowers, but they are as a rule somber and dark. At any rate, the brilliant skies of Persia, Arabia and the Sahara have not produced a brilliant flora and fauna.—*Scientific American.*

A New Kind of Gunpowder.

Himly, in his efforts to discover a new kind of gunpowder that should possess more power than the ordinary powder, without the dangerous properties of the nitro-compounds like dynamite and that class, found that the best results were obtained with a mixture of saltpeter, chlorate of potash, and a solid hydro-carbon.

The new powder is made by mixing finely pulverized saltpeter, chlorate of potash, and coal-tar pitch with enough benzol (from coal tar) to make a plastic paste or dough. This is formed into flat cakes by pressing it into molds and the benzol allowed to evaporate. The cakes are then granulated like any other gunpowder. Like ordinary powder the grains are irregular, and can be made of any desired size. Its specific gravity is 0.9, or a little more, agreeing with common gunpowder.

It is quite hard, and does not smut off even when damp. It will bear a heat greater than that of melting tin without change. It will not ignite by a single spark of short duration. If ignited in an open vessel, it burns rapidly with a white light. In a closed space it burns violently, and leaves behind a slight residue, producing but little smoke. A gun is not injured in the least by the products of its combustion.

The advantages of this powder over those previously in use are essentially the following:

1. Ease and rapidity of manufacture.
2. There is no danger in making it.
3. Its freedom from any hygroscopic qualities; 100 grammes of it exposed to damp weather for four days in an open window showed no gain of weight with a delicate balance.
4. It is two and a half times more powerful than common powder.
5. The slight residue, leaving scarcely any thing.
6. The fact that it gives off so little smoke as to be scarcely noticed, and what is formed is totally innocuous as contrasted with that from nitro-explosives.—*Repert. Analyt. Chemie.*

PHOTOGRAPHIC POSITIVES PRODUCED DIRECTLY ON PAPER.—Cros. Vergeraud has utilized the properties of bichromates to produce positives directly on paper. He first saturates a suitable kind of paper with a solution of 2 parts of bichromate of ammonia and 15 of glucose in 100 parts of water, dries it, and exposes it under any positive (either a glass transparency, a drawing, tracing or other flat object). As soon as the exposed parts turn gray, it is immersed in a bath consisting of one part of nitrate of silver and 10 of acetic acid in 100 parts of water. The picture makes its appearance at once, and is of a blood red color (bichromate of silver). Wherever the light acts upon it, the glucose reduces the bichromate, but in those places which have been protected by the drawing, etc., the bichromate will be unchanged, and hence capable of forming chromate of silver, which is insoluble in water. If dried by the fire, the picture will remain red; but if exposed to the sunlight, it becomes dark brown. Sulphureted hydrogen, or a bath of potash and copper turns it black. *Comptes Rendus.*

A DIFFUSION ENGINE.—A curiosity in physics was exhibited by Mr. Woodward lately, at the Physical Society, London, in the shape of what is veritably a diffusion engine, that is to say, a machine in which work is done by the diffusion of gases. The action of the engine is based on an experiment of the late Professor Graham, the well known chemist. The experiment consists in taking a red clay porous cylinder containing air, and covering it with an inverted bell jar full of hydrogen. The hydrogen diffuses into the cylinder more quickly than the air diffuses out, as shown by means of a glass tube projecting from the bottom of the cylinder into a vessel of colored water. When the gaseous pressure inside the cylinder is increased by the influx of hydrogen, the mixed gases descend this tube and bubble out of the water. On removing the bell jar, the action ceases and a reaction, due to fall of pressure, causes the water to rise in the tube. By suspending the gaseous cylinder of porous clay from a balance beam, and directing a jet of hydrogen gas against its side, the beam begins to oscillate, and keeps plainly oscillating for a length of time; the action being sustained, as Prof. W. G. Adams, F. R. S., pointed out, by the alternations of gaseous pressure in the cylinder.

SENSE OF DIRECTION IN ANIMALS.—The remarkable faculty which cats, dogs, pigeons and other animals possess, of returning in a straight line to a point of departure, has awakened much curiosity on the part of naturalists. Some refer it to instinct, some to intelligence similar to that of man, some to an internal mechanism which makes the animals simply automata; but none of these attempted explanations does anything toward solving the mystery. Wallace supposes that when an animal is carried to a great distance in a basket, its flight makes it very attentive to the different odors which it encounters upon the way, and that the return of these odors, in inverse order, furnishes the needful guide. Toussenel supposes that birds recognize the north as the cold quarter, the south as the warm, the east (in France) as the dry, and the west as the moist. Recently Viguier has published, in the *Revue Philosophique*, an original memoir upon the sense of orientation and its organs, in which he attributes the faculty to a perception of magnetic currents.

INFLUENCE OF ELECTRICITY ON VEGETATION. Mr. Maeagno (*vide Les Mondes*) has experimented near Palermo upon the influence of atmospheric electricity on the growth of grape vines. Sixteen plants were submitted to the action of an electric current, by means of a copper wire inserted by a platinum point in the extremity of a fruit-bearing branch, while another wire connected the branch at its origin with the soil. The experiment lasted from April to September. The wood of the branches which were experimented upon was found to contain less potash and other mineral matters than the rest of the vine, but the leaves had an excess of potash in the form of bitartrate. The grapes collected from the electrized branches furnished more mast, contained more glucose, and were less acid.

EGYPT'S SCATTERED OBELISKS. Thirty obelisks transported from Egypt from time to time are now standing in various parts of Europe. Of these there are in Rome eleven, of which four are higher than the New York obelisk. The highest of these, and the highest in Europe, being 106 feet without the base, stands before the church of St. John Lateran. The obelisk in the piazza of St. Peter's is 82 feet 9 inches high. Both of these are mounted on high pedestals. The pedestal of the St. John Lateran obelisk is 44 feet high, making the entire height of obelisk and pedestal 150 feet. The pedestal of the St. Peter's obelisk is a trifle less than 50 feet high, making the whole height of the monument 132 feet 2 inches.

NICKEL CRUCIBLES.—M. Mermet recommends nickel crucibles instead of silver ones for use in chemical manipulations. Nickel is slightly attacked by melted potash, and so is silver itself. Nickel crucibles cost at first much less than those made of silver, and they have the great advantage of melting at a higher temperature. It often happens that inexperienced chemists melt their silver crucibles in heating them over a gas lamp; but such an accident is not to be feared in working with crucibles made of nickel.

VELOCITY OF RUNNING WATER.—A very slight declivity suffices to give the running motion to water. Three inches per mile in a smooth, straight channel gives a velocity of about three miles an hour. The Ganges, which gathers the water of the Himalaya mountains, the loftiest in the world, is, at 180 miles from its mouth, only 800 feet above the sea, and to fall these 800 feet in the long course of the river is said to require more than a month.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

ASSESSMENTS—STOCKS ON THE LISTS OF THE BOARDS.

Mining Share Market.

There is not much doing in stocks just at present, the market being dull. Up on the Comstock work is going on as usual, with no new developments of moment. At the Combination shaft they have begun cutting out a station for the new hydraulic pump, at a point a few feet below the 2620 level. This station will be 25 feet wide, 14 feet high, and about 100 feet long. The Chollar folks will do no more crosscutting on the 2600 level until the new pump is in operation, as they do not wish to take the risk of tapping a flow of water that would interfere with the cutting out of the new station and the putting in of the pump. At Gold Hill they are doing what they can in the way of mining; but, owing to the fact that the mills on the Carson river can reduce very little ore, on account of low water, the amount of ore extracted is small. The Yellow Jacket folks are taking out some ore yet, but the amount will probably be gradually lessened. Not much, except in the way of exploring and prospecting, can be done in the Gold Hill mines until the fall rains give a good head of water in the Carson river. At the Alta they are now putting boxes into the drain drift leading out to the Sutro tunnel on the 1030 level. Also, they are putting in a pump tank at the shaft at the same level. They will soon be ready to commence pumping from the lower levels.

STEAM SPACE.—The *Milling World* says: The steam space of a boiler should not figure up too small a ratio of the whole boiler, lest in a sudden demand for steam, part of the water should be drawn out and uncertain fluctuations of the steam pressure be caused.

THE Louisville Exposition is a failure in the matter of attendance. On the opening day it was about 15,000, but at no time since has it gone above 3,000.

THE product of the Salt Lake mines for the first half of 1883 is given at $4,500,000.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Alpine

HOPE VALLEY.—*Monitor*, Aug. 10: Raycraft and Williams, who have been prospecting for mines during the summer, report a good claim in Hope Valley on the mountain range north west of the Steven's ranch. They report a sixty foot ledge. Samples from the cropping assayed 30 per cent copper and 11 per cent silver.

Amador.

NOTES.—*Ledger*, Aug. 11: The clean-up of Morgan's rock at the Kelly mill turned out satisfactorily. The working expenses were all paid from the proceeds. There is no change in the situation at the Jackson mine. It was to have started up again last Monday. I. N. Dewitt started prospecting operations this week in the Dewitt tunnel, running through Murphy's ridge. The Amador Mining Co. have notices out, calling for proposals for the construction of 1,000 ft of tunnel at the Mammoth mine, Middle Bar.

DRYTOWN.—*Dispatch*, Aug. 11: The Phœnix reduction works discharged all their men last Tuesday and closed up for an indefinite period. Mr. J. L. Goodman is still prospecting on the eastern extension of the Quartz Mountain claim with good results. Hayward and Hobart were at the Hercules, Meiss and Jennings claims, and have made an offer for the property, intending to consolidate the three mines. The Potosi mill, which was working ore from the North California, has closed down for want of water. The clean-up averaged $4.50 per ton, which paid expenses. The Seaton Co. have their shaft on the "Home Stake," down 500 ft, and have struck good sulphurets, and the ledge continues to widen. The adjoining claim—the Loyal Lead—is yielding handsomely. It is rumored that the Gover Co. will resume operations.

Calaveras.

GLENCOE DISTRICT.—*Chronicle*, Aug. 11: Dr. J. A. Griswold, who recently bought the Eldred mine and located the Victoria, in Glencoe district, intends to put men at work on both, for the purpose of sinking them 100 ft deeper.

CHISPA.—We were shown a chispa that was taken out of the Bonanza Hydraulic, on Tunnel ridge, that weighed an ounce and a half.

SLUMGULLION.—Kennedy, McNorton & Co., are having the rock from the Slumgullion mine hauled to the Harris mill, in Sandy gulch, for crushing. The rock will average $30 per ton.

WEST POINT.—J. F. Richardson, of the Star of the West mine, took some of the rock to San Francisco. The rock assayed at three different offices as follows: $1,000, $1,700, and $1,400 per ton. The ledge continues widening. Mr. Richardson has employed more help and intends putting up a new mill.

NEW COMBINATION MINE.—*Chronicle*, Aug. 11: Work is progressing at the New Combination mine, owned by Emerson & Co., on the east side of Old Woman's gulch. The shaft has reached a depth of 75 ft, and it is expected that in a few feet the channel will be reached and gravel struck. The machinery erected for the purpose of freeing it of water works to a charm.

El Dorado.

GEORGIA SLIDE.—Georgetown *Gazette*, Aug. 11: The Pacific has been taking out some good pay during the past month, and we learn that the Beattie is coming to the front again, after more than a year of hard work and little pay. The Blue Rock is reported to be doing well.

MCGEE & KELLY.—During the past six months Mr. Potter has crushed 100 tons of quartz from this new mine, with good results. Mr. Potter will also have a crushing to do for the Baltimore mine, three-quarters of a mile distant. The quartz looks well.

EUREKA.—Supt. Baird, of the Eureka, has been disappointed by the long delay of the arrival of the machinist from the East who is to put up the pulverizer, but a telegram says he will arrive to-day.

Fresno.

FINE GOLD DISTRICT.—*Republican*, Aug. 11: From N. N. Smith, recently returned from the foothills, we learn the following concerning the mines of Fine Gold district. The Abbey mine, owned by Wm. Robertson and Jesse Morrow, had a cleanup last week of 10 tons of rock which yielded $600. They have 75 tons of rock on the dump that promises still better. Their steam arastras are at work with a capacity of three tons per day. Work on the Stockton, owned by Stockton & Gaily, is pushed rapidly. They are opening two ledges, the rock averaging $50 per ton. The Hildreth continues to improve as they sink. The last cleanup paid $80 per ton. The Williams is looking well. The Smith has been leased by Smith and Morrow, who are taking out ore. The last cleanup yielded $60 per ton.

Inyo.

POTOSI.—*Independent*, Aug. 11: During the past week a new body of ore was struck in the lateral drift southward from the original Potosi tunnel, Cerro Gordo, at a point 725 feet distant. The ore uncovered is a rich chloride. The body of ore lies at a most favorable point, being just under the "open cut" from which has been extracted during past years some $200,000. The hills are alive with prospectors.

Mendocino.

NORTH PACIFIC LIGHT.—Ukiah *Dispatch*, Aug. 10: Yesterday we were presented with a number of specimens of ore from the North Pacific Light mine, by J. C. Cox, the owner. The mines are seven miles west of Yorkville, in the neighborhood of where the Gualala, Garcia and Rancherie all head. Four tunnels have been run in, besides an open cut 300 feet in length. A great many assays have been made, and the results have shown from 12 to 60 per cent of copper, with traces of gold and silver.

Mono.

NOTES.—Homer *Index*, Aug. 11: The Virginia Creek Hydraulic Co. has no doubt struck the old Mono channel, which proved so rich in the long ago, having encountered a gravel bed running diagonally across. The new find prospects from one bit to $2.50 to the pan. J. R. Crane is pushing a drift in the ore vein of Neptune No. 2, on the ridge west of old Mono diggings. The drift is now in 30 ft, the face being ledge matter with three feet of solid ore.

The Kentuck mine, Sweetwater district, is employing 30 men, and the mine has plenty of good ore in sight.

The Gorilla mine and reduction works are being run steadily.

Paul Rouze is running the Hallahan arastra on ore from the Rocky Point and Gold Band mines, and it proves to be of high grade.

George W. Esh is running his arastra in Upper Lake canyon on very rich ore from the Golden Prince.

The Collamer mine, Lake canyon, is turning out some fine ore.

Very rich developments have been made in the Detroit copper mine.

James McDonald has begun work on the Bryant mine, Lake canyon.

Nevada.

QUEEN BEE.—The Queen Bee Co. have been driving their tunnel for the past month and have struck a good prospect in quartz. The Queen Bee ledge, a long time ago, produced some very rich quartz. West and Spencer have the control, and it is their intention to push the worked.

LIVE OAK.—The Live Oak Co. are working a ledge down in the vicinity of the Lime Kiln, and the encouragement is good.

POWNING.—The Powning Co. are sinking their shaft. It is supposed, that this is on the famous Eureka and Idaho ledge. The shaft is down 34 ft, and some of the pieces show free gold.

FROM THE RIDGE.—San Juan *Times*, Aug. 11: We made a trip to the Derbec mine on Sunday. Mr. DeNoon, the superintendent, was melting gold. He showed us two gold bricks, which were 6 inches long, 2½ inches thick and 3 inches wide. He was, when we left, making another of the same dimension.

SWEETLAND.—The Manzanita has cut down its force of men to 18 or 20. It is understood that no further washing will be done in this mine until the rains of winter fill the ditches. The dire results of the English dam outrage are making themselves severely felt. I am informed that from 125 to 200 men will be thrown out of work for want of water. As many of these men are the heads of families, the situation is a hard one.

SHERMAN.—Cor. *Transcript*, Aug. 10: There has been talk in relation to closing down of the works of the Sherman Con. Mining Co. The facts are these: A shaft was started months ago, and owing to the influx of water larger machinery was ordered, and everything has been running smoothly until within a few days. After getting the shaft down 140 feet it was found that the ledge was pitching in a different direction. The pumps will also be pulled up, but work will be resumed at no distant day.

THE IDAHO MINE.—Grass Valley *Tidings*, Aug. 12: Supt. Coleman informs us that the drift and backs in the 12-level are looking well, in fact the ore from this level is about as good as any that has ever come out of the mine.

EMPIRE.—The Empire is doing well; the rock is rich in specimens, and the general quality of the ore is more than average. The company is making arrangements for re-modeling the mill. The mill will be almost new when the work is finished. The Empire is the oldest worked mine in this district.

Placer.

GOLD BLOSSOM.—*Herald*, Aug. 11: Last Saturday, DuBois, Supt. of the Gold Blossom quartz mine, brought to town a gold brick, the product of a recent cleanup, that weighed 17½ pounds and was worth $4,000. Since this mine started last January it has run steadily. We understand that the size of the ledge holds out and the rock becomes more uniformly rich as they go down.

IOWA HILL.—*Argus*, Aug. 9: Prof. Blake, of the Providencia, is running a tunnel 200 feet with a view to develop the mine. If everything is favorable he will put up a mill. Mr. Weske has nearly completed an air shaft 300 feet in depth to afford the necessary ventilation. He expects to have fifty men at work. The main tunnel extends into the hill 1500 feet, and prospects are very good. Mr. Ossig has located a ledge near Grizzly Flat, which he says prospects well.

RATTLESNAKE BAR.—Mr. Bolcs is fitting up his river claim, preparatory to mining. He expects to have the pumps started in about four weeks. Mr. Zantgraf is running his quartz mill, and apparently with good results.

LITTLE YORK.—*Times*, Aug. 11: The mining season is about over, though the Little York mine is still running water and expects to continue working some time yet.

Plumas.

RICH GULCH.—Quincy *National*, Aug. 11: A. D. Hallsted and Frank Hill, from Rich gulch, tells us that on Saturday a very rich body of ore was encountered, better than anything yet found. They are making arrangements for the erection of a small mill. The ledge is extensive, the pay uniformly distributed through the quartz, and it is located so that great depth can be gained without large delay.

RIVERDALE MINE.—The machinery is all in place, and regular work on the shaft will be the order of the day from this time on. The machinery is strong and substantial, and the pump capable of handling twice as much water as will be encountered.

CLAREMONT PEAK.—The Claremont gravel is improving as depth is gained. Nearly 50 men are at work. Claremont peak will be a noted drift mine for many years to come.

San Bernardino.

THE KING MINE.—Calico *Print*, Aug. 11: We remember the "expert" Hammer, who published his opinion that the King mine would produce no ore below a depth of 200 ft. This year ore has been taken out 375 ft below the surface, and the quantity and average grade of the ore is gradually increasing. Last Monday, between the third and fourth level, a very rich strike was made in this mine. A vein of ore 2½ ft in width was uncovered that averaged from numerous samples taken from various points in the vein, $1,280 to the ton. These indications are that it extends to a considerable distance. The average returns of the ore taken to the mill have exceeded the average assays that were made quite often, and now reach $103 to the ton. It was intended to turn out $50,000 worth of bullion last month, but instead

about $60,000 worth were produced. There are several thousand tons of second and third-grade ore on the dump that will go from $25 to $50 to the ton, and average about $30 to the ton.

Shasta

WHISKYTOWN.—Cor. *Courier*, Aug. 11: I. W. Zent has put a force of men on the Red Rover, a mine which he has recently purchased. A Burleigh drill will soon be set at work in the Mad Ox mine. I have visited the Banghart mine. I was shown some very fine specimens. Habich & Bell have suspended work on their mine until the hot weather is over. Times are flourishing.

SOUTH FORK.—Cooper & Smith's arastra is running on their own ore. At the mine they are sinking a new shaft, air had in the drift. Ballou's arastra is running on his Manzanita ore. Crum's arastra is running on ore from Wright & Ormsby's ledge. Crum & Hubbard's Pacific mine is looking well. A new vein was found recently. Robinson & Co.'s arastra is running. H. Rothwell has been at work on his Crystal mine. Kingsbury & Dunham expect to resume work on their ledge soon. Water is getting scarce, although there is still sufficient for running the arastras.

Tuolumne

NOTES.—*Independent*, Aug. 11: Jim Gillis has struck a pocket at Jackass Hill in which he gets $20 to the pan. The pump has been taken out of the Rappahannock mine and the shaft allowed to fill up. Owing to the scarcity of water, the "Riverside" Co. has closed down the mill. The "Heslep" mill, at Quartz mountain, is running but few stamps for the same reason. The quartz mining outlook about Soulsbyville is very cheerful. The Patterson Mining Co. are putting a pump in their shaft; forty columns of iron pipe passed through town Wednesday. Rawhide, the once famous camp is deserted since Brisbie and the Rappahannock pump has pulled out and gone. The old store is closed.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Aug. 8: The streaks in the bottom of the winze sunk below the 2600 level, continues to show rich ore. The winze is fast nearing the 2700 level, at which point crosscuts will be run both east and west.

RICH STRIKE.—Some streaks of very rich black sulphuret ore have been found in the Keyes and Wheeler claim, on Seven-mile canyon, between the Omega and Winfield mills. A two-compartment shaft was sunk to the depth of 225 ft. They then sunk 20 ft through fine looking quartz, when ore was found. Where the ore first came in it was only an inch in width, but in going down four ft, it had widened to three ft. This is not all solid ore. There were streaks of rock that look like limestone. Against this, lie streaks of very rich black sulphuret ore. Several pieces were brought to town yesterday. An assay of the black sulphuret yielded: Gold, $569.18; silver, $1,469.90; total, $2,039.08. There is no mistake about the richness of the ore and there is indication that they are close upon a body of considerable size. The strike is in the range of the Monte Cristo, St. John's and Occidental mines.

STILL RICHER.—*Enterprise*, Aug. 9: Yesterday a number of samples of ore from the Keyes and Wheeler mine were brought up from Seven-mile canyon, the largest being several pounds in weight. These samples were of ore taken out night before last. The ore shows both black sulphuret and chloride of silver. An assay, made yesterday, went over $2,600. A hoisting engine will be put up and sinking vigorously prosecuted. This strike will doubtless cause the resumption of active prospecting along the line of the great eastern fissure. The Sutro tunnel showed nothing but barren country rock till this fissure was reached. Between it and the croppings lies the vast mass of vein material composing the ore channel of the Comstock. This eastern boundary of the great lode may yet prove as rich as the western, though probably not so extensive.

UNION CON.—*Enterprise*, Aug. 11: The north drift toward the Sierra Nevada line, on the 3000 level is now out 10 ft. Work has been discontinued in it till it can be timbered up at the point where it starts from the main west crosscut. The face of the drift is still in low-grade ore. Good progress is making in the joint Sierra Nevada winze below the 3000 level.

HALE AND NORCROSS.—Work in the winze below the 2600 level was retarded during the first part of the week by the heat and bad air that came in from the south drift of the Chollar, which was opened for the removal of the air pipes, drills, track rails and the like.

ALTA.—Drain boxes are being placed in the drift leading out to the Sutro tunnel on the 1030 level, and a pump tank is being construeted in the shaft at the same level.

OPHIR.—Have finished cleaning out the drift leading to the old Mexican shaft from the Central tunnel. A drift is now being run west for the ore vein.

CON. VIRGINIA.—The south drift on the 2700 level is going ahead at the rate of 16 ft per week. Good headway is making in the joint California drift.

MEXICAN.—The upraise from the 2900 level advanced at the rate of 10 ft per week, in hard rock.

SIERRA NEVADA.—North lateral drift No. 1 on the 2900 level is advanced at the rate of 20 ft per week.

YELLOW JACKET.—A considerable amount of ore is still being extracted from the old upper levels.

UTAH.—The repairs to the vertical shaft are completed, and work has been resumed in the west crosscut on the 1350 level.

CALIFORNIA.—The joint Con. Virginia drift from the C. and C. winze, at the 2800 level, is making good headway.

CHOLLAR.—No further prospecting will be done on the 2600 level until the new hydraulic pump is in operations,

ANDES.—Some quartz, giving good assays, has been cut in the west crosscut.

BEST AND BELCHER.—All is going on as usual in the lower levels.

GOULD AND CURRY.—The usual progress is being made.

SAVAGE.—The work of crosscutting will soon be commenced on the 2600 level,

SCORPION. Are still pushing the west crosscut on the 500 level.

UNION SHAFT. Are making repairs to the 2300 station.

Belmont District

NOTES.—*Courier*, Aug. 4: The Jefferson S. M. Co's mill produced bullion valued at $9,000 since the 21st ult. The mill is now undergoing repairs, and will soon be started up again. The Tybo mill will start up to-day on ore from the 2-C mine. The Prussian mine at Jefferson is said to be looking well and good ore is being extracted. A number of Eureka miners came in on Thursday to work in the Belmont.

Candelaria District.

NORTHERN BELLE.—*True Fissure*, Aug. 11: The daily output of ore is about 43 tons. Both mills are doing good work. The total bullion shipments for July were $53,531.12. There has been $10,192.25 in bullion shipped on August account up to the 9th instant.

MOUNT DIABLO. Some good chloride is being taken from the first level near the shaft, and some $70 ore from the Mount Diablo adit. The total bullion shipments on July account were $74,276.96. A shipment was made on August 3d of $10,424.87, and another on the 6th instant of $9,066.51.

LIDA VALLEY. Two lots of ore from the Morning Star, the first eastern extension of the Death valley lode, have been worked. One paid $207 per ton, the other $168. The ore from the Pontiac mine paid $377 per ton. The mill company, composed of Messrs. Stewart & Vollmann, is crushing ore from the mines in Death valley. The first bullion shipment was made the 5th instant, one bar weighing 1,100 ounces. The mill will be kept running indefinitely. The returns have just been received from three lots of high grade ore sent to San Francisco for reduction. The lot from the North Star paid $1,320; from the Morning Star, $750; and from the Sewana, $1,335 per ton.

Eureka District.

KATIE RYLAND MINE.—*Sentinel*, Aug. 11: Mark and Jim Cowling yesterday, at a depth of 30 ft, struck a body of free-milling ore, a specimen of which was brought to town and assayed. One part of it went $1,876, and another $5,060.30. It is chloride of silver in quartz. The mine was located in 1872 as the Paul Jones; afterwards relocated, and still later bought.

Humboldt District.

HUMBOLDT QUEEN.—*Silver State*, Aug. 8: Marion Howell, just up from Rye Patch, brings a specimen of ore from the Humboldt Queen mine. He says J. W. Mills is taking out, with four men, eight tons a day. He has on the dump 900 tons of ore that will average $100. The ore is assorted when taken out, the high grade being worth $300 to the ton, as has been proved by working tests. The ore on the dump is estimated to be worth $200,000, after allowing a margin for hauling and milling.

Pioche District.

OSCEOLA.—*Record*, Aug. 4: There has been an immense amount of gold specimens taken from the Osceola placer grounds. Mr. Godbe, Sr., has on deposit at the Desert Bank of Salt Lake a box containing a couple of thousand dollars' worth. One is a large granite bowlder thickly covered with the yellow metal, and valued at $400.

Safford District.

ONONDAGA.—Eureka *Sentinel*, Aug. 8: Francisco Thoma, who came up from Safford Monday, informs us that things are looking well. In the Onondaga they continue in ore as they sink. They have gone down nearly 100 ft in the prospect shaft, which is still in ore. Rock taken from the bottom of the shaft assays $300. The width of the ledge at the depth reached is unknown. The purpose of this shaft is to determine whether the Onondaga is a mine, that is, whether its immense surface deposit extends far below, and it will be sunk 500 ft. The shaft is being sunk through a solid body of ore, and the daily yield from it and from stoping the surface bodies is 20 tons. This will yield probably from $80 to $90 per ton. The Zanoli looks very fine. The drift from the shaft at a depth of 50 ft is in 40 ft. A body of ore nearly four ft wide has been followed for this distance. The ore is yellowish green carbonates, which will average about $60. No shipments have been made, and the ore accumulated lies still on the dump, on which about 150 tons are piled up, worth about 60 ounces per ton. There are some thirty men at work in the camp.

Tuscarora District.

COLUMBUS.—*Times-Review*, Aug. 6: The mill at Columbus has suspended for a few days, awaiting the arrival of ore from Cornucopia. A road is being graded to the Polari's mine, which will be completed in a few days, when ore hauling to the mill will commence. There is ore enough, easily accessible, in this mine to keep the stamps running continuously. Clark and McClay's concentrator is accumulating high grade concentrations for shipment. The Blue Jacket mine belongs to the Blythe estate, now in the hands of the executors in San Francisco, but arrangements will be consummated for the early extraction of ore. The prospects for the district were apparently never more favorable than at present.

ARGENTA.—East drift, 300 level, extended 11 ft. North crosscut, 400 level, 13 ft.

INDEPENDENCE.—Total length of drift south, 400 level, 919 ft. Drift north, 300 level, total length, 670 ft.

GRAND PRIZE.—West drift 300 level, extended 12 ft. South drift, 10 ft. South drift, 400 level, 14 ft.

NAVAJO.—*Times*, Aug. 3: During the past week work underground was suspended for a time, owing to repairs being made on the hoisting engine. Have commenced cutting a station at the 650 level. Foundation for the compressor has been completed. Are ready to place the machinery in position as soon as it arrives.

BELLE ISLE.—During the week the hoisting engine has been under repair, and work suspended. Total length of drift north on the 450 level, 184 ft: progress, 7 ft.

NORTH BELLE ISLE.—Fair progress has been made in extending the drift south on the 300 level. Total length, 463 ft.

INDEPENDENCE.—Total length of drift south on 400 level, 885 ft. Progress during the week, 29 ft.

ELKO CON.—That portion of the building covering the engine, machinery and boiler has been completed, and the gallows frame placed in position. Will start the machinery for trial the latter part of this week.

GRAND PRIZE.—South drift, 400 level, is in 65 ft: progress for the week, 15 ft. The vein is two ft wide. The stopes below this level produce some good ore. The rebuilding of the works will soon be completed.

ARGENTA.—West drift, 300 level, extended 10 ft. The face of drift is in favorable ledge matter. Have started a crosscut north, on the 400 level.

ARIZONA.

NOTES.—Prescott *Courier*, Aug. 4: Bigelow and Hatz are shipping ore from mines owned by them in Hassapampa district. The United Verde Copper Co.'s smelter has turned out its first bars of bullion. The Howell Co.'s stamp mill will be run the first time Saturday next, on Belle gold ore. Gavin & Co.'s shaft in the Pine Spring mine is down 43 ft, at which depth the ledge is large; ore worth over $20,000.

LANE DISTRICT.—J. M. Lane has driven a tunnel 300 ft on the Three Sister mine. He was here recently with samples of his ore, which is good for $300 to the ton. He will soon have a batch worked in the Tip Top Co.'s mill.

BLACK HILLS.—E. J. Austin tells us that the furnace will, to-day, commence running out copper. To give an idea of the sort of mines they have over there, it is but necessary to state that a miner named Lynch has for a month taken out at least a ton of ore daily, which ore goes from 40 to 60 % in copper.

PECK DISTRICT.—W. A. Rowe returned from Peck district a couple of days ago. The Black Warrior mine is looking fine. The mill is running. A shipment of three bars of bullion, 900 fine, reached Prescott yesterday. L. Able's West Oro Bonita mine has sulphuret ore, which assays $942 per ton. Two carloads of machinery reached Turkey creek, Sunday. C. C. Bean has made arrangements in New York for a smelter for Copper basin.

SILVER KING.—Pinal *Drill*, Aug. 4: In the Silver King work goes on as usual. At the mill they had to hang up the stamps owing to lack of water. In reference to the report that dividends are to be suspended, the *Drill* says: "The Silver King may be weak in the stock board, and who cares except the gamblers? But the Silver King is stronger than ever in the earth, and the company employes more men than ever, and have more rich ore thanit can handle. They pay their men who work at the mill and mine, and whether they pay any dividends or not doesn't affect us or the mine. There is probably not over 10,000 shares held by outsiders. All the rest is owned by the managers of the company. The Silver King will have to build a 100-stamp mill at once, or be choked with ore, and they are probably saving their dividends for the purpose."

NOTES.—On the Monarch of the Sea, they have greatly enlarged their working force. They are taking out good ore. It is undoubtedly the coming mine in Arizona. They have worked at it quietly, but to-day they employ more men than any other mine in the vicinity with the exception of the King. They have cut through the hill 275 ft and find metal everywhere. On the Eureka, they have this week shipped 15 bars of bullion; value, $1,500 to $2,000; 15 men are employed in the mine. On the Surpriser they are working 10 men; they have opened four drifts and the result has been good gold quartz.

CRITTENDEN.—Tombstone *Epitaph*, Aug. 7: The mining properties in that section seem to be looking up, and a determined and united effort is being made to secure the erection of a smelter at Crittenden. It is expected that operations will be resumed on the Gringo mine, the property of a West Virginia Co., on the 15th. This company has a good amount of high grade ore on the dump. In Temporal gulch, Tom Hughes and Dan Lyons have the main shaft on the Rupert down over 80 ft in a fine body of ore. The Blue Nose, Patagonia district, owned by Messrs. Clay and Dunn, is being worked by a single shift, and the ore is shipped to the Benson smelter, with good results.

COLORADO.

NOTES.—*Gazette*, Aug. 4: A large quantity of surface quartz shipped from the Niagara lode, Spring gulch, to the Mott concentrating and reduction works, runs from 4 to 6 ounces in gold to the cord. An assay of ore from the Perkins tunnel lode shows 13 ounces gold, 25 ounces silver, total value $292.78. Ore covered with free gold continues to be taken out. The Mountain City lode, in Cascade district, is showing well in the shaft, now 135 ft deep. There are 14 inches of first class concentrates on the hanging wall. About 20 tons of rich smelting ore have been shipped from the Champion to Black Hawk during the week; two carloads of high grade from the Donaldson mine. The shipments preceding these returned from $170 to $190 to the ton. On the Freeland mine, recent developments have opened up far richer bodies of ore than have ever heretofore been struck. In the east lower level of the Eclipse mine six inches of solid gray copper that assays $1,090 per ton has come in on the hanging wall. A shaft 9 by 4 in the clear will be sunk immediately at the entrance of first level west.

ROLLINS.—*Register-Call*, Aug. 3: Yesterday there was left at the First National Bank, 138 ounces and 8 pennyweights of egg-shapped gold retort, produced by 31 stamps during the past two weeks.

A GREAT CORPORATION.—The incorporation papers of the Omaha and Grant Smelting Co. were filed with the Secretary of State on Friday. The combining of the Grant and Omaha Cos. makes the greatest ore smelting company in the United States. The capital stock is fixed at $2,500,000, and the company is to exist for a hundred years.

IDAHO.

NOTES.—*World*, Aug. 3: Don Henderson and Hugo Bayhouse discovered a ledge near the head of Henry creek the other day that carries free gold. The vein is four inches wide, and the ore runs $300 per ton. Henry Clifton is placer mining the other side of the Moore creek summit, near the Banner road. The ground is five ft deep and pays from the grass roots down to the bedrock. It is what is known as the Tatro diggings. The ground is being worked by hydraulic process. Curtis Estes arrived yesterday from Yankee Fork. The Custer mill is running on ore from the Unknown mine. The owners of the Montana mine will have their low grade ore, 500 tons, put through the Custer mill. Joe and Wm. Galatian are developing the Whale. They will make a shipment of high grade ore. The low grade will be crushed in the Custer mill. Mr. Estes showed us specimens from his placer claim on Estes mountain, the largest worth $27.

WOOD RIVER.—*Times*, Aug. 1: The Bullion Con. M. Co. are to erect at once a very complete concentrating mill, the machinery for which is already here. It is to be provided with massive appliances, embodying the latest improvements, selected with great care after visiting the various manufacturers in the Eastern States and a careful inspection of the most successful mills now in operation. The capacity is 50 tons daily, with power for 100 tons. A. P. Minear is superintendent.

THE O. K. MINE.—A lot of 62 tons which was sent to the Philadelphia Co.'s smelter, above Ketchum, Saturday last, was purchased by that company. After deducting all expenses, including hauling, railroad transportation and smelting, Mr. McQueen received a net return from the 62 tons of $8,129.81. The ore was sampled at 124 ounces in silver and 71 lead per ton, all through.

SAWTOOTH.—The Solace, Mountain King, Silver King, Vienna, Scotia, Hidden Treasure, Sunbeam, and other mines are being developed in the Sawtooth section. Mr. Vernon, of the Columbia and Bear Mill Co., will start up the mill Saturday, taking all the custom ores offered. The mill will run six months at least, by the leaching process. The Hidden Treasure mine is one of the most valuable prospects in the Sawtooth country. Over 100 miners are at work in the district. This does not include Vienna and immediate vicinity.

THE PHILADELPHIA SMELTER. Ketchum *Keystone*, Aug. 1: The two new 50 ton furnaces at the Philadelphia smelting works, which are constructed after the pattern of the famous Grant smelter, at Denver, stand complete and in full operation, with a capacity of 100 tons. These furnaces, which are perhaps two of the best in America, were built to accommodate the increasing output of our mines and prospects and now have met an urgent demand for increase reduction facilities. It is estimated that as many as 50 large teams are employed constantly between the mines and sampling works and the smelters. The Philadelphia Co. has secured all the Wood river ores and there now seems no question on the part of miners but that of getting out the mineral.

MONTANA.

FLINT CREEK.—Cor. *New Northwest*, Aug. 3: The Shields mine, belonging to Edgar, Godfrey & Co., is developing first-rate, a large quantity of very fine ore having been taken out during the last fortnight. This company owns or has the controlling interest of six mines, beside mill and smelter sites.

A NEW DISTRICT.—Quite an interest has been created about Pioneer, in regard to rich gold and silver quartz discoveries at Henry Martin's camp, near the headwaters of the left hand fork of Gold creek. It is reported that assays of the ore have run over 400 ounces in silver and $25 in gold per ton. The camp is about seven miles from Pioneer.

SUMMIT VALLEY.—Butte *Miner*, Aug. 1: During the past week, silver bars valued at $47,024 were shipped through Pacific Express, 10 tons of which are credited to the Moulton, valued at $12,950; 10 to the Alice, $15,004, and 10 to the Lexington, $19,024. Gold dust was also shipped by Donnell, Clark and Larabie valued at $21,400.

ALICE.—The 80 stamps of the Alice mills are dropping upon about 90 tons of ore per day, with average battery samples of 41 ounces.

MOULTON.—Ore is being stoped from the 200 west drift, where the ledge of high grade is looming up bigger than ever, having widened to 6 and 7 ft of solid pay ore of high grade clear across the face. The mine may be said to be looking better throughout than ever before.

NEW MEXICO.

THE OLD MAN.—Of this claim, at Camp Fleming, the South-West *Sentinel* of the 4th says: Notwithstanding the small amount of development work, two thousand tons of ore are in sight, and four hundred on the dump that will average one hundred ounces in silver to the ton. In addition to this, three hundred sacks of high grade ore that will average four hundredounces of silver are awaiting shipment East for treatment.

TURNER.—The Turner mine at Bald mountain, is the richest yet discovered in the district. The average assay return from eight assays taken from the bottom of the shaft was $424 of silver to the ton.

SHERMAN.—Some choice ore is being produced from the Sherman mine by the Williams Bros. They have continued the original tunnel, which has already gone through three rich pockets of ore, and they have just struck another, which is even richer. Some of the ore runs into thousands of ounces of silver to the ton, and a low average would be 30 ounces.

SILVER CITY.—*Southwest Sentinel*, Aug. 8: A large body of ore full of horn silver and chlorides has been struck in the main shaft of the Old Man. The ore will average 500 ounces to the ton, and covers the entire bottom of the shaft, at the depth of 60 ft. Rich ore has also been struck in the incline, the mouth of which is 100 ft north from the main shaft, and with which it will connect. One hundred ft west of the incline, another rich body has been found, at the depth of about 10 ft. This indicates a triangular block of ore, with base and perpendicular of 100 ft each, and averaging 250 ounces to the ton.

OREGON.

RICH COPPER ORE.—Walla Walla *Union*, Aug. 4: A year ago a vein of copper ore was discovered 40 miles northeast of Baker City. The indications are rich; specimens assaying 80% of copper and $75 per ton of gold and silver. A company has been organized in Walla Walla, and men have commenced work. This company have a continuous claim 600 ft wide by 12,000 ft long. Mr. Booth, of Seattle, reports that he measured the croppings on one of the claims, and believes that it is the largest and richest body of copper ore that has ever been discovered in the United States. Captain Hoasten of the Lake Superior copper mines inspected the mine and reported to the company that if there is one-tenth of the ore there that the croppings indicate, the mine is worth millions of dollars.

The Triennial Conclave.

Who are the Knights Templar?

The origin of Masonry is shrouded in the haze and twilight of antiquity. Whether it originated in the mysteries of Isis and Osiris in Egypt, or of Eleusis in Greece, or had some relation with the sun and star mythology of Persia, as many think, or originated at the building of King Solomon's Temple, as our best Masonic archæologists believe, is a matter really of very little consequence. All admit that it is the most ancient fraternal Order in the world, the trunk-principle, the mighty tree; under whose boughs all other secret Orders have sprouted, and drawn their vitality and inspiration. The early Masons were a peaceful class, fond of science and occult studies. Possessing considerable knowledge of the laws of proportion, harmony, symmetry and beauty, and bound together by mystic words and signs, they went forth from some central school or Lodge, to build the palaces of Kings and the fanes of religion. Their symbols have been found under the obelisks at Alexandria, on the ruins of Karnac, and their cabalistic marks may still be seen on the magnificent cathedrals, the spacious arches, and pilasters of mediæval Europe!

But no dark cloud of myth or tradition hangs around the origin of the Order of Knights Templar. We know its date, and the path it has come. It was the child of war, born sword in hand, and cradled on a shield. Its history begins with the crusades, those tornadoes of religious and military enthusiasm which blew at intervals across Europe for three centuries. At the breaking out of those wars, the sons of noblemen, stimulated by piety, love of glory or adventure, wild, restless spirits who loved martial sports and the bustle and excitement of camp-life, offered their services, and were taken into the pay of the great barons and chieftains. The prowess, the daring and renown of these valiant Knights, have been celebrated in romance, art, poetry and song. Among the numerous Orders that sprung from this form of Knighthood, the Hospitalers and Templars are the best known, and most distinguished. The Hospitalers, or Brothers of St. John of Jerusalem, or Knights of Malta, as they were subsequently called, were instituted in 1040 for the purpose of nursing the sick and wounded crusaders, and consoling the dying. It was the first Sanitary Commission that ever followed the burnt path of war. After being driven out of the Holy Land, they first occupied the island of Rhodes, and then Malta, whence they were expelled by Napoleon Bonaparte, in 1798.

The Order of Templars was founded in 1118. Nine French gentlemen, pious and valiant Knights, bound themselves under solemn vows of charity, poverty, and obedience, and to employ their swords in defense of poor pilgrims on their way to the Holy Sepulcher! Their rigid austerity, their valor, and enthusiasm soon attracted the attention of their King, Baldwin II., who gave them an apartment in his palace, near the supposed site of King Solomon's Temple. Hence they became known as Knights of the Temple or Templars. The rules of the Order were prepared by the Council of Troyes, and ratified by the Pope. They were commanded to wear white mantles in order to distinguish them from the Hospitalers. The Red Cross was also prescribed by this Council as a badge of distinction, and was worn over the heart. For many years the Templars lived in great poverty, fed and clothed by charity, and giving all they could spare to the poor pilgrims who had been spoiled by the enemy. So poor were they that two often rode the same horse, and a rough, cheap dagger was all they could offer as a ransom for a captured brother. They were very pious, in accordance with the gloomy aceticism of the day, that believed the Devil was in everything bright, beautiful, and enjoyable, and could only be driven out of human nature by a watery diet, horrid smells, and a bad air. The motto upon their banners, "Not unto us, Oh Lord, not unto us, but to Thy name give the glory," was no empty declaration of self-abnegation. They ate in silence. It was unbecoming a good Knight to indulge in boasting or frivolous conversation. The Evil One was concealed in a laugh or joke, and to kiss even a mother or sister was considered as dangerous to the purity of the heart and desires, as the touch of frost on flowers.

But this rigid, monkish austerity did not last long. The Count Anjou made a pilgrimage to Jerusalem, and became so deeply impressed with the piety and valor of the Order that he joined it; and his example was soon followed by other pious and chivalrous princes. The Order rapidly became the most popular and powerful in Europe. The spoliation of the heathen, and the donation of kings and noblemen made it extremely rich; and the vow of poverty was forgotten. The Templar never lost his courage, but the stout arm which had flashed the sword where the battle raged the fiercest against the Saracen, in luxury and ease, had lost its cunning; and when the Great Saladin mustered his hosts to recover Jerusalem, he won an easy victory at the battle of Hittin. When the Crusaders were finally driven out of Palestine, the Templars were the last to yield. They threw themselves into the strong fortress of St. Jean d'Acre, and there fought their last battle for the possession of the Holy Sepulcher, only eight or ten escaping the terrible carnage. The shattered remains of the Order fled to Cyprus, and elected Jaques De Molay, Grand Master, and for a season prosperity smiled upon them, and they again became rich and powerful. But their wealth became an object of envy to Philip IV., King of France, and he persuaded Pope Clement V., a servile minion he had elevated to the Papal See, to suppress them. They were accused of the abominable heresy of Ophidic, Gnostic, and even Mohammedan practices; especially the worship of the Baphomet, a human figure carved out of stone, with two heads, male and female, and entwined with serpents and astrological devices. De Molay was enticed to Paris, and treacherously seized and burned alive. A large number of his followers suffered the same fate. Fifty-four Templars were burned in Paris the same day. With the death of Molay, it was supposed the Order had perished, but he, in anticipation of danger, had appointed John Mark Samienius his successor; and the chain of succession of Grand Masters from him, has never been broken.

The encampment of Baldwin, established at Bristol, by Richard I., on his return from the Holy Land, preserved the ancient costumes and ceremonies; and this, in connection with the one at York, and another at Bath, constitute the original Encampments, from which all the British and American Commanderies now in existence have derived their authority.

The Templars, broken up as a military Order, no longer permitted to poise the lance or join the tourney, or hold public meetings, met in secret places, in caves and glens, and the somber depths of the forest, and agreed to make war upon vice in all its ugly shapes, using their ancient weapons of bloody strife, as the symbols and emblems of a spiritual warfare. The Knight, wearing the cross, wielding his sword in defense of innocent maidens, destitute widows, helpless orphans, and the Christian religion, may come into sweet fellowship with the spirit of the Crucified One, which has been aptly called an "enthusiasm for humanity." As long as the soul lives in the body, it carries about a burning taper that may easily be blown out. The heart should ever be clad in penitential garb, for what is life but a pilgrimage, and are we not all looking anxiously forward to that asylum, that house not made with hands, eternal in the heavens. And that must be a very cold, apathetic nature that can stand around the Knightly triangle and join in the ascension hymn, and not feel that life is more than a thought or memory, more than a blossom on the stem of organization; that the soul has powers which sweep beyond the world of time and sense, and carries within it the earnest of a grander destiny.

Another Big Hydraulic Pump.

A contract with the Risdon iron works, San Francisco, has been signed for another big hydraulic pump. The pump is to be completed within 100 days. It will be of the same capacity as that now in operation. It will be placed at a point ten to twelve feet below the 2620 level.

At this place will be constructed a station twenty-five feet wide, fourteen feet high, and from 90 to 100 feet long. The pump will have upon it over 200 feet more pressure than that at the 2400 level. Once it is in and ready to run, it will release the Cornish pumps now in operation below the 2400, and they will be used below the 2600 level to pump up to the lower hydraulic pump.

The station and foundations for the new pump will be completed as soon as possible, and the several parts of the pump will be set up as fast as received from below. Such parts as will be first required will be first manufactured.

This pump will cost a great deal less than the first. There will be no costly surface engine required, as for the first pump, nor will it be necessary to put in new pipe all the way down. The cost, as divided up among the several companies interested in the shaft, will be less than twenty cents per share, and will be so divided that never as much as seven cents per share will be required at any one time. In fact, the cost of the pump will not be noticed by the stockholders.—*Virginia Enterprise.*

The Philadelphia Smelters.

The New Furnaces Completed.

From the Ketchum (Idaho) *Keystone* we take the following:

The new furnaces at the Philadelphia smelters have a capacity of fifty tons each instead of forty tons, as many of the newspapers have seemed to suppose, thus making a total capacity at the works of 180 instead of 160 tons daily. They now stand complete, with the exception of a few details, and are being dried out preparatory to receiving the blast, which will occur within one week. They are accompanied with every improvement possible, and stand as model types of smelters. The machinery in other parts of the mill is complete in every detail, and the necessary additions for the increased capacity, such as workmen, fuel, etc., have been secured.

The ore receipts have perceptibly increased during the past two weeks, and an immense quantity has accumulated in the new main buildings and ore platform recently built to accommodate the surplus from regular hins. It now continues to arrive at the rate of about sixty tons daily, exclusively of ores from the Conklin sampling works. The rate of receipts, together with the large quantity on hand, will be seen as quite sufficient to supply the full capacity henceforth, growing patronage not considered. The chief supply continues to come from the Elkhorn mine, which ships from ten to thirty tons daily, while the Ontario is making its appearance among the first shippers, and will probably send in 600 or 700 tons during the season.

The bullion shipments from the old furnaces continue at a lively rate, and amount to 100 tons in the past four days. The daily output has increased somewhat, and now averages about sixteen tons, over 300 bars. An additional carload of coke has been ordered to accommodate the new furnaces, and this, together with a general increase in ore shipments, will greatly increase the teaming business hereabouts.

The effect of the new furnaces, and the certainty of an increase to 180 tons daily capacity, is quite noticeable in the stir about Ketchum, the confidence in our business men, and the general improvement of times.

It is now settled that the Philadelphia company pays more for ores than can be obtained by patronizing any other market, and the reluctance on the part of a few miners to ship in their ores can be attributed only to the want of a fair understanding. The ores of this section have been tried here and adapted to proper treatment, while they have not been sufficiently experimented upon in other markets to insure a set process and set price, or cost of reducing. Omaha prices are given in cash here, and miners are thus enabled to dispense with the bother of handling and shipping, to say nothing of the annoyance of waiting a long time for their money. Even the interest saved should be sufficient inducement for all.

The operation is the greatest in several Territories, and its present and prospective success means bottom to our mines, and permanence to our towns. It is the nucleus of a growing and industrious center, where the busy efforts of miner, miller and merchant unite in building up that which is destined to prosper and excel, in the reflections of enterprise and assiduity.

MINERALS IN THE GABILAN RANGE.—Gold and silver bearing quartz has been discovered in the Gabilan mountains, northeast of Hollister. An assay of the croppings of one of the ledges shows about $18 silver and between $2 and $3 gold; of the other ledge, between $2 and $3 silver and about $9 gold. This indicates the existence of good pay ore, and will revive the interest in the story of rich gold bearing quartz having been discovered in the mountains not far from Hollister, by a party in pursuit of horse thieves. This was in an early day, and according to current report the ledge was fabulously rich. As the story goes, one of the party was sitting down, preparing his pipe for a smoke, and discovering that he had lost his flint, he knocked off a piece of quartz that cropped up in front of him. What was his surprise to find it streaked and flecked with gold. He filled his bullet pouch with the precious ore, and the small quantity thus obtained assayed in the neighborhood of $20. Since then no one has ever been able to find the spot, although hundreds have hunted for it.—*Gilroy Record.*

COPPER IN UTAH.—Mr. Williams had just returned with samples from the O. K., the Lake Superior, the Comet and other copper mines in Copper Gulch. Of the first, owned by A. G. Campbell and others, the shaft, at a depth of 200 feet is full size in ore, oxide, carbonate, sulphuret, with a good deal of iron; may he it will average 15 per cent copper. The Lake Superior have 70 tons of selected, perhaps 20 per cent copper ore, saved in sinking 70 feet, and their waste is 5 per cent copper. These mines are within a few miles of Milford. The Comet and other Copper Gulch mines are the scene, since their consolidation, of a good deal of activity. With more work the prospect improves. If water enough can be got out of the vein for machinery and concentrating, and the copper ore continues to bear silver, this must prove a very valuable property in time. There is said to be several hundred tons of ore ready for shipment in the Star district, and good judges look for the development of some paying mines there within a short time.

Taylor District.

Taylor mining district is situated in the low hills across the valley from Ward. This camp is a lively little berg, and the sound of the hammer and saw is everwhere heard in the erection of new buildings. The town—or rather the two towns—are located on the north and south of the mines, about a quarter of a mile apart. The Monitor is working the usual number of men, extracting plenty of ore to keep the mill going, and the mines are looking better than at any time since work was commenced. To the men who control the Monitor company—Robert Briggs, W. N. McGill and W. G. Lyons—Taylor district owes its present prosperity. By their indomitable energy and perseverance they wrung wealth from the bleak and barren hills when no one else was willing to invest a dollar of capital in the enterprise, and showed to the outside world that the district had merit, and could stand on its own showing. These men made Taylor what it is, and to them, in a great measure, will be due the credit, if it should prove to be one of the best mining districts in eastern Nevada.

The Argus Company.

The Argus Company, of which Mr. Joe Carothers is manager, also have some valuable mines, which they are now developing. They have commenced the erection of a twenty-stamp mill down the valley, at a convenient point, which will probably be ready to drop stamps in three months. They are developing their mines, and, we are told, with very flattering success.

Other Mines.

Besides these there are some other valuable mines in the district, owned by poor men, who are doing all they can to develop them. The Old Brown Bull, a half-mile east from the Monitor, is one of the most promising mines in the district. It is the property of Robert Simpson, of the Ward Reflex, Wm. Pryde and Wm. Borthwick. They have several men at work, and the developments are most encouraging. We learn they have refused an offer of $15,000 for the property.

The Jennie June, owned by John Verzan and others is another location of much promise, and is being rapidly developed.

"Blanket Ledges."

The mines of Taylor are what are termed blanket ledges, which scientists tell us do not go down. It is true the Taylor mines have not been prospected to any great depth (about 75 feet being the deepest), but as far as they have gone the ore goes down and its quality improves. Ore is where you find it, and not where the scientists would have it, and the Taylor mines are as likely to reach depth as any others. One thing we predict, that Taylor district has by no means seen its best days, and that for several years to come—even if the ore does not reach great depth—it will be a paying investment for the companies operating there, and a healthy and prosperous mining town will spring up around it.—*White Pine News.*

Utah Sulphur.

Twenty-five miles east of Black Rock station on the Utah Central, on Cove creek, there are immense deposits of sulphur in almost a pure state. This has been examined and reported on by various persons, all of whom agree in regard to the extent and value of the property, while experiments have been made in digging down, and also in boaring, to a depth of thirty feet, all the way through sulphur, so that the deposit is considered as almost unlimited in quantity. One report places the amount in sight at several million tons, but be that as it may, the mines are to be worked and the product will find ready sale in the market. C. W. Scofield has purchased the property and already has his machinery at Ogden for refining the sulphur. The machinery is to be shipped to the mines, and will be capable of turning out 150 tons of pure sulphur per day. The process of refining is that of retorts in which the crude material will be placed, there to be treated by steam under a pressure of eighty pounds per square inch, which will melt the sulphur and separate it from the foreign substances. This pure sulphur will be run into cylindrical blocks weighing 200 pounds each, ready for shipping. J. T. Jeffries, who is associated with Mr. Scofield, has had much experience in the business, having erected and managed the works at Humboldt, Nevada. Nearly all the sulphur used in the United States is imported; Sicily sending us 150,000 tons per annum. Besides giving large tonnage for our railroads in taking this sulphur to market, the works will employ over fifty men. There is also another important feature about this enterprise. The mines are twenty-five miles from the Utah Central at Black Rock, while it is nearly one hundred miles to the Denver & Rio Grande. George Goss and Mr. Scofield have already arranged and contracted to build a road to connect with one of the above lines, and it is only a question of terms, as we understand, between the sulphur interest and the railroad companies, as to which route to build. Work is to be commenced within a short time on the railroad, while the sulphur refinery will soon be in operation.—*Salt Lake Tribune.*

Emery's Drill.

Several months ago, says the *Nevada Transcript*, we published a short item saying that a rock drill was in process of invention at Nevada city, which, if we were not much mistaken, would, when perfected, revolutionize quartz mining on this coast by providing a machine equally as effective as the high priced drills already in the market and at greatly reduced cost. We referred then to an invention that was being worked upon by John Lawrence and Chas. O. Barlow, proprietors of the Plaza foundry at this city, and superintendent Emery of the South Yuba mining and tunnel company. For a year past these three gentlemen have been devoting their time and experience to the subject, and after numerous disappointments it can safely be asserted that they have now accomplished what they set out to, for the invention is at last perfected. A patent has been issued in Mr. Barlow's name, and its manufacture will soon be inaugurated at the Plaza foundry on an extensive scale. Yesterday we visited the foundry, where one of them is now on exhibition and can be seen daily in operation.

It consists of an upright column carrying a sleeve and trunnion-bearing that give a universal motion by which the drill can be turned in any direction. A guide bar about 4½ feet long is attached to the trunnion-bearing for supporting the mechanism of the apparatus. It can be moved its own length by a feed-screw. On the front end of the guide bar is a screw for holding the machine in position. Attached to the guide bar is a casting that holds all the mechanism of the drill. Near the top of it is a steel mandril or arbor fitted so as to slip freely through the casting. On the front end of the mandril is screwed a chuck for holding the drill, and on the back end is a pin-wheel for turning the drill. The blow is given on the rear end of the mandril by a swinging hammer. The hammer weighs from 10 to 14 pounds and has a steel handle twenty inches long. The power is given to the hammer by means of one or more springs. The springs are compressed by an eccentric working on a traverse shaft driven by an eighteen inch hurdy-gurdy wheel inclosed in a cast-iron casing. The cam operates on a friction roller attached to a projection from the hammer handle. On the end of the traverse shaft opposite the wheel is a worm working in a worm-wheel that is attached to a pin-wheel. An endless chain works from this pin-wheel to the pin-wheel on the mandril, for the purpose of turning the drill.

The hammer can be made to strike as hard a blow as tempered steel can stand, and at the rate of five hundred blows a minute. The inventors make a strong point over other drills in the fact that this drill is by a spring pressed against the bottom of the hole when the blow is imparted, thus preventing any pulp from getting between the point of the drill and the rock. By the means of the oscillating hammer in connection with the springs a heavier blow is delivered than can be by any other means ever yet discovered.

The machine can be run by a hurdy-gurdy wheel attached directly to it, or by means of air or steam-working in a single acting trunk engine of 3½ inches in diameter by a four inch stroke. The engine is connected on the machine, the crank being attached to the same point that a hurdy would be when used.

Two of these drills have been in use for some time in the tunnel of the claim on the South Yuba river, of which Mr. Emery is superintendent. The rock there is as hard granite as can be found in the State, and the drills readily push 1¼ inch holes into it at the rate of five feet an hour. The inventors claim it will do more drilling for the amount of power used than any drill ever made.

Midsummer Ice.

Naturally formed ice in midsummer is one of the peculiarities of this peculiar country. We can offer the enquirer a winter without ice, and a summer with it, if he choose. We can give ice in July from the bowels of the earth or the summits of the mountains. We read in a Nevada exchange that Aurora has the finest ice factory in the world. In the old Del Monte workings, at a depth of 100 feet, two deserted tunnels intersect. There is a very strong draft coming through each tunnel, and meeting at the said point of intersection, lowers the temperature clear beyond the freezing point. There is quite a seepage of water from the upper workings coming down, and as fast as it drops through, at all seasons of the year, ice forms.

Quite a different thing is an ice factory in the Bear valley, about ninety miles east of Mt. San Bernardino. There is a dairy in this once famous valley, and the firmest butter is made even in summer time. A correspondent who visited the place July 24th writes:

About two tons of butter are produced in the summer season. As this is the middle of summer, they now have about a ton of the very best butter on hand. It is very cold in the valley at night, and a cup containing about an inch of water placed by your correspondent within eight feet of a blazing fire, that was kept up all night, was frozen in the morning. Snow fifteen or eighteen feet deep lies in the deep canyons of Old Grayback, a few miles away. Under these circumstances, it is not strange that the butter is well preserved.

Useful Information.

Best Time to Cut Timber.—A correspondent of an eastern journal says: "For strength, beauty and durability I have found August, September and October the best, and February, March and April the worst months to cut wood. A red maple, cut in September will keep in a round log perfectly white and sound until the next August; while one cut in March will begin to blacken and decay by the middle or last of June. This is not copied from any scientific work, but is what I have found to be a fact by many practical tests. Gray birch cut in September will keep in a good condition until the next September if left in the woods cut in four-foot lengths; while if cut in March and left in the same way it will be nearly worthless by the first of August; at least, such is the result on my land. White pine, like the red maple, keeps white much longer if cut in September than if cut in March, and is not injured by the worms as much. I have found that wood dried slowly in a low, cool place is better than dried quickly in the hot sun, even though cut in summer. May this not, in a measure, account for wood being better cut in autumn, it having the long cold winter to dry in?

How to Remove a Tight Ring.—A novel method of effecting the removal of a ring which has become constricted around a swollen finger, or in any other similar situation, consists simply in enveloping the afflicted member, after the manner of a circular bandage, in a length of flat India-rubber braid, such as ladies make use of to keep their hats on the top of their heads. This should be accurately applied, beginning, *not* close to the ring, but at the tip of the finger, and leaving no intervals between the successive turns, so as to exert its elastic force gradually and gently upon the tissues underneath. When the binding is completed, the hand should be held aloft in a vertical position, and in a few minutes the swelling will be perceptibly diminished. The braid is then taken off and immediately reapplied in the same manner, when, after another five minutes, the finger, if again rapidly uncovered, will be small enough for the ring to be removed with ease.—*Langon Gaz. des Hop.*

How Some Cooking Wines are Made.—A distinguished Frenchman, M. Scholl, breakfasting at home recently, says: I tasted a dish of stewed kidneys which I shall not soon forget. At the third mouthful I stopped. My palate and lips were on fire. "What have you put into this sauce?" I asked my cook. "Sir, as I had not the key of the cellar, I bought a bottle of Chablis at the grocer's for 1fr. 50c." "Is there any left?" "Yes, about half." "Bring me that Chablis?" "I poured a spoonful into my glass," continues Mr. Scholl, "to taste this new sort of wine. It had no taste. There was no trace even of raisins, nor of brandy. But I burned my tongue with it, and that horribly. I had the stuff analyzed by a chemist. It was merely water mixed with sulphuric acid. The maker had not even gone to the expense of a bunch of raisins or a few drops of alcohol. This composition is sold openly at 1fr. 30c. a bottle, under the name *Chablis superieur*. What must inferior Chablis be?

Is Rubber Absolutely Water-proof?—Some one asks the *Scientific American* the following question: Is it possible for water to be forced through rubber which is warranted to be water-proof, supposing that the rubber is supported by a hard substance so as to prevent its stretching; or suppose it to be stretched, how thin a piece would prevent the water from penetrating it? If it will penetrate a thin piece and not a thick one, how thick should it be in order to prevent water from coming through it? That journal answers as follows: It is probable that rubber that is warranted water-proof is water-proof under ordinary circumstances. Water under pressure will pass through many substances that are considered water-proof when no pressure is applied. You may possibly obtain pure gum that will stand considerable pressure if it is properly stayed or backed.

To Prevent Fading of Goods in Shop Windows.—A Swiss scientific journal recommends a remedy for an evil which dry goods shop keepers have long experienced, much to their annoyance and cost, namely, the fading of many kinds of colored goods, when exposed in shop windows, even apart from the direct action of sunlight. The authority referred to says that this fading or bleaching is brought about only by the white rays, which can only pass through glass that is itself perfectly colorless. It has been found that if, instead of such colorless glass, the window panes consist of glass which is slightly yellow, the fading process is prevented. Where the glass is colorless and cannot be replaced by slightly yellowish tinted glass, the desired effect may, it is said, be produced by simply giving the panes a coating of copal varnish.

Cleanliness of Sinks.—One of the most prolific causes of defilement and offensive odors in kitchen sinks and their outlets, is the presence of decaying grease. This comes from the emptyings of kettles in which meat has been cooked, in the dish water, and in the soap. The grease lodges in every crevice, and catches at every obstruction. A remedy may be found in the use of the common alkalies instead of soap—aqua ammonia in washing clothes, and borax in washing lawns and laces, and washing soda in cleaning dishes. These alkalies prevent a solid soap from forming in the sink and its pipes, and neutralize all effects of decomposing fat.

Detecting Leaks in Glass Jars.—Sarah Jane writes to the Chico *Record* as follows: Some housekeepers have bad luck in keeping fruit in glass jars, owing to an imperfect closing of the jars. I have tried this plan with much success: Upon filling the jars, I screw on the covers as closely as possible, and invert the jar upon the kitchen table. If it is not perfectly air-tight it will either leak or bubbles will rise to the surface and plainly show the imperfection, before the fruit is cold, when the cover can be tightened or the fruit heated again. By setting them with the tops up, imperfect sealing cannot be detected until fermentation takes place, and the fruit is spoiled.

A Lake of Ice.—There is a lake on the Saw-Tooth mountains, California, that probably has no equal in the United States. It is about sixty-five miles from Bonanza, and at an altitude of nearly 12,000 feet. The lake lies in a basin among the sharp crags of the snowy Saw-Tooth and in a sheet of perpetual ice. It was discovered by a party of prospectors, and named the Ice lake. The sun seems to have no effect upon it, except in places adjoining the shore. It is simply a great bowl in the hard mountain rock brimful of solid ice, upon which the rays of the sun descend with no power to penetrate.

To Produce Artificial Marble.—Reduce marble dust or white limestone to a very fine powder by grinding and sifting, mix with it intimately about one-fourth its weight of zinc oxide (zinc white) and one-eighth its weight of Portland cement, and mix thoroughly into a thick paste with a sufficient quantity of a hot aqueous solution of waterglass, containing about 40 per cent of the glass. Mold the paste under pressure while warm, and expose the molded form for a week or ten days to warm dry air before finishing.—*Scientific American.*

Cleaning Carpets.—After the dust has been thoroughly beaten out of carpets, and they are tacked down again, they can be brightened very much by scattering cornmeal mixed with coarse salt over them, and then sweeping it all off. Mix salt and meal in equal proportions.

Cleaning Files.—A cotemporary says that files may be readily cleaned of grease by holding them for a moment in a steam jet from a blow off cock.

Good Health.

What is a "Stimulant?"

In reply I would say that any poisonous or unnatural substance ingested into the living body, in amount within the ability of the vital organism to *readily* expel it, or even of the most wholesome food substance in excess of the *needs* of the organism, and yet, again, not so excessive as to depress the vital forces instead of spurring them to increased efforts to thrust it out, is a stimulant. In short, anything of an injurious nature, by reason of quality, amount, or the conditions under which it is administered, may produce stimulating effects. But the inevitable "reaction" of stimulation is depression; although, from natural causes, convalescents often make sufficient progress to overwhelm, or at least obscure, the evidence of the secondary effects.

Speaking with direct reference to the effect of alkaloids in general, Prof. Prescott says: "While a certain portion stimulates the nervous system, a large portion acts as a sedative, so that a difference in quantity of the potion causes a difference in kind of its effects." It should ever be borne in mind that the increased action under stimulation is simply the extra effect forced upon the vital organism to expel an intruder—the intruder being the stimulant itself. If this be the case, it necessarily follows that stimulants deplete, and can never replenish the vital exchequer. Instances have been noted of children who were observed to be unusually active and jubilant prior to an "attack" of diphtheria. In such case—and a true history of every case might establish this as the rule—the diphtheritic poison acts as a stimulant; nature is trying to thrust it out, and all the life forces are abnormally active. We cannot know in how many instances she succeeds in these efforts, nor yet how often her defeats are due to the administration of poisons, and food that for want of digestion becomes a poison, altogether so adding to the toxic condition that nature finally ends an evil she cannot cure. After a vigorous expulsive effort, for example, the system, temporarily quiescent, gathering fresh strength for a renewal of the conflict to dislodge the enemy, or, possibly, having already accomplished the main work, now rests in the stage preceding convalescence—is supposed to require the aid of a stimulant, and food also must be given at frequent intervals "to prevent the patient from sinking;" but, alas, this proves the weight about his neck that carries him to the bottom—"supported" to death. In comparing the stimulation of the vital organism, in sickness, to the spurring up of a tired or lazy animal to greater exertion, there is always this grand difference: The former will every time, and always, exert its entire force—that is, will exert it better, more savingly to life, without than with stimulation. "Self-preservation is the first law of nature," and no other circumstance possible to imagine better illustrates this law than the living organism in sickness.—*Cotton, Wool and Iron.*

Eggs as Food.

Eggs, at average prices, are among the cheapest and most nutritious articles of diet. Like milk, an egg is a complete food in itself, containing everything necessary for the development of a perfect animal, as is manifest from the fact that a chick is formed from it. It seems a mystery how muscles, bones, feathers, and everything that a chicken requires for its perfect development are made from the yolk and white of an egg; but such is the fact, and it shows how complete a food an egg is. It is also easily digested, if not damaged in cooking. Indeed, there is no more concentrated and nourishing food than eggs. The albumen, oil and saline matter are, as in milk, in the right proportion for sustaining animal life. Two or three boiled eggs, with the addition of a slice or two of toast, will make a breakfast sufficient for a man, and good enough for a king.

According to Dr. Edward Smith, in his treatise on "Food," an egg weighing one ounce and three-quarters contains 120 grains of carbon and seventeen and three-quarters grains of nitrogen, or 15.25 per cent of carbon and two per cent of nitrogen. The value of one pound of eggs, as food for sustaining the active forces of the body, is to the value of one pound of lean beef as 1,584 to 900. As a flesh producer, one pound of eggs is about equal to one pound of beef.

A hen may be calculated to consume one bushel of corn yearly, and to lay ten dozen or fifteen pounds of eggs. This is equivalent to saying that three and one-tenth pounds of corn will produce, when fed to a hen, five-sixths of a pound of eggs; but five-sixths of a pound of pork require about five pounds of corn for its production. Taking into account the nutriment in each, and the comparative prices of the two on an average, the pork is about three times as costly a food as the eggs, while it is certainly less healthful. *Boston Journal of Chemistry.*

The Medicinal Value of Vegetables.

On the authority of the *Medical Record*, asparagus is a strong diuretic, and forms part of the cure for rheumatic patients at such health resorts as Aix-les-Bains. Sorrel is cooling, and forms the staple of that *soupe aux herbes* which a French lady will order for herself after a long and tiring journey. Carrots, as containing a quantity of sugar, are avoided by some people, while others complain of them as indigestible. With regard to the latter accusation, it may be remarked, in passing, that it is the yellow core of the carrot that is difficult of digestion; the outer, a red layer, is tender enough.

In Savoy the peasants have recourse to an infusion of carrots as a specific for jaundice. The large sweet onion is very rich in those alkaline elements which counteract the poison of rheumatic gout. If slowly stewed in weak broth and eaten with a little Nepaul pepper, it will be found to be an admirable article of diet for patients of studious or sedentary habits. The stalks of cauliflower have the same sort of value, only too often the stalk of a cauliflower is so ill-boiled and unpalatable that few persons would thank you for proposing to them to make part of their meal consist of so uninviting an article. Turnips, in the same way, are often thought to be indigestible, and better suited for cows and sheep than for delicate people; but here the fault lies with the cook quite as much as with the root. The cook boils the turnips badly, and then pours some butter over it, and the eater of such a dish is sure to be the worst for it. Try a better way. What shall be said about our lettuces? The plant has a slight narcotic action, of which an old French woman, like a French doctor, well knows the value, and when properly cooked, is really very easy of digestion.

Two Cholera Experiments.—If experiments on animals are prohibited, experiments must be made on human beings, and in their rudest form. The contrast between such rude popular experiments on man and scientific experiments on animals was illustrated in a speech of Dr. Lyon Playfair in reference to these two kinds of experiments on cholera. The first experiment was tried on 500,000 human beings in London, who were supplied with water contaminated by choleraic discharges, with the result that 125 out of every 10,000 consumers died from the effects of the experiment. In two other experiments, made by another water company, 189 died in the first experiment, and 130 in the second, out of every 10,000. These popular experiments, on a large scale, involved the sacrifice of half a million human beings. In contrast with this may be taken the scientific experiments made upon animals by Thiersch and others. These experiments were made on fifty-six mice, fourteen of which died from the choleraic diseharges. These were not mixed with water accidentally or carelessly, as in the popular experiment, but were administered under definite conditions, and the effect watched. The results of these experiments showed that water contaminated with choleraic discharges was deadly; the water so contaminated was avoided, and an epidemic was escaped.—*Nature.*

SAN FRANCISCO:
Saturday Morning, Aug. 18, 1883.

TABLE OF CONTENTS.

EDITORIALS.—The Triumph Ore Concentrator; State Mining Exposition; Foundry Notes, 97. Passing Events; Water Level for Underground Use; Magnetic Iron Sands; Arizona Mines; Laying Dust in Mines; Structure of Minerals, 105. Blasting in Mines; Kaolin; Manual of Assaying, 106.
ILLUSTRATIONS.—Triumph Ore Concentrator, 97. Conditions of Disruption in Blasting Rocks, 106.
MECHANICAL PROGRESS.—Steel Hardening; Utilizing Slag Waste; The First American Steel Rails; Metallic Cloth; Magnetic Tool in Mechanical Industry; Imperfect Dynamos; Useful Rule, 99.
SCIENTIFIC PROGRESS.—Flowers and Insects; A New Kind of Gunpowder; Photographic Positives Produced Directly on Paper; A Diffusion Engine; Sense of Direction in Animals; Influence of Electricity on Vegetation; Egypt's Scattered Obelisks; Nickel Crucibles; Velocity of Running Water, 99.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 100.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 100-1.
USEFUL INFORMATION.—Best Time to Cut Timber; How to Remove a Tight Ring; How Some Cooking Wines are Made; Is Rubber Absolutely Waterproof; To Prevent Fading of Goods in Shop Windows; Cleanliness of Sinks; Detecting Leaks in Glass Jars; A Lake of Ice; To Produce Artificial Marble; Cleaning Carpets; Cleaning Files, 103.
GOOD HEALTH.—What is a Stimulant; Eggs as Food; The Medicinal Value of Vegetables; Two Cholera Experiments, 103.
MISCELLANEOUS.—The Carson Footprints; Lava Beds Mines; Mines of San Diego County, 98. The Triennial Conclave; Another Big Hydraulic Pump; The Philadelphia Smelters; Taylor District; Utah Sulphur, 102. Emery's Drill; Midsummer Ice, 103.

BUSINESS ANNOUNCEMENTS.

Machinery—Globe Iron Works, San Francisco.
Ore Concentrators—Joshua Hendy Machine Works, S. F.
Chilled Car Wheels—Steiger & Kerr, S. F.
Land for Sale—Robert Walkinshaw, S. F.
Pacific Business College—San Francisco.
Mechanics' Institute Fair—San Francisco.
Mines Wanted—Mars & Lawver, San Francisco.
Quartz Screens—Book & Wagner, S. F.

Passing Events.

The city is in a state of excitement over "Conclave week," which is the coming one. Yet even now the streets are filled with strangers, Knight Templar emblems are everywhere, flags are flying and the coming holidays are foreshadowed in all we see.

From the mining regions comes little of note other than we give in our mining summary. The season's work is now well advanced in all directions. The principal developments are going on in the Southwest and Northwest, and in the latter part of the country in particular, mining is taking great strides.

FOR the six months ending June 30, the Contention mine produced 13,625 tons ore, yielding $553,086 in bullion. Important improvements are being made at this mine. There has been no ore raised lately, but the mill is running on reserves.

THE Old Dominion Copper company of Arizona has recently purchased the claims of the Long Island company, and a 30-ton smelter. The Old Dominion has yielded 3,702,500 lbs. copper to date.

THE value of the gold and silver deposited at the United States Assay Office at Helena, Montana, for the six months ending June 30th was $246,811 in gold, and $17,048 in silver.

UPWARDS of twenty leads have been located in the Sixteen-mile country, in Meagher county, M. T., within the past two months, and prospecting is progressing lively.

Water Level for Underground Use.

The principle of the water level is of course well known, but an improvement in the construction of the apparatus has recently been made in England, where it has been adopted for leveling drifts and tunnels. One of its main advantages is, that any miner can use it, and the skilled workman with the telescopic level may be dispensed with. An engineer named Charles Bunning has devised the new instrument. It consists of two glass tubes of any convenient length, from 3 to 6 feet each, placed in a wooden upright or staff with a scale of feet, tenths and hundredths, attached, similar to an ordinary leveling staff. Each glass tube is fitted at its lower end in a brass stopcock, from which the tubes are connected by an india rubber pipe of any suitable length, from half a chain to one or more chains. The uprights holding the glass tubes can slide upwards in a frame in order that when leveling on uneven ground, a greater height may be obtained, as in the case of the ordinary leveling staff. For underground use a three-foot upright, sliding up to six feet, has been found useful in low seams, and on the surface, six feet sliding up to twelve feet is the present limit as to size; but size is only a matter of choice. To use the instrument, the india-rubber pipe and half the length of both of the glass tubes must be filled with water, taking care at the same time that no bubbles are allowed to enter, as they might occasion erroneous readings. The two uprights are placed side by side on a level surface, so that when the stopcocks are opened the water will have a full passage to both glass tubes, and will speedily come to rest. This is the only test of accuracy necessary with this instrument.

In the actual operation of leveling, one upright is placed at the starting point, and the other one is sent on in advance; the stopcocks are opened, the level of the water is read upon both uprights, and the results booked, the difference between the readings constituting the difference of level between the two places. This operation is repeated until the distance is completed, when the difference of the total additions of the fore and back sight (or rise and fall) readings will give the difference of level sought for. On leveling up or down hill, one upright will be lengthened to obtain as great a reading as possible in order to get over as much ground as is practicable. Should the instrument be lengthened to 6 feet or 12 feet, so that it would be difficult to read off the level on the index because of the height, all that is necessary is to close the stopcocks, lower the upright, and so fix the reading permanently in the tube for reading off at leisure. The advantages which are claimed for this very simple instrument as compared with the ordinary telescopic level are (1) that it is neither complex nor delicate, and therefore adapted for the rough handling of underground usage; (2) that unlike the telescopic level, no plate screws have to be turned to prepare it for reading, and the use of the water level is so easily learned that it may be placed in the hands of overmen, firemen, or deputies; (3) that the instrument is perfectly accurate, for when once the stopcocks are opened no skill, practice, or experience is required to make the water follow the law of nature and find its own level; (4) that a considerable saving of skilled labor in leveling is thus effected; (5) that it is superior to other levels, in that it can be used round, over or under any obstacle as easily as in a straight line; and (6) that the small cost of the instrument as compared with the telescopic level is a great argument in favor of its adoption.

A new automatic steam brake to prevent overwinding of cages in shafts is in use in England. At a recent trial the engine was set in motion the wrong way. When the cage was pulled up 2 feet 8 inches it came in contact with a lever, which released a lock, and by a simple contrivance instantaneously cut off the steam from the engine, and at the same time allowed it to pass into a steam brake cylinder and applied a powerful brake, which at once arrested the motion of the engine. The whole of the time occupied in winding the cage up, shutting off the steam, lowering the cage on the "keps," and the pit being put in working order again, only occupied about 30 seconds.

SEVERAL gentlemen of Billings, M. T., left one night last week on some secret expedition to some remarkably rich gold discovery recently made by their prospectors. The object of the midnight journey was to dodge some parties who intended to follow them.

Magnetic Iron Sands.

As a general thing mining for gold in the beach sands of the California coast has not been profitable. There have been isolated cases where it has paid well, but taken altogether there has not been much profit for the work expended. It has long been thought it would be profitable to work the beach sands for the iron they contain. The wash of the sea and the whirl of the winds concentrates the heavy magnetic iron in masses, and it is more or less abundant at many points on the ocean beaches. Various attempts have been made to utilize these sands for their iron, but no success has been made of it. Last year there was talk of a company about to make steel direct from the sands, but nothing practical has come of it. Not only in this country, but in Canada, New Zealand and elsewhere, many attempts have been made to get the iron from the sand at economic rates.

Machinery in which magnets are employed is said to have successfully separated the iron, and in Canada one got by this process an iron sand with 72 per cent metallic iron. Now comes a New Jersey man who has invented a method of making bar iron out of the sand and he is about to introduce the system in Ohehunga, N. Z. The process is as follows: The sand as it is found is brought to a separating machine, where it is separated by magnets. The sand contains, after being cleaned, about 70 per cent pure iron, about 5 per cent impurities, and a little titanium. From the separating machine the sand is put into a furnace 32 feet high and of 7 feet diameter. In the furnace are a number of retorts, into which the sand was introduced and heated red in order to expel the oxygen. From these retorts the iron sand is brought into a common puddling furnace, which is below the retorts, and whose gases are employed for heating the retorts, then here it is worked into ingots. The proprietors of the works are of the opinion that the costs of this process are considerably cheaper than production of pig iron.

Arizona Mines.

We had a conversation this week with Mr. C. H. Aaron, who has just returned from Pinal, Pioneer district, Arizona, and we should judge the region in question was not in a very promising condition. There are some 5,000 locations in the district, but only one paying mine—the Silver King—and that passed its dividend this month. The Eureka mine was considered one of the best properties in the district, and has been purchased by Eastern people. It is now being worked. They have a five-stamp mill known as the "76." The present work will prove the worth of the mine. In a mine close to the Silver King, called the Monarch of the Sea, they have recently struck ore reported to be good. They have been trying to find the King body of ore, but what they have struck is reported to be of a different character.

Another of the mines there, sometimes called the "Bilk," properly the Mowry, sunk 800 feet, but found no ore. They are also looking for the King ore body. It appears to be a characteristic of the mines so far that if they have good ore on top it does not go down.

The Pinal Con. smelting works have stopped work and discharged a lot of men. Some say this is due to lack of ore; others say they will build another furnace and start again.

There are about 600 or 700 men in the district. The Silver King has about 100 men working in the mine and 25 in the mill. Most of the miners are holding their claims to sell, and not much prospecting is being done except on claims already discovered.

The little smelting furnace put up in Rogers district was a failure, partly for the reason that mule power did not answer for blowing. A small engine is to be put up for the blowers. The furnace—an adobe—was too small, also.

The Hastings mine, at Queen creek, has a splendid gold mill. They stopped work some months since just as the mine began to pay, but are now resuming operations.

Mr. Aaron thinks highly of the future prospects of Arizona. He considers it much superior to Nevada both as a mining and agricultural country.

INFORMATION WANTED of the whereabouts of A. Morrison, formerly of Rye Patch, Nevada. Address this office.

Laying Dust in Mines.

It is very well known that impalpable molecules of flour, a substance not inflammable of itself, give rise to spontaneous combustion, and many persons believe that the chief cause of colliery explosions must be sought, not in the spontaneous production of carburetted hydrogen, but in the minute particles of coal dust which penetrate the gauze of the safety lamp become incandescent and throw off sparks outside the lamp, thus igniting the fire-damp. It is now suggested as a means of prevention to employ jets of steam, which, owing to their expansion, would penetrate into all corners of the mine and deposit the dust. Nothing is said of the effect of this steam on the miners.

A professor of the Royal Athenaeum, Antwerp, suggests a method of applying this steam. The steam pipe for laying the dust, which need only be the diameter of the little finger, is to be put in communication with the boiler on the surface, and there provided with a stop-cock as well as at the working face, and telegraphic communication is to be established between these two points, in order that the quantity and pressure may be regulated from time to time, according to requirements. A pipe of one centimeter (less than one-half inch) in diameter would give enough steam for an ordinary working place, because a given volume of water, turned into steam at atmospheric pressure, expands 1,700 times; and this steam, when allowed to escape freely into the air, would become further expanded by 100 times, so that it would fill a space of 100 cubic meters (3,530 cubic feet), and in condensing lay the impalpable dust. It would also moisten the atmosphere, and probably separate the carburetted hydrogen into its component parts, thus rendering it less inflammable, and so prevent an explosion. M. Spanogbe's experiments are not complete as to this portion of the subject; but he argues that, inasmuch as the combustion of lighting gas is not so perfect during foggy weather as it is when the atmosphere is free from moisture, the pressure of steam in the air of the mine must certainly exert a favorable influence in preventing fire-damp explosions.

Structure of Minerals.

Properly speaking, the cleavage of crystals is part of their structure. The chief varieties of structure as distinct from cleavage, are called:

Fibrous.—Made up of thin, straight, or curved fibers lying side by side. They have often a silky luster. Satin spar is a name given to fibrous varieties of gypsum and aragonite, in which this silky luster is very marked.

Reticulate.—The same as fibrous, but the fibers crossing each other irregularly in all directions, as in the mineral called mountain leather.

Stellate.—The fibers radiating from centers in all directions, as in stilbite and some varieties of gypsum.

Radiate or Divergent.—The fibers diverging from each other, but not producing complete stars, as in antimonite and pyrolusite.

Lamellar.—The mineral appearing to consist of flattened leaves or lamina, as in bronzite. The lamina may be either flat or curved.

Foliaceous or Micaceous.—The leaves being very thin, as in mica and selenite.

Granular.—Apparently made up of minute grains, as in chalk or kaoliu.

PROSPECTORS returned from the Quijotoa mountains, Arizona, are very enthusiastic over a rich strike there. The owners are taking ore from the surface to ship to Benson, and the mine has every appearance of being one of the largest and richest in the Territory.

THE owners of the Grand Central mine in Arizona expended $400,000 before getting back a dollar. There is said to be 20 miles of underground to work in this mine. It is yielding from 95 to 100 tons of ore daily, and a 35-stamp mill is in constant operation.

HORSE-POWER HOIST.—The types made us say recently that the Baker horse-power hoist would raise a loaded cage twelve feet per minute, when it should have read 120 feet per minute.

THE lead in the Green mine, Tuolumne county, pinched out or was lost awhile, but last week, by changing direction of work, it came in again, and is yielding very rich ore.

THE completion of the tunnel will add considerably to the life of the Ontario mine.

Blasting in Mines—No. 4.

Conditions of Disruption.

The conditions under which disruption of rock may take place should be carefully considered. Suppose a block of unfissured rock detached on all sides, as shown in plan, Fig. 1, and a bore hole placed in the center of this block? If a charge be fired in this position, the lines of rupture will radiate from the center towards every two, or towards all four of the unsupported faces of block, because the forces developed will act equally in all directions, and the lines of rupture will be those of least resistance.

Evidently this is the most favorable condition possible for the charge, since the rock offers an unsupported face on every side, and it is evident that the line of rupture must reach an unsupported face to allow of dislodgment taking place. Suppose again, as shown in Fig. 2, the block to be unsupported on these sides only, and the charge placed at *h*. In this case, the lines of rupture may run to any two, or to all three of the unsupported faces; and hence this will be the next most favorable condition for the action of the charge. The greatest useful effect, however, will be obtained in this case by placing the charge further back at *h'*, when the lines of rupture must necessarily run to the opposite faces, *b c*, and consequently the whole of the block will be dislodged.

Assume another case, says Andre in his "Coal in which the rock is unsupported only on two sides, as shown in Fig. 3, and the charge Mining," from which these engravings are taken, placed at *h*. In this case the lines of rupture must run to each of the unsupported faces, *a b*. Thus it is evident that this condition, though still a favorable one for the good effect of the charge is inferior to the preceding.

As rock is never homogenous in composition or uniform in texture, its lines of rupture, which, as before remarked, will be those of least resistance, many reach the faces at any point as at *m*, *n*, *m' n'*, or any point intermediate between these. But it will be seen that the useful effort will be greatest when these lines, radiating from the charge, make an angle with each other of 180 degrees, or in other words, run in directly contrary directions, and that the useful effect diminishes with the angle made by these lines of rupture.

Suppose again the rock to be unsupported upon one side only, as shown in Fig. 4, and the charge placed at *h*. In this case the lines of rupture must run to the face *a*, and the condition must therefore be considered an unfavorable one.

As in the preceding case, the useful effect will depend upon the angle made by the lines of rupture, *h m* and *h n*, which angle may be very small, and which must necessarily be much less than 180°. A greater effect may be obtained under this condition by firing several charges simultaneously. If, for example, we have two charges placed, one at *h* and the other at h', and fired successively, the lines of rupture will run in or near the directions, *h, m, h, n, h' m', h' n'*, and the portion of rock dislodged will be *m h n h' n'*. But if these two charges be fired simultaneously, the lines of rupture will be *hm, ho, h'o, h'p'*, and the mass of rock dislodged will be *m h h' n'*.

Simultaneous firing is in this way productive of a greatly increased useful effect in numerous cases, and the mining engineer and quarry man especially will do well to direct their attention to this source of economy.

There is yet another care to be considered, in which the conditions are still more unfavorable. Suppose two unsupported faces at right angles to each other, and the charge placed at *h*, as shown in Fig. 5. In this case the lines of rupture will run to the two unsupported faces; but as these lines must necessarily make a very small angle with each other—for the length of the lines increase rapidly with the angle—the useful effect will be less than in the last case. It follows, therefore, that this is the most unfavorable condition possible, and should be avoided in practice.

In the foregoing considerations the holes have been assumed to be vertical, and for this reason the unsupported face which is perpendicular to the hole, that is, the face into which the hole is bored, has been neglected. For it is evident that, under the conditions assumed, the lines of rupture cannot reach this face, which therefore has practically no existence. Suppose, for example, a bore hole placed at *h*, in Fig. 6, and the rock to be supported at every side except that at right angles to the hole. The forces acting perpendicularly to the direction of the bore hole are opposed on all sides by an infinite resistance, and consequently the line of the hole becomes that of least resistance. Hence in this case either the tamping will be blown out, or if the forces developed are unequal to the work, no effect will be produced beyond a mere enlargement of the hole at the base.

This is a case of frequent occurrence in practice, and it becomes necessary to adopt measures for making this unsupported face available. Evidently, this object can be attained only by so directing the bore hole that a line perpendicular to it may reach the face—that is, the line of the bore hole must make with the unsupported face an angle less than 90°. The direction of the bore hole is shown in Fig. 7, which may be regarded as a sectional elevation of Fig. 6. In this case the lines of rupture, which will run similarly to those produced in the case shown in Fig. 4, will reach the unsupported face at *b*, and the length of these lines, and consequently the depth of the excavation for a given length of bore hole will depend upon the angle which the latter makes with

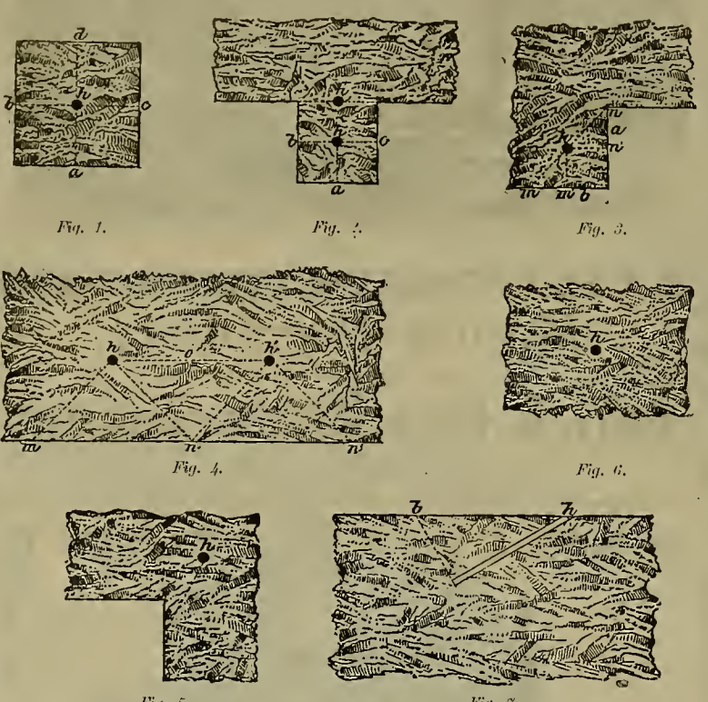

Fig. 1. Fig. 2. Fig. 3.

Fig. 4. Fig. 6.

Fig. 5. Fig. 7.

CONDITIONS OF DISRUPTION IN BLASTING ROCK.

the face. This mode of rendering a single exposed surface available is called "angling the holes," and it is generally resorted to in shaft sinking and driving headings. The conditions involved in "angling" are favorable to the action of strong explosives.

Riverside Raisins in Boston.—California products are constantly winning wider fame. Mr. George H. Tullerton, of Brockton, Mass., on a recent visit to Riverside, purchased samples of raisins made by Messrs. Combs & Cutter, and, taking them East, exhibited them at Boston to wholesale and retail dealers. He reports to the Riverside *Press* that the fruit was received with exclamations of surprise, and then these words:

"I never saw such raisins; were they grown in California?" "Yes, sir, in Riverside," is the reply. "Well, sir, if California can produce such raisins as those, we want them. They are finer than the Malaga." "That is saying a great deal," I reply, and the answer comes: "But, man alive, it's a fact. I'll sell those fancy packed raisins for five dollars a box, any time before New Years, and can get three dollars for such 'London Layers' at any time." One extensive dealer in raisins in Boston has had one of the samples on exhibition at his place of business, and has taken every opportunity to exhibit the raisins to wholesale dealers in the city. They say, "They are the finest raisins that ever came to Boston." Their keeping qualities are found to be superior to the Malaga.

A Guibal ventilating fan 36 feet in diameter with a velocity of 50 strokes a minute, engine 36 inches in diameter, drives 60,000 cubic feet of air a minute down a mining shaft.

Kaolin.

Kaolin, or porcelain clay, is an exceedingly valuable substance, and the miners of this coast have prospected for it more or less for years. They frequently think they have found it, but usually bring in infusorial earth instead. Scarcely a fortnight passes but some miner brings or sends us infusorial earth under the impression that it is kaolin. Specimens of the material are in the State Mining Bureau from Kern and Tuolumne counties, but by far the greater part of the deposits are of the diatomaceous earth character, and not kaolin. The two substances bear a close resemblance apparently, but are very different in their characteristics. Now we are told a large deposit of the pure kaolin has been found in Nevada county, and this week received the following letter on the subject:

Editors Press:—Dated as far back as 1871, I remember articles in your much esteemed Press and paper, and among other noted mining interests of California, looking to the discovery of the much sought for kaolin which you or your contributors supposed might be found in this region.

I have made many searches and researches on this coast for the pure article of kaolin, but not until within a few days have I made the wonderful discovery that it is even within our midst, *pure*. On the grounds of Mr. J. W. De Golia, situated in Grass Valley township, California, I find as good a quality of kaolin as I ever saw in England, where I first worked it and became acquainted with its merits, or in Merwinsville, Connecticut, or Cornwall, Litchfield county, same State, where I put up buildings and mills. From these last mines I worked five tons, which were sent to the Exposition, Paris, France, from this country, and received the premium there in 1865. I do not think they have a better quality of kaolin in the great works at Trenton, New Jersey, where it is supposed the best article in imitation (or better than imitation) of French and China ware is manufactured in this country.

This body of kaolin, in its purity, now exists in large beds upon the grounds of Mr. De Golia, within a half mile of the Nevada City Narrow Gauge railroad, in Nevada county. It has the advantage of carrying with it feldspar, or petunse, which is necessary to the production of clear porcelain.

Correspondence with those manufacturing this article of clear porcelain is desired.

I will state that this is the first pure article of kaolin with its necessary adjuncts for working, and its close connections for transportation, discovered in large quantities on this coast. I have the first United States patent issued for preparing and reducing kaolin for the production of pure, white, clear porcelain.

T. W. Moore.

Gold Flat, Nevada City, Cal., April 11th.

D. O. Mills has formally presented to the Capital Commissioners for the State of California a magnificent piece of statuary representing Columbus at the Court of Queen Isabella. It is nine feet high, and cost $35,000.

The Vatican has sent instructions to bishops in Spain to abstain from sharing in the present political agitation in that country.

Manual of Assaying.

There is a constant demand for a manual of assaying adapted for the use of miners, prospectors, mill men, and such persons as have not the chemical knowledge to undertake the analysis of ores. A simple book is what is needed, and that badly. Mitchell, of course, covers the want, and a great deal more; but the price is very high.

We have received this week a "Manual of Assaying," by Walter Lee Brown, published by Jansen, McClurg & Co., of Chicago. The book is comprised in three divisions. The first describes and illustrates all apparatus required, as sampling and pulverizing implements, balances, furnaces, tools, etc.; it also describes the re-agents, and how to prepare and test them. The whole of the second part is devoted to the assaying of the ores of the four metals mentioned, but principally to those of gold and silver. The third part, or appendix, includes many special processes, as the assay of gold and base bullion, amalgamation, pan and chlorination tests, copper analysis, testing of minerals, etc. For reference, there are here included lists of the minerals of gold, silver, copper and lead, a list of books bearing on geology, mineralogy, metallurgy, assaying, etc., and various useful tables of weights.

The book is intended as a simple, practical one, to contain all information necessary to enable any one, with a little practice, to assay ores that are supposed to contain gold, silver, copper, or lead. Mr. Brown is an analytical chemist and assayer, and has given the mining community a really useful little book—costing but $1.75—yet there are some defects. For this coast, too little account is given of the crucible assay, which is more used than scorification. What is given conveys the impression that the writer knows but little of it. References and quotations are quite too frequent, as if the author did not feel sufficient confidence in himself to give facts on his own responsibility. The quotations on page 155, credited to Ricketts, belong to Mitchell, from whom evidently Ricketts took them, for they are verbatim.

No man, unacquainted with the operation, could make an assay of gold by chlorination from the direction given in this book. The author gives a determination of the "reducing power of certain ores," but says nothing about the oxidizing power of certain other ores, which has puzzled many a student. This defect is in all the books. The utility of the table of assay ton equivalents is not very clear. The list of books on subjects more or less connected with assaying is a useful one. The description of the apparatus used in assaying is good and clear. The illustrations are well executed also. The author has faithfully endeavored to carry out his idea of a plain, practical work. On the whole, the book does not quite fill the bill of a hand-book of assaying gold, silver, lead and copper in the most satisfactory manner, yet it is the best attempt at a simple book on the subject for the use of the class it is intended for we have yet seen. No one will be a loser who possesses it, if he is at all interested in the subject. It contains 318 pages, and is fully illustrated.

Long Tom District.—This district is in Kern county, in this State, about thirty miles northward and westward from Bakersfield. Mr. Aaron, who lately visited the district, informs us that the Long Tom mine, which has been worked many years, is just at present short of ore, and the working force has been reduced. All the gulches in the vicinity were long since worked out, and many quartz veins are being prospected in the vicinity, and many of them promise very well. On the hills about they occasionally find pieces of gold of considerable value, indicating rich deposits near by. Of course the miners are trying to find the original deposit.

The German government will send a scientific expedition to Egypt to examine into the origin, nature and cause of the cholera now prevailing there, and to ascertain the best measures to prevent the spread of the disease.

The new steamer *Mariposa* has just made the quickest trip on record between Honolulu and San Francisco. She was five days twenty hours going down, and six days eight and one-half hours returning.

Los Angeles is to have a free postal delivery from the first of October next.

Metallurgy and Ores.

Nevada Metallurgical Works,

No. 23 STEVENSON STREET.

Near First and Market Streets, S. F.

ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores Worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, Etc.
Working Tests (Practical) Made.
Plans and Specifications furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO,
(Formerly Huhn & Luckhardt.)

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER.

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens exclusively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

82 Fremont Street, San Francieco.

THE MOREY & SPERRY MINING MACHINERY CO.,

(Successors to MOREY & SPERRY,)

—Manufacturers of all kinds of—

Mine and Mill Machinery

WAREROOMS: 92 & 94 Liberty St., New York.

WORKS: Newburg, - New York.

The Foundry and Machine Shop having been enlarged we are now prepared to make from the most improved patterns QUARTZ and STAMP MILLS complete, for working GOLD and SILVER ORES.

MOREY'S IMPROVED PULVERIZER,

For WET or DRY Crushing.

SIMPLE, EFFICIENT and DURABLE

The Balls revolve **Horizontally** without friction. 5 ft. size, weight 7,000 lbs., and does more work than 15 Stamps, 3 ft. size, weigh 3,000 lbs.

Concentrating Mills, Rock Breakers, Amalgamating Pans and Separators, Roasting Furnaces, Hoisting and Pumping Machinery, Engines and Boilers, any size required, Hydraulic Giants and Pipe, Ore Cars, Ore Buckets, Safety Cages. The Hard Power Two-stamp Mill weight 250 lbs. THE EUREKA WIRE ROPE TRAMWAYS, Concentrating Riffles for Mills and Hydraulic Sluices.

MOREY'S IMPROVED PULVERIZER.

Steel SHOES and DIES for Stamps, and Mine and Mill Supplies. Agents for IMLAY ORE CONCENTRATOR and the MINERS' HAND ROCK DRILL. Information and Estimates cheerfully given. **Send for Catalogue.**

Address, THE MOREY & SPERRY MINING MACHINERY CO.

ANTI-SCALE COMPOUND

Manufactured by RICKARD & DURDEN.

We guarantee that, with proper use, this Compound will remove and prevent all

INCRUSTATION IN STEAM BOILERS.

Ten years trial, in widely separated localities, has demonstrated the value of this invention, and its applicability to different qualities of water. References cheerfully furnished to any one wishing same.

THE ROLLER ORE FEEDER.

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hill also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 30x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

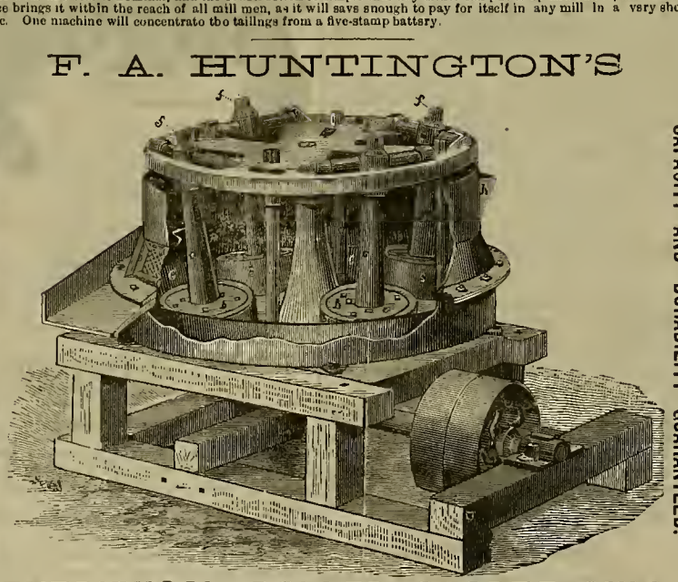
MILL & MINING MACHINERY.

F. .A HUNTINGTON,

No. 45 Fremont Street. - - San Francisco, Cal.

PATTEN'S



CONCENTRATOR

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

F. A. HUNTINGTON'S

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

CAPACITY AND DURABILITY GUARANTEED.

CENTRIFUGAL ROLLER QUARTZ MILL!

After running one of these mills on the Whidden mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing, not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

F. A. HUNTINGTON, ESQ.—DEAR SIR: Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Company's property, at Shingle Springs, El Dorado county, Cal., about four months, and it did good and satisfactory work; a greater portion of gold remaining in the mill than in a stamp battery.

FRED. JONES, Supt.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

CUTTER FOR WOOD-WORKING MACHINES.—A. I. Sanborn, S. F. No. 282,671. Dated Aug. 7, 1883. In the ordinary construction of the cutters to be attached to the revolving cutter-heads of wood-working machines, they are so formed as to be bolted upon the back side of the cutter-head, relative to its direction of revolution, and the cutting edge projects to the front, so as to make what may be termed a "lifting cut." In one case the cutter has been so formed that the cutting edge stands in a lateral, oblique relation with the shank, so as to make the part which cuts deepest the last to cut, but it is fixed to the head in the manner above described. Mr. Sanborn's cutter consists of a steel plate, or series of plates, bent to the shape of the molding, or the parts of it to be cut, these plates being bolted or secured to the cutter-heads so as to project backward from the revolving head. Instead of being bolted upon the back side of the cutter-head, relative to its direction of rotation, so that the cutter projects forward in the usual manner, the cutters are bolted to the front side and the cutting portion projects backward, so that a drawing cut is secured, and the work will be smoother and more perfect.

LIFE PRESERVER.—Constant Leduc, S. F. No. 282,651. Dated Aug. 7, 1883. This invention relates to a new and useful life preserver as an article of manufacture; and it consists of a suitable band, belt, mattress or garment constructed wholly or in part of dried stalks or stems of what is known commonly as "tule." This is a large rush or sedge of the order *Cyperaceæ*, and known scientifically as *Scirpus validus*. It grows in marshy places, and, while found in several parts of the U. S., is particularly abundant in California, where it grows to a great height, and its stems attain considerable diameter. These stems are very pithy, and when dried become light and buoyant, so they are adapted for the purpose of life preservers. They are not of such a loose texture as to become water-soaked and will remain on the surface of the water an indefinite length of time. The abundance, lightness and economy, make this substance useful in place of cork. The inventor patents a new article of manufacture of "a life preserver made of bunches of the dried stalks of tule, each bunch having a central core of light wood."

GLOVE.—Reuben Raymond, S. F. No. 282,667. Dated Aug. 7, 1883. The object of this improvement is to provide a glove in which the longitudinal finger-seams usually found on the front or working side of the glove are thrown to the rear sides of the finger. A further object is to provide for certain novel cross-seams between the under and second fingers, and between the small and middle fingers. The advantages expected from these improvements are economy in cutting, and comfort and strength in the glove. To obtain these ends, the invention consists in a peculiar piece let into the back of the glove, and forming the back-center of the body of the glove, and the back of the second and middle fingers, and novel fourchettes forming the front and sides of the middle and second fingers, and having a lap and point whereby they are stitched to the main body of the glove and form cross-seams between them and the index and small fingers.

SKYLIGHT.—Peter H. Jackson, S. F. No. 282,641. Dated August 7, 1883. This improvement in skylights for lighting purposes consists mainly in a means for making tight joints where the parts meet, and providing against the effects of expansion and contraction, which loosen the joints and make cracks to leak and admit rain or wet. The class of lights to which the invention is shown as applied in the patent, is those in which frames of iron are supported upon curved or arched ribs, these frames having sockets to receive the glass in the usual manner. Mr. Jackson has made a specialty of this class of work, particularly in lighting cellars, basements, sidewalk spaces, etc. Many specimens of his work exist in this city.

CIGAR AND CIGARETTE HOLDER.—Joseph Fletcher, Livermore. No. 281,183. Dated July 31, 1883. This improvement in cigar and cigarette holders consists of a single piece of wire, so bent as to have a spring at one end, and erossing, clasping ends at the other, the extreme points being bent back to form hooks. The object of the invention is to provide a simple device for holding cigars or cigarettes, whether in the hand, or laying on the table; and in the latter case to support the lighted end above the surface of the table.

HASP LOCK.—John C. Boggs, Auburn, Placer Co. No. 282,607. Dated August 7, 1883. This invention relates to a new and useful improvement in that class of hasps that are capable of being extended longitudinally to adapt them to their staples with ease and accuracy, and it consists in pivotiug the lock pin to the sliding portion through a slot in the stationary portion.

PURIFICATION OF ORES BY AIR BLAST.—In the neighborhood of Genolhac there are large quantities of ochreous earth coutaining some threads of galena, but in no instance does the proportion of lead exceed seven per cent. This ore is consequently very poor, but is so abundant that attempts have been made to enrich it by the ordinary processes of washing. These attempts having failed, it occurred to the engineers to try air, which was forced through three superposed metallic cloths, with meshes of four, five and ten millimetres (.157, .197, .394 inches) respectively. The air being thus perfectly divided reaches a rectangular box, at the extremity of which a hopper distributes regularly the dried and pulverized materials which it is desired to classify. The worthless portions being the lightest are easily driven off by the blast, while the leaden particles being heaviest, are carried to the bottom.—*Cotton, Wool and Iron.*

THE best preparation of iron a doctor can prescribe is Brown's Iron Bitters, because it does not injure the teeth as other iron medicines will.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties conuected with the interests specially represeuted in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and exteuding its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

In the Whitehaven (England) collieries which have been worked since 1667, from the "main-baud" workings underground to the lamp-inspecting station is three miles.

AT the Rainbow mill, in Sierra county, last week, for a run of five hours, $5,000 was taken from the plates alone, the battery not being cleaned up.

THE amount of gold bullion deposited at the Denver Assay Office for the six months ending June 30th was 28,115 ounces, valued at $463,900.

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of seations is increased, and there is a better chance to study their actions The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

18th Industrial Exhibition

—AND—

Mechanics' Fair

of San Francisco, 1883,

Will Open at the NEW PAVILION on Larkin, Hayes, Polk & Grove Sts.,

—ON—

TUESDAY.....SEPTEMBER 11th

And Continue until October 13th.

This will be the most comprehensive Exposition yet held in this State of

Manufactures, Art and Natural Products.

A GRAND CONCERT

And other extra attractions each afternoon and evening.

PREMIUMS.

A liberal list of Premiums, consisting of Gold, Silver, and Bronze Medals, Diplomas, and Cash, will be awarded to meritorious exhibits.

Members of the Mechanics' Institute, in good standing, are entitled to double and single season tickets at half rates.

Intending exhibitors should lose no time in applying for space.

Full information will be given and sent on application to the Secretary, 31 Post Street.

P. B. CORNWALL, President.

J. H. CULVER, Secretary.

FOR SALE

By J. M. LAKENAN, of Grass Valley Foundry, Grass Valley, Cal.

One 20-inch bore engine, 24-inch stroke; one 18-inch bore engine, 40-inch stroke, Meyer's cut-off; one 14-inch bore engine, 36-inch stroke, Meyer's cut-off; two 12-inch bore engines, 30-inch stroke; two sets heavy pumping gear, with bob and connecting rod irons, etc.; 450 feet of 16-inch pump pipe of ½-inch iron, heavy flanges; besides other mining and milling machinery.

For information, address

J. M. LAKENAN,
Grass Valley, Cal.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

Stock and Grain Land.

Parties wishing to purchase good stock raising lands unaffected by severe drouths, will do well to address the undersigned. The lands can be purchased cheap, in lots from 100 to 2,000 acres. It is partly low table and rolling land, partly clear and level. Good for vine and fruit raising. Will raise vegetables and all kinds of grain. Crops certain every year. Near town and a $10,000 public school house. Price, $3 to $5 per acre. Good local market for fruit, vegetables, grain, poultry and dairy produce. Address the proprietor,

EDWARD FRISBIE,
Anderson, Shasta Co., Cal.

MINES WANTED.

Two California Quartz Gold Mines for customers. Must be sufficiently developed to show value, and submitted with reports and 90-day bond.

MARS & LAWVER,
45 Merchants' Exchange, San Francisco.

Mining Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

San Francisco, August 2, 1883.

At a meeting of the Board of Directors of the above named company held this day, Dividend No. 57, of twenty-five cents (25c.) per share, was declared, payable MONDAY, Aug. 13, 1883, at the Farmers' Loan and Trust Company, in New York, or at the office in this city.

WILLIAM WILLIS, Secretary.

OFFICE—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, Cal.

ASSESSMENT NOTICE.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California; location of works, Drytown, Amador county, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 31st day of July, 1883, an assessment (No. 9) of eight cents (8c.) per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, 528 California St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of September, 1883, will be delinquent and advertised for sale, at public auction, and unless payment is made before, will be sold on Thursday, the 27th day of September, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. A. MARTIN, Secretary.

OFFICE—Room 6, 528 California Street, San Francisco, California.

Current Frauds.

The Sophomores of the Michigan Agricultural College continue their useful work in analyzing materials offered to the public under specious names and with wonderful claims—materials which are often worth but one-tenth of the price asked for them, and consequently bring much ill-gotten gain to those who manufacture them. It will be a public benefit to have all such nostrums stripped of their false colors, and the public robbery stopped. In the last issue of the *College Speculum*, Prof. Kedzie gives a group of the results which his students obtained by analysis. We quote as follows:

ROUGH ON RATS.—"Rough on Rats.—Poison. Do not die in the house. Made only by E. S. Wells, chemist, Jersey City, N. J. Is entirely new, differing from anything before introduced. 'Traps, arsenic, strychnine, phosphorous, and other pastes and poisons fail to completely clear them out,'" etc.

This is simply white oxide of arsenic, or old-fashioned "ratsbane," colored with a little lamp-black. It is contrary to the law in Michigan to sell this material without distinctly labeling it *arsenic*. Cost of a box 1½ cents; price 25 cents.

INSTANTANEOUS HAIR DYE.

Chloride of silver dissolved in ammonia water. Cost 5 cents; price 50 cents.

BAZIN'S DEPILATORY POWDER, for removing superfluous hair.

Four-fifths sulphide of calcium and one-fifth red sulphide of arsenic. (Realgar.) Costs 10 cents; price 50 cents.

ORIENTAL CHARM, or magical beautifier, by T. Felix Gourand, New York.

One ounce calomel in eight ounces of water. Cost 10 cents; price $1.50.

CREAM OF ROSES, by H. C. Foreman, Chicago, Illinois.

One ounce carbonate of lead in six ounces perfumed water, with a small vial of red ink. Cost 10 cents; price 75 cents.

CHAMPLIN'S LIQUID PEARL.

Half ounce of oxychloride of bismuth in four ounces perfumed water. Cost 12 cents; price 50 cents.

CAMILLE'S SNOW DROP.

Chalk and carbonate of bismuth. Cost 5 cents; price 25 cents.

MRS. ALLEN'S HAIR RESTORER.

One ounce precipitated sulphur suspended in rose water. Cost 10 cents; price $1.50

A NEW DEPARTURE OF $0.25 for 39 cents, by J. D. Henry, Buffalo, N. Y.

Five small packages (of about ten grains each) of aniline colors. Cost ½ cent; price 39 cents.

DYKE'S BEARD ELIXIR, from U. B. and N. Co. Palatine, Ill.

One-quarter ounce of flowers of sulphur, a few grains of borax, a few grains of powdered cardamom seeds and cinnamon bark, and a small quantity of coloring matter. Cost 1 cent; price 25 cents.

News in Brief.

IT IS said Cetewayo is now on his way to Pietermaritzburg.

THE Nile is rising rapidly, and the destruction of the crops in Egypt is feared.

THE combined weight of six large watermelons sold at Los Angeles last week was 453 pounds.

THE Mayor has counted the cash in the San Francisco treasury, and found it all right—$730,109.35.

THE Mexican Central railroad is now completed 168 miles south of Chihuahua, making a total of 388 miles completed.

RETURNS from seventy out of eighty-eight counties in Ohio show that the Scott liquor law has realized in taxes $1,494,200, and closed 1,900 saloons.

AN English doctor, experienced in cholera epidemics, reports the disease now prevalent in Egypt as of a distinctly different character from Asiatic cholera.

A DISPATCH received at the Indian office at Washington announces that the great Indian trouble in Indian Territory has been settled in a manner satisfactory to all parties, and peace is henceforth assured.

ON THURSDAY, at daylight, the dividing rock was broken through in the Mullen tunnel, on the Northern Pacific, and engineer J. T. Dodge made the passage through the mountain. Forty-five miles of main line remain to be completed.

A FRIEND to the rich and poor. A medicine that strengthens and heals, is Brown's Iron Bitters.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for so many years, the firm name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is now and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That is this understood and appreciated is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year

Oh, My Back!

That's a common expression and has a world of meaning. How much suffering is summed up in it.

The singular thing about it is, that pain in the back is occasioned by so many things. May be caused by kidney disease, liver complaint, consumption, cold, rheumatism, dyspepsia, overwork, nervous debility, &c.

Whatever the cause, don't neglect it. Something is wrong and needs prompt attention. No medicine has yet been discovered that will so quickly and surely cure such diseases as BROWN'S IRON BITTERS, and it does this by commencing at the foundation, and making the blood pure and rich.

Wm. P. Marshall, of Logansport, Indiana, writes: "My wife has for many years been troubled from pain in her back and general debility incident to her sex. She has taken one bottle of Brown's Iron Bitters, and I can truthfully say that she has been so much benefited that she pronounces it the only remedy of many medicines she has tried."

Leading physicians and clergymen use and recommend BROWN'S IRON BITTERS. It has cured others suffering as you are, and it will cure you.

Redlands.

The most delightfully situated colony in Southern California.

Remarkably healthy, being 2,000 feet above the sea level.

Wholly devoted to fruit culture, and especially adapted to oranges and raisins.

Advantages of church, school, store, depot, hotel, stage line, telegraph and telephone.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

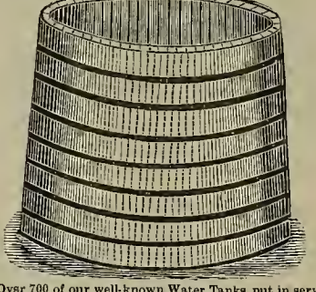
WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.



MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

Mining Machinery Depot,

PARKE & LACY,

21 and 23 Fremont Street. S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air sheet covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.

EXCELSIOR BLASTING POWDER,

Manufactured by the

EXCELSIOR POWDER COMPANY.

—o—

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro-Glycerine Powder, as safe to use and handle as any other Nitro-Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

IRON CASTINGS OF ALL DESCRIPTIONS.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

VULCAN B B,

Black Glazed Powder,

In kegs and cases. The Best Low Grade Explosive in the market. Contains no Nitro Glycerine. Superior to Judson or any Black Powder made.

Is Unequaled for Bank Blasting & Railroad Work.

—o—

VULCAN NOS. 1, 2 AND 3,

The Strongest, Most Uniform and best Nitro Glycerine Powder manufactured, at which we are prepared to furnish at very lowest prices.

Caps and Fuse of all Grades at Bottom Rates.

The Nichols Furnace.

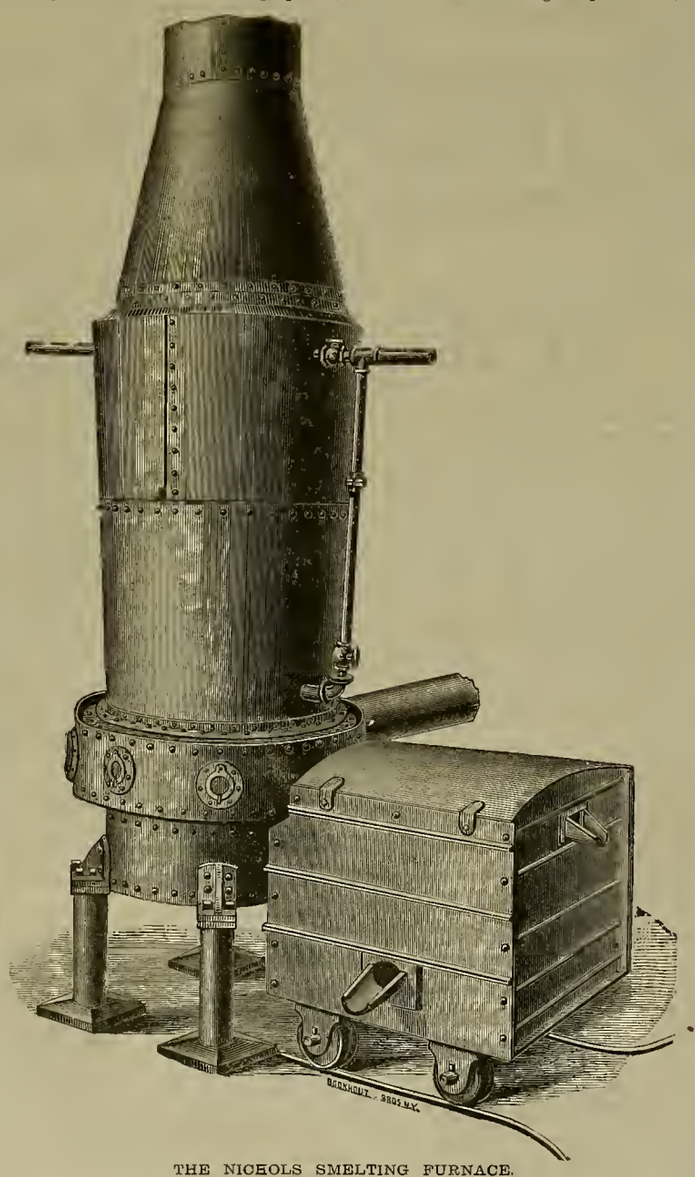
The essential improvement in this furnace is in the use of a removable outside well or hearth, into which flow both slag and metal as fast as smelted. The use of an outside well is not new, but the novelty and improvement consist in the method of making an immediate connection between well and furnace, which allows of a change of the former in a few minutes, should cutting or chilling render such necessary.

Near the bottom of the furnace is an opening 7"x6", the circle of the furnace being flattened at this point to allow of close contact with the water-jacket face of the well. The face of the well is formed by two square frames of wrought iron, covered by soft sheet steel or boiler iron, in such manner as to leave a water space between, and the smaller inner frame corresponding in size and height to the opening in the furnace. The well itself is built of ribbed cast plates, bolted together, lined with fire-brick and mineral wood to prevent chilling, and mounted on wheels, with a flat arched brick lined cover. Near the top, on the side away from the furnace, is a regular slag spout, and below on one side a tap-hole and spout for the metal, which can be tapped at intervals; or, in case of lead, a small outside dipping-well can be bolted on, as usual, on the furnace itself. The well is guided to its place against the furnace by the two outside rails, as shown in cut.

The connection is simply made by running the jacketed face of the well against the corresponding hole in the furnace, attaching rubber hose connections to the water supply pipes, and then letting blast on to furnace. Any slag which might naturally leak between the two faces is immediately chilled and forms a perfectly tight packing between them.

The advantages claimed in practice for this arrangement are as follows: The removal away from the furnace itself of all brickwork which can be cut by the slag, so that repairs can be made without hindrance to the smelting operation. The discharge of the whole product of the furnace is through the opening in the water-jacket itself, which is practically indestructible. The discharge into well, being below the level of slag issue from same, prevents all escape of fumes and keeps the contents of well uniformly hot. The discharge of slag, being at a lower point than usual in furnaces, exerts a favorable influence on the uniform working of the charges.

Three different sizes of furnaces have been in use for a year at the Laurel Hill Chemical Works, Laurel Hill, Long Island. The material smelted is a roasted pyritous ore containing between 3 and 4 per cent of copper, and the fuel employed is common gas coke. An ordinary water jacket furnace was at first employed, but the frequent stoppages and repairs gave rise to a series of experiments which have resulted in the adoption of the present improvement, and no difficulty is now experienced in continuous running.



The improvement has been covered by letters patent granted to Messrs. Nichols & Horreshoff, and can be applied to all kinds of furnaces, square or circular, water-jacket or brick-work. Messrs. Fraser & Chalmers, manufacturers of mining machinery, Chicago, have arranged with Messrs. Nichols & Co. to manufacture their improvements in combination with their various patterns of water-jacket furnaces, and recommend the addition to the attention of lead and copper smelters.

Copper.

Until within the past few years the miners of this coast took very little interest in the subject of copper mining. With poor transportation facilities, lack of knowledge of smelting, and an experience somewhat discouraging as to results, there was a poor outlook for this kind of mining. The success of a few properties, however, has encouraged the owners of others, and the business is rapidly growing. A couple of years ago the Pacific coast was not considered in connection with copper production, but now the copper from here makes quite a figure in the statistics for the year.

As England is the great copper market of the world, some statistics of the trade there will be of interest to our copper miners.

James Lewis & Son, of Liverpool, report a steady trade in copper for the month, and quote the value of Chili bars at £63 10s; ores of twenty-five per cent are 12s. 3d. to 12s. 6d., and regulus 13s. per unit. From statistics they give, an increase is shown in the supplies of copper for England and France, and also an increase in English and French consumption and English export of 4,922 tons, or a difference of 2,444 tons; whereas last year there was a decrease in the stocks during this period of 1,417 tons; this year there has been an increase of 1,027 tons. The Chili exports to July 30th, for the year, are 26,946 tons fine. The stocks of Chili produce are equal to 26,245 tons fine. The total visible supply is 51,913 tons of fine copper, against 49,881 tons on July 1st and 49,667 tons on August 1, 1882.

THE NICHOLS SMELTING FURNACE.

The total amount required for rivers and harbors for the fiscal year will be upward of $35,000,000.

New Ore Feeder.

Wm. E. Wild, of this city, has received a patent through the MINING AND SCIENTIFIC PRESS Patent Agency for an improved ore feeder of peculiar construction. The hopper is divided into two compartments, and its lower end rests on the rear of a tray or hollowed plate, which projects in front of the stand or frame. The forward edge is rounded, and its center is cut out slightly, thus forming an opening at that point and leaving on each side what may be termed lips.

Mounted on the front standard of the frame of the feeder is a shaft on which is keyed a hub having radial arms or paddles. This hub is over the longitudinal center of the tray, and a portion of it fits within the opening of the front wall of the hopper. The arms travel outward, just over the bottom and front opening of the tray. A succession of levers are arranged so that one is struck by the tappet as it falls, and this operates a friction arm or heavy bar, which impinges on a friction pulley. This friction pulley is on the shaft carrying the hub and arms constituting the feeding device. This part of the mechanism is ingeniously arranged, but a description in detail is difficult without engravings. As the tappet moves the levers and rotates the friction wheel, shaft and feed wheel the feeder arms revolve and scrape or push whatever may be in the tray forward over the edge of its opening.

The means for operating the feeder arms are simple and sufficiently positive for the comparatively short movement. By constructing a partition in the hopper in the peculiar manner which his invention does, he claims to prevent all clogging of the ore. The ore works down the sides of the tray and reaches the feeder arms from each side. These, by revolving in the partition, encounter no ore behind them, but only when they move down to and scrape over the bottom of the tray. They are therefore not impeded in their forward movement. The raised side lips of the tray prevent the ore from falling out. If there were no partition in the hopper, and the ore were allowed to gravitate to the tray over its entire surface, the arms could not revolve, but would bind against the mass from the rear, which would soon clog in the throat. In this feeder, however, the ore falls into the tray from each side, and it does not interfere with the arms, as these are protected within a partition.

Two miles north from Bonanza City is a thirty stamp mill, run by 118-horse power Harris-Corliss engine; three 54-inch boilers, 16 feet long, 8 pans, and 4 settlers. The Gen. Custer mine and Unknown are owned by the same company. The mill was built in 1880, and has been working on Gen. Custer ore continually up to the present, but is now clearing up, and will start working ore from the Unknown. The bullion has averaged over $60,000 monthly; 35 tons of ore were worked every twenty-four hours. Chris. Morler is the superintendent of the mill, and Samuel Odgers superintendent of the mines. The mill employs 32 and the mines 36 men.

THE concentrating mill attached to the Little Ellen mine, Leadville, has been burned. Estimated loss, $15,000; fully insured. The mill never was a success. Most of the machinery had been removed.

CORRESPONDENCE.

Arizona Mining.

[From our Traveling Correspondent.]

Around Turkey Creek.

The Con. Bodie mines, incorporated by a New York company, lie on Crook canyon, about twenty miles south of Prescott, two and a half miles below Spence's station. They have heavy smelting silver galena ores, and 400 to 500 tons on the dumps. Ledge matter is from four feet to twelve feet thick. The shafts are 80 and 100 feet deep; a tunnel is 480 feet in on the lead. Lime and iron ore for flux are convenient, and reduction works are expected soon. Some $15,000 have been expended in prospecting the mine.

Good smelting works at this point will be of great advantage to the mines that lie for seven or eight miles above on Crook canyon that formerly "arastrared" the free croppings, but now need a smelter for their changed ores, which are rich.

It is claimed that where the ledge is twelve feet thick forty-one assays were made to test the average value of the ledge, which gave $61 silver and forty per cent lead.

The Wallace, in the same district, has a fine showing of silver ore for the small amount of development made; best assays run over $400 per ton. This is now bonded to Murphy & Co., mining brokers of Prescott, who are handling some fine mining properties. The "Duncle mine," near by, is also promising well as far as developed.

These claims, like a large proportion of the claims of this country, have country rock of granite and slate.

Turkey Creek District

Was organized about 1864, and has always been noted for rich ores, but for various causes has not had any very thorough and extensive works. It has yielded rich ores, and the proceeds have been consumed in expenses of living—making further developments on small prospect scale.

Within the last year some new life is developing, and now scarcely a week passes that one or more countenances are not radiant with the glow of success, as the miner says, "I have strnck it," and at the same time showing the genuine chloride or horn silver, worth sometimes as high as $2,000 per ton.

The Turkey Creek mining company's plant is owned by Chicago and Wisconsin capital; Mr. Paul Lachmond is superintendent. The plant is now nearly completed, and consists of a five-hearth reverberatory furnace, with its castings from Frazer & Chalmers, Chicago, erected by J. B. Brown, who has had extensive experience in the State of Nevada and Arizona during the past twenty years in erecting the various improved furnaces.

The thirty-ton water-jacket furnace is from Rankin & Brayton's Pacific iron works, San Francisco. They also have a sawmill attachment running ont the lumber needed. There are several mines belonging to this company now being developed by a small number of men. Their deepest shaft is 276 feet, and about same length of drifts. They have now 1,400 tons of ore on the dnmp, and a small force opening up drifts in the mines. From all appearances, "Freanor's Camp," as this was formerly called, will soon be turning out its sbare of base bullion. They are well favored with abundance of wood and water. So abundant is the wood that they expect to smelt with charcoal only for a while. They have engaged for smelter Cecil W. Brown, well versed in this branch of metallurgy.

The site and relative situation of mines and works seem well planned. The problem of success is reduced down to the simple equation of "how much ore, and how rich is the ore." But even rich, large veins cannot supply large amounts of ore until considerable cash outlay has prepared the mine for profitable stopings. This is the

Principal Cause for Discouragement and Failure

Here in Arizona. The mill or smelter is erected before the dead work openings are made for the quick and cheap extraction of ores. Then when the large ore yield is wanted, they gonge out all the ore in sight quickly, and soon the mill or smelter must stop for want of ore, though abundance of it is in the mine.

The constituents a long way off, who had been assured there were millions of tons of ore there very easily mined, now get scared and tie a hard knot on their purse and refuse another dollar. "If that $100,000 purchase and plant can't pay its way now it can go, or stop right still for a while." This is what has been said and acted many times. And true and honest miners who sold the mines, and the trusted and able expert who reported only the solid facts as he thought he saw them, have been condemned, often very wrongfully, and the mine and plant pronounced a failure, when nothing was lacking but the proper opening for the practical working basis of the mine.

"A Case in Point."

A Boston and Rhode Island Company bought a mine in the State of Nevada for $120,000, after having full privilege of taking out tons of the ore and getting it reduced where they chose and taking all the samples for assays they thought proper to take the advice of the best practical experts and every precantion to ensure safety on their part. The bargain was closed and $20,000 only was advanced and a mortgage for the balance of $100,000 was given on mill of 20 stamps, already erected by the purchasers, to the sellers of the mine as security till paid. The cash $20,000 was paid over in Boston and the mortgage properly executed and full possession given the purchasers, and their superintendent sent on to take charge of the new mining enterprise. The honest miner who sold, intrusted this mortgage to the superintendent's care to have it placed on record in Nye county, Nevada, and supposed it was all properly recorded. But what was the astonishment of two honest and honorable miners when they found out a year subsequently that their mortgage had never been put on record, but that the Bank of California held a mortgage on the property for $30,000 with interest, and that the mine was worked out of the available rock in sight and now thrown up as worthless to get clear of completing the payment, and the honest men who showed them a mine with pay ore for more than 100 feet in the tunnel, was now defrauded entirely of their property.

The Bank of California sold the mill and it was moved. The laborers by early suits and attachments succeeded in getting a portion of their wages. Eventually by U. S. law the mine was subject to relocation at a certain date, and who should arrive there at day dawn but this same Lieutenant and former superintendent, eager to locate that same property that he had defrauded from both his constituents and the pioneer locators of its possession. But the Lieutenant found himself distanced by a youth who had slept on that spot over night expressly to be there at the earliest hour of our civil and legal day.

He located this mine that had been reported back as worthless to the honest stockholders at Boston, with a strong implication of fraud on those who had sold it to them. This same mine has since sold for cash all in one check for $672,000 (if memory makes no mistake in the exact figures).

No doubt some frauds have been perpetrated by the sellers of mines, but by far the greater cause of disappointment to stockholders comes from an inefficient handling of the mine after the purchase, and not appreciating fully the cash necessary to place a mine on a producing basis, or so open it that stopings can be speedily and profitably removed.

From the Turkey Creek company's works you can pass by trail over a high dividing ridge to the old Goodwin mine, one of the mines belonging to the

"Nonsuch Mining Company"

Of Philadelphia, and was named after the first Territorial Governor. This is a Pennsylvania corporation, the headquarters being in Philadelphia. Joseph G. Henszey is president, and Samnel A. Henszey is general manager, in charge of the plant. The property of the company consists of 2,400 lineal feet on the famous Goodwin lode, in Turkey Creek mining district, about three miles from the town of Goodwin (Buena Postoffice). The property has npon it openings aggregating considerably in excess of 700 feet. The principal development consists of a main working shaft, of slight incline, 187 feet in depth, which is connected by level with another shaft 125 feet deep, while some distance south from the latter is another shaft 120 feet deep. This mine not only bears evidence of greater development than any other property in the district, but can also boast of greater bullion shipment. Inaccessibility of the record of former owners renders a statement of bullion output impossible, but the character of ore now being extracted justifies the assertion of its earlier product. The present owners have had possession but a trifle over a year, during which time they have pursued a systematic course of opening the mine without drawing upon ore reserves. They are now commencing to take out ore, and will soon make their first shipment. The character of ore is largely black sulphurets with argentiferous galena, considerable native silver, and more or less ruby silver. The outlook of this property as a permanent bullion producer of large quantity is beyond question favorable. Operations are conducted upon a strictly conservative basis. The entire capital stock is subscribed, paid in and owned by less than a dozen persons, who conduct the affair as a close corporation. They have the improved iron drum whim, with wire cable and safety brakes, which seems in every way very efficient and safe for the present requirement. I found Mr. McCann, a very practical and intelligent miner, in charge of the hoisting apparatus and the mine.

Arizona Con. Mill and Mining Co.

This company, organized under New York laws, have a complete quartz mill and roaster capable of treating fifteen to twenty tons of ore per day. The plant is immediately on Turkey creek in the district of that name, and about twenty-two miles southeast of Prescott, on the regularly traveled stage road. The mill site adjoins the town of Goodwin. The mill having undergone many changes and modifications that were found necessary subsequent to its first completion, is now believed to be in good running order. It is not a stamp mill. The process is at once simple and apparently effective. The ore is delivered upon a platform of equal level with the upper story of the mill building. In this room is a rock crusher, now a "Little Giant," the company being about to commence the erection of a "Blake's Challenge" to secure additional capacity.

Having by means of these crushers been reduced to particles the size of a walnut, the ore is conveyed to the "pulverizer," which, in the present mill, acts in place of the ordinary stamps; this apparatus being upon a lower floor, the process becomes continuous. The ore falls into a hopper, by which means it is fed into a cylindrical vessel about twenty-four inches in diameter; in this two arms make 3,000 revolutions per minute, and coming in contact therewith, the ore, or a very large percentage of it, is reduced to an impalpable powder, and passes out the circumference of the cylinder through small holes in the lining. The pulp is then caught by an elevator and taken to the screens—first a forty, then a sixty mesh.

Process of Amalgamation.

Such portions as pass the latter are ready for amalgamation, for which portion of the reduction, this mill employs two processes. The first, known as the "Forster-Firmin," embodies a principle meriting description. Against a stream of the fine pulp is projected a column of quicksilver by strong steam pressure, almost sufficient to vaporize the mercury. The force of the steam in itself compels amalgamation, but to render the operation more complete, the mass is projected with this great power into a large iron chamber. From this the amalgam falls to a large washer on the floor beneath. In this washer are two heavy iron mullers which further facilitate progress of the operation. At the proper time a chamber attached to the pan—the bottom of which is conical—receives the amalgam, while the watery mass remaining in the washer is drawn into residuary pans and the result worked very closely. The steam power for this mill is furnished by a superior 45 H. P. horizontal engine, which we are assured affords superabundance of power. The machinery appears to have received much attention in every detail, and bears evidence of large expenditure. A trial run of twenty tons free gold ore showed but a trace remaining in the tailings, the assay value of the ore being $56 per ton, which would appear to be a conclusive proof of the efficiency of the mill.

The company have displayed foresight in providing duplicate parts of such portions of machinery as are likely to break. They have also a new engine, not yet erected, a fine circular saw and outfit, a Victor rock drill, besides 600 cords of wood on the mill site.

The principal mine owned by the company is the "Morning Glory," distant from the mill about three miles. It is rich in free gold above water level, and the sulphurets below water level can be worked to profit when reduction works are perfected in the vicinity or transportation for the ore secured. The company have several silver claims adjacent to the mill, but have only prospected them as yet, with excellent showing, however.

The company's president and general manager are the same as the Nonsuch, Mr. Samuel A. Henszey, the manager, having provided himself with quarters adjoining the mill.

Abundance of water and timber constitute two great advantages of this camp, which in view of the recently uncovered bonanzas is likely to assume considerable prominence among the bullion producing camps of the country.

We old Pacific coasters admire the true progressive disposition and courage of our new companies to excel the mills and processes now in use, and with much satisfaction record every claimed success, but only a long and continued trial record will establish a permanent record of success and displace the old line of tried machinery and straight line stamp battery. Improvements are needed, and I hope to see yet even greater advancements than have been made since our gold and silver era began.

B. W. CROWELL.

Prescott, Arizona.

Columbus District, Nevada.

EDITORS PRESS:—Believing that a line from this old and well-known mining center will be acceptable to your many readers, while it may at the same time be the means of calling the attention of strangers and those seeking safe investment in good mining properties to this locality, I take the liberty of writing and forwarding this communication.

The Columbus mining district is situated in the southeastern part of Esmeralda county, Nevada, and tapped by a branch of the Carson and Colorado railroad. It is the home of the Mount Diablo, Lucky Hill, Great Eastern and Columbus Consolidated mines, besides many other first-class locations, and above all, that of the famous old Northern Belle mine, a part of whose history is, that since the first day of May, 1875, she has yielded and shipped bullion of the value of *ten millions* of dollars, has never yet levied an assessment, but, on the contrary, has declared in the neighborhood of seventy-five or eighty dividends, through which she has paid in the aggregate not less than $5,000,000 to the stockholders.

It is strange, but nevertheless true, that for some reason our local paper, the *True Fissure*, in its weekly mining reports, which I notice you copy in full, gives to the stranger, outside of its reports of the doings of the Mount Diablo and Northern Belle, no idea of the mines and mining resources of this district. Hence, more especially, this effort to do something in that direction.

It was the unreserved and universally expressed opinion of the late and much lamented Prof. W. Frank Stewart, geologist and famous mining expert of the Comstock, and of this State and the Pacific coast generally, after his third official visit to and examination of the mines of this district, that in no other part of Nevada, or of the entire coast, so far as he knew, was the mineral belt so extensive or better defined than this, the

Mineral Belt of Columbus District.

And also, that owing to the extent and peculiar manner in which the mineral deposits of this belt were distributed, as manifested by developments in the Northern Belle, Mt. Diablo and other mines, no other district within his knowledge offered so many and favorable inducements for the investment of capital with an almost certainty of the development of an extensive, lasting and paying mine.

In addition to the professor's thorough examination of and familiarity with the mineral wealth of this district, he doubtless also took into consideration the fact that in working the mines of this locality

No Water is Encountered,

Nor is any timbering required—the two most important items considered in the cheap and successful working of mines; also the early history of the district, dated from 1871 to 1873, when Messrs. Sweetapple, Hazeltine & Lewis run their little five-stamp mill at Columbus, and by which and within the dates given they shipped some three millions in bullion, while they realized at the same time, and left the country with—at about the time of the advent of the Northern Belle mill and mining company—a snug little fortune of about $250,000 each. Knowing this, in addition to his knowledge of what the Mt. Diablo and Northern Belle and other mines of the district had done up to 1881, Prof. Stewart hazarded nothing of his reputation in the expression of the opinions aforesaid.

The Lucky Hill, a mine owned and controlled by E. J. (Lucky) Baldwin, of San Francisco, the Columbus Con., owned by Eastern capitalists, and the Great Eastern mine, owned by O'Neil, Turner & Co., old prospectors, are developing rich and extensive bodies of ore which are certain, within a very brief space of time, to make them paying mines, and thus bring them prominently to the front, in connection with the Mt. Diablo and Northern Belle, as paying properties of the district.

And now, sir, in addition to the foregoing, and in the interest of any individual or associated capitalist who may desire or be seeking a good and substantial mining investment, to say nothing of the interest of the old-time prospectors who located and still own it, I particularly desire to call attention to one of the mines before mentioned, to wit:

The Great Eastern,

Which is destined beyond a doubt, should it fall into other hands able to develop its resources, to prove itself a second Northern Belle, and thus enrich whoever may be its fortunate owners. This location is in the very center of the mineral belt. It commences about 600 feet east of the Mt. Diablo location, and consists of 1,500 feet running east and parallel with and about 600 feet north of the Jackson mine. The Great Eastern being the oldest location within ist neighborhood, though not patented, possesses, nevertheless, a perfect, undisputed, clear and unclouded title. At about the center of the claim, and about seventy feet north of the main ledge, an almost perpendicular shaft has been sunk to a depth of 110 feet. It is all the way in a most favorable ledge matter, and at a depth of between sixty and eighty feet cut three mineral veins ranging from eighteen inches to three feet in width, all carrying a low-grade ore. About 500 feet east of this shaft is an incline shaft sunk upon the ledge last summer to a depth of 75 feet, mostly in high-grade ore. With a very little money at the beginning and in proper hands, this mine can undoubtedly be made to pay its way from the start, with every favorable prospect of its developing into a first-class mining property. On behalf of the prospectors and many miners of Candelaria and Columbus mining district, a cordial invitation is hereby extended to strangers visiting the mines of this coast to give us a call and examine our mines for themselves. PIONEER.

Candelaria, Esmeralda county, Nev., August 13, 1883.

ANOTHER BORAX BOILER.—Netherton Bros.' team loaded a boiler for Marrotte & Co., of Columbus, on Monday last. It is fully as large as any of the many which have been shipped to the scene of the borax excitement. It is twenty feet long, six feet in width, and two and one-half feet in depth. Besides this, the wagon was loaded with galvanized iron for the construction of seven tanks and a settler. The manufacture of borax is becoming more and more a factor of the southern part of the county. It is adding new life to the town of Columbus from a business standpoint, and is an encouragement that should not be lost sight of as prominent among the industries of Esmeralda. Though times are dull, this is far from a dead community.—*Candelaria True Fissure.*

YANKTON MINING CLAIM NON-MINERAL.—The acting Secretary of the Interior has affirmed the General Land Office decision denying the application for a patent upon the Yankton mining claim at Carson, Nev., upon the ground that the land is non-mineral.

OLD BRONZE TOOLS.—At Salez, in the Swiss canton of St. Gallen, some 60 bronze hatchets have been dug up from a depth of about 18 feet beneath the surface of the ground. These implements are believed to be about 2,500 years old.

MECHANICAL PROGRESS.

Machine Foundations.

The following article, written by M. Powis Bale, M. E., and published in the *United States Miller*, contains many points of interest, and much information especially valuable to machinists and builders:

The proper fixing on adequate foundations has much to do with the satisfactory performance of wood-working machinery, and in the case of high-speed machines, especially those with a reciprocating motion, the jar or vibration is absorbed in a very considerable degree by the foundations, as well as by the framing of the machine. In the case of machines working on the rotary principle, little difficulty is experienced as regards foundations, the stress being, as a rule, easily absorbed by well-apportioned framing; that is on the assumption that the working parts are all truly balanced and fitted.

In the case of vertical saw frames, it has been attempted to do away with the ordinary masonry foundation by mounting the frame of the machine on an extended cast-iron bed-plate, or in light deal frames, by casting the main framing of the machine in one piece. The extended bed-plate system is not to be recommended, except in cases of necessity, where the foundations are had from the ground being marshy, or from overflow water in tidal rivers, or such like causes, as the vibration is not by any means done away with; by using this form of bed-plate, small deal frames may be made very strong and compact by casting the frame solid; but they are somewhat more difficult to make and repair.

Where much water that cannot easily be got rid of is found, and where it is necessary to put in a deep foundation, especial means must be taken to get, in the first instance, a solid basis. Where the weight to be supported and the vibration to be absorbed are considerable, as in the heaviest class of log-sawing frames, we have found a series of English elm piles to make a durable and satisfactory foundation. The depth they should be driven and the distance apart must depend on the action of the machine, the weight of the load, and the nature of the soil. The tops of the piles should be sawn off level, and sleepers or planks fixed transversely on the top of them. The piles and sleepers should be creosoted. Where the ground is moist only, and much concrete is unnecessary, a good plan is to ram the substratum firm and cover with a layer of broken stone or slag, to about six inches in depth; into this layer pour melted asphalt. This binds together in one solid mass, prevents damp, and gives a good foundation for the subsequent masonry.

The vibration of saw frames is lessened considerably by counterbalancing their reciprocating parts, and by arranging the crank-shaft as near the base of the machine as possible, and a fly-wheel or wheels are found to add considerably to their steadiness in working.

The vibration of a machine may be also considerably lessened by the introduction of a sheet of lead between the base of the machine and the masonry for light machines; on an upper floor a thick sheet of felt may also be used with advantage.

As regards the masonry employed for foundations, stone is the best, and offers a better resistance than brick work, but its cost is somewhat of a bar to its general adoption. A deep bed of concrete, if well laid, will also be found very serviceable. The strength of a stone foundation depends greatly on the quality of the stone employed, and also whether the size and shape of the blocks used are in proportion to the strength of the stone; the mortar, too, used for this purpose should be of the finest quality, and the stones accurately dressed. If the dressing is badly done, and the pressure is unequal and severe, they are liable to fracture. Blocks of stone of long dimensions in proportion to their thickness should never be used, as with heavy machines with a reciprocating motion, with a positive stroke or dead blow, the risk of breakage is considerable. A safe rule is to make the length of the block, say about three times the thickness, and the width one a half times. Great care should be taken that the masonry is accurately leveled, and set as nearly perpendicular to the direction of the stress as possible. The top blocks should be clamped together, and the joints filled in with molten lead, as excessive vibration and stress is in a great measure overcome by the weight and solidity of the foundations; the framing of the machine should be made to combine as far as possible, and made integral with it.

The quality of the work turned out and the longevity of the machine depend also more on the stability of the foundations than is generally imagined. The foundation bolts should pass entirely through the masonry, and either be cemented in their places; or, should they not be cemented, they will be found less liable to work loose by putting a piece of hard wood between the plates and the masonry. Wood-working machines with a reciprocating motion should never be put on an upper floor, except those of the very lightest class. In machines with a rotary motion, and the straining forces acting horizontally to the axis of motion, brick-work or timber foundations are usually sufficient, but for the heaviest class of machines, such as rack-saw benches or planing machines, if the earth is all unsound, concrete or rubble masonry should be used; for heavy log frames, steam mortising machines, etc., ashlar masonry is undoubtedly the best. Any reasonable cost incurred for perfect foundations is soon repaid by increased steadiness in working, and consequently improved quality of output. As a rule, inferior production in machines with a rotary motion is directly traceable to inferior workmanship or design in the machine, loose bearings, weak spindles, improperly sharpened cutters, insufficient feed, or unbalanced cutter blocks; but it cannot be denied that, in the first instance, weak or insecure foundations contribute largely through imperfectly absorbing the vibration, to bring about some of these results, especially in machines with their framings put together in sections. If brick-work foundations are used, the bricks employed should be hard and well burnt, and Portland cement should be used; this is especially necessary in damp situations.

As regards brick foundations for machinery, Mr. Trautwine, who has experimented a good deal with building materials, says on this point, that a rather soft brick will crush under a weight of about 30 to 40 tons per square foot, whilst a first-rate machine pressed brick will require from 300 to 400 tons per square foot. This last is about the crushing limit of the best sandstone, or two-thirds as much as the best granites or roofing slates. But masses of brick-work will crush under much smaller loads than single bricks. In some experiments referred to by this author, small cubical masses only 9 inches on each side, laid in cement, crushed under 27 to 40 tons per square foot; others with piers 9 inches square and 2 feet 4 inches high, in cement, only two days after being built required 44 to 62 tons per square foot to crush them. The same authority, however, is careful to add the statement that cracking and splitting usually commence under about one-half the crushing loads. To be safe, he recommends that the load should not exceed one-eighth or one-tenth the crushing load; so also with stone if bricks are used as foundations. For some kinds of wood working machinery, such as steam mortising machines and saw frames, where there is what we may call a constant punching action going on, we certainly think the dead weight should not exceed about one-sixth the crushing load.

The Properties of Oils.

M. Chevreul found metals to have, in certain cases, a remarkable influence on the oxidation of oils. Recently, the *Times* says, M. Livache has used, in this relation, finely-divided metal—such as is got by precipitation—instead of metallic plates, and the effect is greatly increased. He thus tried lead, copper and tin, and found lead to have the strongest action. If precipitated lead, moistened with oil, be exposed in air, an increase in weight is very soon observed, and this is greater the more siccative—or drying—the oil. With linseed oil, the increase of weight reaches a maximum in thirty-six hours, whereas, exposed alone to air, the oil would take several months to reach this maximum. A solid and elastic product is obtained. With non-drying oils the increase of weight is much less, and takes much longer to be completed. The result in question, M. Livache points out, cannot be attributed to a simple division of the matter, allowing more active circulation of air, for the same experiment made with various other substances in fine division does not result in any like increase of weight; the effect here is merely like that in the case of a thin layer of oil exposed to air. The change in the other case must be attributed to a direct action of the metal. He suggests what industry may derive certain advantages from the facts observed. Thus a rapid method is indicated of distinguishing dry from non-drying oils. Further, the heating of oils might be advantageously replaced by a circulation in contact with air and in the cold state, over iron or fine plates having precipitated metallic lead on their surface. The oils so obtained would be always less colored, and would retain great fluidity, while the objectionable odors and the danger of fire which attend the present mode of treatment would be avoided.—*Cotton and Iron.*

PROPER SIZE OF GRATE-BARS.—In answer to the question, "What are the proper length and size of the grate-bars?" Mr. Edwards, in the "Practical Steam Engineer's Guide," says: "When the furnace is more than four feet long the bars should be put in in two lengths, but if it is four feet or less in length, one bar will suffice, in which case only two bearing bars will be required. When a center bearing bar is used for two lengths, it should be made like a double grate-bar—that is, with an opening or air space in the middle. Grate-bars when hot expand considerably, and, therefore, they should not be put in tight or too close together, but should have both end and side play, otherwise they will bend and twist out of shape and soon be destroyed."

COPPER FOR ROOFING. In speaking of the cost of building materials an architect recently suggested the use of copper instead of galvanized iron or "terne" sheets for roofing purposes. He said that copper costs only about double the price of tin, or iron, for the same area of roof; that it is practically indestructible by time, and that even if the building it covers is pulled down, the roofing material possesses an absolute value. The price of copper has seriously declined within the past year, and if the supply continues to augment much more, the metal will soon be as cheap as tin.

SCIENTIFIC PROGRESS.

The Conservation of Solar Energy.

The June number of the Philosophical Magazine contains an article by E. H. Cook on Siemens' new theory, in which the author proves that CO_2 is distributed uniformly throughout our atmosphere, and concludes that the power of gaseous diffusion is such as to equalize the disproportion of gases which Siemens finds necessary for his hypothesis. Siemens in reply admits the uniform distribution of CO_2 in our atmosphere which is subjected to powerful circulating currents, but does not think that gaseous diffusion can work quickly enough to interfere with his photospheric currents. The effect of the slow action of gaseous diffusion he thinks would be inappreciable upon gaseous currents which arise from solor rotation, which amounts to 4,500 miles an hour.

The metallic vapors in the photosphere are chiefly due to mechanical intermixtures. The metallic vapors thus introduced into the photospheric current will be burnt and projected outward into space, not as a vapor, as supposed by Mr. Cook, but as a metallic dust much denser than the surrounding medium; the larger portion of which will, according to Siemens, return to the sun by virtue of solar gravitation and be dissociated on reaching the gaseous metallic sea underlying the photosphere. Siemens then aims to show that the light metallic vapors will be held in suspension in this metallic ocean in the same way that oxygen and carbonic anhydride are retained in sea water. In regard to Mr. Cook's objection that the preponderance of hydrogen and CO in meteorites is inconsistent with the idea that the meteoric gases have been absorbed in space, Siemens remarks that it is sufficient to know that the meteorites contain all the constituents of our atmosphere except hydrogen, and the latter occurs in our atmosphere combined with oxygen; whereas in space and in the solar photosphere, we have evidence of its separate existence, or in combination with carbon. Mr. Cook's criticism upon the solar fan action is speedily dismissed by Siemens with the imputation that it is not understood by Mr. Cook. It is also pointed out that differences of combustion and richness of gaseous fuel may account for the light of colored stars. In conclusion, Siemens refers to a recent paper by his brother, Dr. Werner Siemens, in which the latter cannot reconcile the nature and cause of the electric potential supposed to exist between the sun and the earth except by the adoption of Sir William Siemens' hypothesis.

Artificial Production.

Chemistry is enabling us to replace animal and vegetable dyes, and to form artificial gems, or creditable imitations. Mineral oils replace animal and vegetable oils for illuminating purposes, and the electric light is treading upon the heels of gas. The expensive outfits for the whale fisheries are comparatively abandoned, whalebone and blubber from the huge marine mammals being less in request. Coral insects may proceed with their submarine constructions unmolested. The sea-tortoise will be pursued less eagerly for its carapace. The ostriches of the desert will be less sought after; and even the great pachyderms of India and Central Africa can be spared to be more usefully employed in extending the march of commerce. Under our enlightened civilization we can now manufacture our own whalebone, coral, tortoise-shell, ivory and feathers, without the need of penetrating into wild jungles and arctic or tropical seas for our supplies. The extinction of whalebone in commerce will not deprive us of our umbrellas, nor the female sex of their parasols and corset backs. Rattans have been converted into wallosin, and horn is shaped into pliable bones, while steel ribs also do duty effectually for baleen. In fact, there is no end to the artificial productions, and the list might be extended indefinitely, including artificial ice, which renders us independent of King Frost; artificial sugar, which we can make from starch or rags; artificial fruit essences; artificial horn, from seaweed; artificial wood, from compressed sawdust or straw; artificial leather, from old scraps of the leather cloth; artificial parchment, from paper chemically treated with sulphuric acid; and, as hides for leather become more in demand, we have come to utilize the formerly neglected skins of alligators, snakes, kangaroos, the porpoise, and other sea mammals and fishes.

PEROXIDE OF HYDROGEN.—Within the past few years peroxide of hydrogen has attracted a good deal of attention and has been successfully employed in bleaching and for other purposes. The question of cost, however, has always been an important item, and it may therefore be of interest to state that a German inventor is now said to have succeeded in preparing economically a product, pure, stable and of constant strength, capable of being easily transported long distances and kept for a long time without losing its bleaching properties. Among other applications of this product, that of the decoloration of animal fibers is the most important, as it does not contain some of the disadvantages of other bleaching agents. For wool and silk it is advisable, before bleaching, to cleanse the materials thoroughly, so as to eliminate all the greasy substances and impurities. For this purpose the inventor recommends a bath consisting of a solution of 5 parts of carbonate of ammonium in 100 parts of water, and after having passed through this the material is to be subjected to soaping and thorough washing with water. The bleaching itself is performed either by immersing the materials in the solution of peroxide of hydrogen, leaving them there at a temperature of from 20 to 30° C., until the decoloration is complete or the materials are impregnated, when they are wrung out and exposed in a room heated to about 20° C., where they are left to dry.

DEEP SEA EXPLORATIONS. It is only a comparatively short time ago that life was supposed to be impossible in the depths of the sea, and that the waters were condemned to obscurity, solitude and immobility. The pressure of the water, the absence of light, the slowness of the renewal of the water, the want of algæ or other vegetable materials, and the experiments of Prof. Edward Forbes upon the diminution of animal life with increasing depth in the Ægean sea, were supposed to prove that life cannot exist at a greater depth than 492 yards. When Captains Ross and Wallich found some animals upon their sounding lines, which had descended to a depth of more than five-eighths of a mile, it was thought that they had either been entangled near the surface, or that they had fallen to the bottom after their death. In 1860 the cable between Sardinia and Algiers was broken, and numerous animals were found upon the gutta-percha insulating surface. M. A. Milne Edwards was consulted upon the subject, and he found conclusive evidence that they had been born and developed at a depth of more than 1,243 miles. These discoveries awakened great interest, and led to the preparation of the steam cutter Travailleur in 1880, for a scientific exploration of the sea depths. The cutter has been employed in each of the three past summers in the Gulf of Gascony, on the shores of the Iberian peninsula, Corsica, Algiers and Morocco, in the Strait of Gibraltar and at the Canary islands, yielding an immense number of animals which were previously unknown, many of which were drawn from depths of more than 3.1 miles.

NITROGEN SELENIDE.—Verneuil has recently sent to the *Bulletin Soc. Chimie* a report of his experiments on the preparation of the selenide of nitrogen which was discovered by the late Professor Wohler in 1859. The Gottingen professor prepared it by saturating selenium perchloride with ammonia gas; but Verneuil finds that the method more recently proposed by Fordos and Gelis for the preparation of nitrogen sulphite yields better results, and he takes 10 grammes of the perchloride and mixes it into a paste with a few drops of carbon disulphide, and the paste is then suspended in a liter of carbon disulphide, in which it is almost insoluble. Into this liquid a current of dry ammonia gas is passed. Flocks of ammonium chloride are precipitated, and the liquid passes from a rose tint to a dark cochineal red color. Finally, the red color disappears and brown flocks are thrown down. The current of gas is continued until the flocks become of a clear orange tint. The liquid is filtered, and the flocks washed with carbon disulphide and dried. On removing the ammonium chloride with water, washing again with carbon disulphide, and drying, the nitrogen selenide is obtained pure in amount equal to 80 per cent of the theoretical yield. It forms an amorphous powder, insoluble in all solvents, having the formula $Se_2 N_2$. When dry it detonates instantly by a shock, being as easily exploded as mercury fulminate, less easily than nitrogen iodide. Potassium hydrate and hydrogen chloride decompose it, producing selenite of potassium and ammonia.

COOLING DWELLINGS IN SUMMER.—Dr. Henry Macauley, of Belfast, has recently made a suggestion which, if followed in tropical countries, will turn the tables on the sun with a vengeance. He suggests that Mouchot's sun engine should be used to pump cold air into dwellings, factories, etc., pointing out that the temperature can in this way be reduced from 100° or more to 60°. He points out that not only will this reduce the temperature especially at night, thus rendering sleep possible, but fresh air will be guaranteed during the day, and the plague of flies and insects would be excluded. The weak point about this arrangement is that it requires ice. We think, however, adds *Nature*, that sooner or later in America, where the heat in summer is more distressing than in any other part of the world, and ice is everywhere, this arrangement, or one like it, is certain to be adopted.

THE ART WHICH PRODUCES A CABBAGE.—At a November meeting of the Philadelphia Academy of Natural Sciences, Mr. Thomas Meehan exhibited a specimen of a cabbage which had, before blossoming, grown to the unusual height of three feet, the spiral coil of the stem, which was to the left, having been thus drawn out without any corresponding increase in the number of leaf scars. The cabbage, in its natural condition, is an insignificant plant without any such head of leaves as makes it of commercial value when cultivated. The desired effect is produced by sowing the seeds of the wild cabbage at a period of the year so late as not to allow the formation of flowers, in which case the vegetative vigor of the plant is expended in the production of the mass of leaves, which become better developed and denser as the process of cultivation continues.

JAMES KEENE, the bear of Wall street, is credited with making $5,000,000 during the past three weeks by the fall in stocks.

Mining Share Market.

The festivities now going on in the city seem to have drawn away what little attention there was being paid to stocks, and the business is very dull. In the mines all has been eventless. During the past week dead work has been the rule all along the Comstock lode. At the Chollar-Norcross-Savage shaft they were delayed by the breaking of a pump rod and bob pin for such a length of time that the water rose to such a height above the 2600 station as to drown the west drift leading out to the Hale and Norcross on that level. Though this accumulation of water will now soon be pumped out, it will leave the 2600 level dirty and hot, and for some days work will be carried on there to a disadvantage.

At the Union Con. mine, during the past week, not much was done on the 3000 level at drifting. The principal work has been the timbering up of the main west drift.

At Gold Hill all mining operations are badly crippled on account of the low stage of water in the Carson river, which prevents the crushing of ore. This trouble will not end till the fall rains set in. Meantime about all that can be done in the mines is exploring and prospecting work.

Bullion Shipments.

Ontario, 15th, $12,328; Horn Silver, 16th, $45,000; Ontario, 16th, $3,947; Hanauer, 16th, $4,300; Stormont, 16th, $2,270; Nevada, 16th, $1,160; Hanauer, 18th, $3,300; Horn Silver, 18th, $12,000; Ontario, 18th, $8,195; Mt. Diablo, 14th, $7,446.

THE PACIFIC BUSINESS COLLEGE.—A conflagration a few days ago destroyed the building in which the Pacific Business College was located, and turned the well-known principals and their many pupils out from their accustomed quarters. The principals, Profs. Chamberlain and Robinson, were, however, (quite equal to the emergency, and, securing temporary rooms at the Synagogue, Mason street, between Post and Geary, they resumed business and instruction with but the loss of a single day. Viewing the institution to-day, actively at work, no one would think it had suffered a whit from the conflagration. It will coutiuue in its present location, probably, until it ean return to its old and delightful quarters opposite Union square Messrs. Chamberlain and Robinson deserve great credit for the vigor and alacrity with which they righted their institution after the disaster, and they should be encouraged and supported by a generous patronage from those who appreciate the practical and business-like education which they give their pupils.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in eirenlating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

JACKSON.—*Ledger*, Aug. 18: Harvey Clark is hauling rock from this mine to the Oneida mill to be crushed. There are about 150 tons on the dump at present. Two or three men are employed underground, in taking out ore.

MAMMOTH.—Everything but water is ready to commence operations. The upper tunnel is in 600 ft. The contractors have just completed a contract of 300 ft, doing the work in just three months. There is yet a distance of 400 ft to be run before getting under the big shaft.

SUTTER CREEK.—All work at the Mahoney mine was suspended on Saturday morning last, owing to the refusal of the employes to work until wages due were paid. By express understanding when work was resumed two or three months ago, the employes were to be paid off regularly every month. The last payday should have been on the 10th. The day passed and they quit in a body. The company is behind about $5,000 on this last deal.

KENNEDY.—*Dispatch*, Aug. 18: The old Kennedy mill has been put in order again, and was started up last Monday, on rock from the mine of A. Pharis, which is located a short distance from the mill.

CONFIDENCE.—The 10-stamp mill recently erected on the Confidence mine, near the Mokelumne river, commenced running five stamps last Thursday on rock from the mine. The rock has every appearance of being unusually rich. The mine is owned by Messrs. Hagerman, Matson & Fleming.

NOTES.—The Amador Con. looks somewhat encouraging. Stringers of quartz coming in the bottom indicate ore. The Iowa is in full blast, but have not yet got off a heat. The Lincoln is still dormant with little hope of reviving.

Calaveras.

WEST POINT.—*Chronicle*, Aug. 18: The mines are booming. New machinery and buildings are being put up. The ores continue rich. Mr. Desmond, of Sandy gulch, has struck a new ledge, extensive and rich. Fischer's large, eight-mule teams are hauling the mill and machinery formerly owned by Mr. Bicknell at Whisky Slide, to the Star of the West mine, where it is being put up. Mr. Haskins informs me that they have got through the hard easing, and that the propects look more favorable.

NEW COMBINATION.—The work of running the incline tunnel at the New Combination mine has been commenced. The incline will be 268 ft in length with a grade of 3 ft to 12 ft. The mine at present is running full handed and the outlook is encouraging.

MARCHAL.—*Mountain Echo*, Aug. 15: We visited the Marchal mine on Monday last, and found everything in first-class order. The machinery runs with the precision of clock-work. The shaft has reached a depth of 185 ft. Capt. Cushing, the superintendent and one of the owners, seems well pleased with the outlook.

El Dorado.

GRIZZLY FLAT.—Placerville *Republican*, Aug. 16: The south extension of the Mt. Pleasant and Melton leads are soon to be thoroughly prospected. At present the Melton and Mount Hope mills are running but half the time owing to the scarcity of water; the latter in daytime and the former at night.

BLAIR GRAVEL CLAIM.—Placerville *Democrat*, Aug. 18: Work at this mine is being vigorously prosecuted, and the prospect is better than ever. All the men in the neighborhood are kept employed, and John Blair, who is devoting his time to the work, tells us that the force will be increased from time to time.

Mariposa.

BANDERITA MINE.—*Gazette*, Aug. 18: The main tunnel striking the vein at right angles is 1,430 feet long. At the head of the tunnel a stope of 160 feet shows a five foot vein, a portion of which is good milling ore. From the head of the tunnel 450 feet westerly, a drift is cut upon the vein. At the end of this drift, stoping is commenced, which is immediately under the old whim shaft 450 ft above. Good ore is taken from this stope. Twenty-five men are engaged at the mine. Good milling ore is rapidly accumulating on the dump and the mill will be started in about two weeks.

Modoc.

HAYDEN HILL.—Reno *Gazette*, Aug. 14: The Adin *Argus* of the 9th says: Messrs. Frank, Lacert & Burgett, who worked the Hayden Gouge, have been troubled for air in their main tunnel. To supply this they commenced sinking a shaft to intersect the tunnel. There was no expectation of striking pay in this shaft, but on Monday last the dirt thrown out looked so encouraging that a horn full was washed. The happy miners discovered that the dirt which they were throwing away was worth from $1,000 to $5,000 per ton. Pay dirt commences at a depth of 35 ft; the vein is 2½ ft in width. On the flat, south of the hill, nothing of value has ever been discovered previous to last Thursday. On that day Driscoll & Stearns struck a 14 inch vein of ore, which prospected from $20 to $80. On the following Saturday they uncovered ore, which will pay $250 per ton. After this last strike business began to get tropical at Hayden hill. Recorder Height was kept busy night and day. On last Monday night claimants with lanterns were staking off claims during the entire night, and what adds fuel to the flame is the fact that two of these, Silvers & Dunn, yesterday struck $60 dirt at a depth of only three ft from the surface. In many of the claims, miners have quit working for wages, preferring to prospect for themselves. We hear that the miners in the Juniper claim are taking out dirt that runs as high as $20 and $14 per pound.

Nevada.

MEADOW LAKE.—*Transcript*, Aug. 17: On our visit last week to those ruins of the good old times, we saw about 50 dilapidated old houses, and met a dozen miners still holding on. W. H. Ware and H. H. Hartley are apparently the principal owners of the mines there. With them we visited the mines known as the Pacific, Knickerbocker, Excelsior, Pittsburg and Empire. In any of these mines are found plenty of free gold specimens, and some show quantities of ore seemingly exhaustless. Mr. Hartley considered the average value of the ores to be from $20 to $25 per ton. He was one of the original locators, and did not expect to give up the ship without his pile. Sixty thousand dollars is his price for his four patented mines. If any system of working the ores could be discovered, the excitement over Meadow Lake would be as great as in her palmy days. The dam built by the South Yuba Canal Co. at the foot of the lake, at a cost of $75,000, is still standing. The mines are 24 miles from Truckee and eight miles south of Webber lake, the wagon road being as good as when first graded.

NEVADA CITY MINE.—A rock breaker has been received for the mill of the Nevada City. The 10 inch plunge pump, heretofore reaching only to the 400 level, is being extended down to the 600, and sinking for the 700 will soon begin. The ledge continues to produce well from the 400 and 600 levels.

BIG CLEAN-UP.—*Herald*, Aug. 14: We learn that a clean-up of $110,000 was recently made in the Manzanita hydraulic mine, at Sweetland, after a run of 41 days. This is an offset to the entire season's crops of half the ranches in the sickens fields.

MURCHIE MINE.—Grass Valley *Union*, Aug. 15: For the past two weeks the old Murchie mine has shown a marked improvement. On the 400 level they have struck a 3-ft ledge which is very heavily charged with sulphurets, and shows considerable free gold. One crushing had from it in 24 hours' run, exclusive of the free gold, yielded 1,800 pounds of sulphurets that will go from $300 to $400 per ton. Sixty-five men are employed.

GRANITEVILLE.—*Transcript*, Aug. 18: Quartz mining in the vicinity of Graniteville has been giving better returns of late. The Rocky Glen mine, owned by John Hippert, is producing right along. Enough ore is extracted to keep the ten-stamp mill going 16 hours a day. The yield approximates $8 a ton, which gives a fair profit for working. A deposit of ore that looks as if it would pay $20 a ton, has been found in the California mine, and the owners have determined to secure the old Birchville ten stamp mill, put it up on their claim, and begin systematic operations. A company is taking out some first rate ore in the southern edge of town, and crushing it by arastra.

Placer.

MORNING STAR.—*Herald*, Aug. 18: Hawkins & Peardon of the Morning Star Quartz mine, made another shipment of bullion this week, the clean-up after about 25 days' run and from 125 to 130 tons of ore, which aggregated an amount equal to between $20 and $25 per ton. This same ledge was once worked by a corporation, and they closed down, because they couldn't make it pay.

Plumas.

RIVERDALE.—Quincy *National*, Aug. 18: This mine is now ready for action, and if no accident happens will show bedrock in from thirty to forty days. The machinery, which was purchased in Virginia, Nev., is splendid. The Blake steam pump, 12-inch cylinder, shows itself capable of handling three times the water which will be found. On Wednesday, the shaft, which is six by twelve feet, had fourteen feet of water in it, and the pump, running at one-third the speed of which it is capable, drained the water in less than fifteen minutes. There is every reason to believe this mine will be a success, as it is in the hands of men who have the means, and who know how to operate it. The depth to bedrock will be about one hundred ft.

CLAREMONT PEAK.—The tunnels are progressing as fast as the men can drive them. Some fine prospects give the owners much encouragement, and the gravel now being cut will pay three dollars to the car-load, if not more.

MAGALIA RIDGE.—Oroville *Register*, Aug. 16: New machinery for the Pershbecker mine is being put up. New and heavier pumps are being placed and the pumping and hoisting works are to run by steam power. At the Meredith mine good prospects are being uncovered. The Fred. Lang mine is in full blast. They have struck the bedrock at a depth of 104 feet, and are now searching for a channel. At the Indian Spring mine machinery is being erected for crushing the hard cement. This will pay from $40 to $60 to the ton. Austin Parish has found a good prospect at the Miocene flume, where it crosses his land. John Bear has a good prospect near where his old diggings gave out. He has been getting $2 to the pan. The Mineral Slide has shut down for the present. Nothing is being done at the Tom Neal diggings, as there is no water. The mine depends on rain principally. Parties running a tunnel on the Little West Branch, near the Tom Neal diggings, hope to find a channel of gravel. We hear that good diggings have been found near the Hendricks head dam on the West Branch.

San Bernardino.

GOLCONDA.—Calico *Print*, Aug. 18: Recent prospecting has resulted in the taking out of good ore in a half dozen places, but also in the discovery and opening of a ledge from 4 to 6 ft in width in the south end of the claim. Some of the ore assays as high as $7,000 to the ton, but the average assays give a little over $200 to the ton. The strike is the best that has occurred in East Calico for a long time. Four men are now at work, but as soon as practicable the force will be increased. There are 25 tons of ore on the several dumps that will be taken to the mill shortly.

NOTES.—John Anderson, of San Bernardino, has bought Robt. McCullough's interest in the Pinto. Keys and McGlinchy are working on the Cuba, No. 1. Another tunnel has been started in the Garfield below the one that now intersects the ledge. The amount of rich ore that is taken out is increasing as the work progresses. Work on the Taggart mine is still in ore. Operations on the Bismark continue. The usual force of men are engaged in the Oriental. The mine looks as well as ever. The King mine is sending to the mill the usual quantity of ore, and the amount of reserve ore is being increased. This mine is making an excellent record.

ALVORD.—San Bernardino *Index*, Aug. 18: The new Huntington mill for the Alvord mine is up and nearly ready for running. It will crush 10 tons a day. As the lowest estimate puts the Alvord ore at $20 a ton, and the working expenses cannot exceed $10, a profit will be made from the start.

ORO GRANDE.—The Oro Grande M. and M. Co., under which the Silver King, of Calico, is managed, held a meeting at Los Angeles yesterday, and de-

clared a dividend of $24,000 for the month ending August 14th. This is an increase of $8,000 over last month, and makes a total of $40,000 for the two months.

San Diego.

THE LOWER CALIFORNIA PLACERS.—San Diego *Union*, Aug. 14: Mr. G. Caravta showed us yesterday three beautiful specimens of placer gold, weighing an ounce or more each. Thirty ounces of this were brought up from the placers near the gulf side of the peninsula by a party of Mexican miners, who made the trip up overland in 14 days. They say there are 400 people, mostly Mexicans, at the mines. There is no water nearer than 40 miles for mining purposes, and the gold is obtained by dry washing. One nugget was obtained weighing over 5 pounds. The name of the camp is Canada, 45 miles from Gertrudes, and 500 miles south of San Diego.

Shasta.

NOTES.—*Courier*, Aug. 18: Arbuckle miners are jubilant on account of the good clean ups made there recently. Almost all of the miners have suspended work for the season, owing to the scarcity of water, yet the miners on South Fork will continue to get out ore and crush it in their arastras.

AFTERTHOUGHT.—It is stated that the Afterthought mill will soon be shut down and the mill and mine offered for sale. The owners are not familiar with mine and mill management, but the paying ore is there.

Sierra.

NORTH AMERICA.—*Mountaineer*, Aug. 11: The North America mine at Hepsidam, in this county, is a drift gravel mine, and for a long time the owners have employed Chinese as breasters. Recently the workmen thought they had cause for dissatisfaction, and quit in a body. A back channel was recently discovered, and the prospects are so good that the owners have decided to replace the striking Chinese with white men. The tunnel of the company is now some 4,000 ft long.

SOUTH FORK.—This company has just declared $309 dividend to an interest. They have put in a tail flume. The Bald Mt. Extension will resume work to-night. The Extension Co. took out 136 ounces last week, leaving over 100 carloads of gravel in the dump.

MAXSON LEDGE.—Downieville *Messenger*, Aug. 18: Capt. Mead of Oakland, arrived in town Wednesday, with the money to conclude the purchase of the Maxson ledge, Pig canyon, for $5,000. He has associated with him a gentleman by the name of Blood, and they propose to thoroughly develop the property. The ledge is from 4 to 5 ft wide and prospects well throughout.

FOUR HILLS.—A shipment of rich rock from the Four Hills came down last week, and there was all that a mule could pack. The invoice valued the rock—or rather gold, as there was more gold than rock—at $100,000.

RAINBOW.—Work has been commenced on a new tunnel at the Rainbow mine, starting as low down as possible. It is reported that the mill will have to be removed lower down when they begin to take out ore.

EXCELSIOR.—N. B. Fish has purchased an interest in the mining claims at Excelsior of Jas. Patterson, and moved up there to commence work. They will open the old St. Lawrence claims among the first.

KALAMAZOO.—The Kalamazoo mine, in Mohawk, is in bad luck. The mine owners got a shaft down 125 ft, when they encountered water. Then they let a contract at $3 per ft to sink a double shaft. A pump was procured, but it did not come; a man was sent from Reno to see what was missing. When all was ready, something fell down the shaft and broke the pump; and the result is that very little progress has been made this summer.

THE MINING OUTLOOK.—Sierra *Tribune*, Aug. 16: W. A. Skidmore, Secretary of the Miners' Association, has returned to San Francisco from a tour of the principal mining counties. His trip covered 20 days and an area of 1,000 miles in the counties of Sierra, Yuba, Plumas and Nevada. He states that, considering the shortness of the water season, the snow fall being exceptionally light, the mining prospect is bright. The snow lies only on the mountain peaks and there in patches, Pilot peak, in Sierra county, being the best covered. The recent discovery of the Four Hills mine in this county, he looks upon, from personal examination, as the greatest made since that of Bodie. The famous Sierra Buttes mine will shortly have an additional mill of 80 stamps in operation. The great hydraulic mines, which are suspended by injunction in the impending debris suits, are the Excelsior, at Smartsville, the Gold Run, above Auburn, and a prominent mine near Oroville. There is at Brandy city an unprecedented yield of the precious metals by the hydraulic process, Mr. Cadwalader's pocketful of injunction suits having given out far this side of that point. There are signs of decadence on every hand as the effect of the debris injunctions. But for such the hydraulic companies would be running bedrock tunnels and pushing many fresh enterprises. But outside of hydraulics the mining interest throughout the region stated is an enormous one and prosperity is everywhere apparent.

Trinity.

DEADWOOD.—*Journal*, Aug. 18: Frank Ballou, the veteran quartz prospector of Northern California, a man who has found more rich ledges than anybody and who knows how to look for them, has a big thing at Deadwood. His lode is 12 inches in width and the rock goes $100 to the ton. Another prospector in that district known as "Frenchy" recently found a good ledge right in the wagon-road and is running a tunnel on it. The surface rock is very rich and the lode well defined.

MORE QUARTZ.—From Mr. A. P. Haskins, of Trinity Center, we learn that that section is excited over recent quartz discoveries reported rich. Allison & Dean have splendid prospects from a ledge they found on the head of Hall gulch, while some sheep men exhibit rich specimens from a lode on Swift creek.

NEVADA.

Washoe District.

BEST AND BELCHER.—*Enterprise*, Aug 18: No work is being done in the drifts on the 2500 level at present, as they are waiting for the water to drain out. The ground is very wet.

UNION.—During the week the work has principally been at timbering the main west drift on the 3000 level. Day before yesterday however, work was resumed in the north drift, and it is now being advanced in vein material.

HALE AND NORCROSS.—No work can be done until the water has been lowered at the Chollar-Norcross-Savage shaft sufficiently to leave the west drift on the 2600 level clear.

SCORPION.—The west drift on the 500 level is in ground of a favorable character much more promising than any found to the east.

CON. VIRGINIA.—The joint California drift on the 2800 has been run out into a patch of wet ground, that was giving trouble in the winze, and the water caught up. The south drift on the 2700 level is making the usual progress.

ALTA.—At this mine they are now about ready to begin the work of pumping out their lower level.

CALIFORNIA.—The joint drift from the C. and C. winze, on the 2800 level, has been run in a sufficient distance to tap the water that was giving trouble in the winze.

SIERRA NEVADA. The main north drift on the 2900 level is making good headway, as is also all the work joint with the Union Con.

OPHIR.—On the 150 level are drifting west to get into the old vein. The vein at this depth has a western dip. Ore is still being extracted from the croppings.

SAVAGE.—The work of crossentting will be commenced on the 2600 level as soon as all is again progressing favorably at the Chollar-Noreross-Savage shaft and Hale and Norcross.

MEXICAN. Very fair progress is being made in the raise going up from the 2900 level, though the rock is quite hard. The north drift on the 3100 level is making rapid progress.

ANDES.—The large amount of quartz now being found promises well for ore.

YELLOW JACKET.—A considerable amount of ore is still being extracted from the old upper levels, and men are kept at the work of exploration.

GOULD AND CURRY.—Good progress is making in east crosscut No. 2, on the 2500 level. It is in a vein of porphyry of a favorable character.

CHOLLAR.—No further prospecting will be done on the 2600 level until the new hydraulic pump is completed.

UTAH.—Good headway is making in the north drift on the 1350 level.

UNION SHAFT.—Are still making repairs to the 2300 station.

Belmont District.

LAITY.—*Courier*, Aug. 11: Official report of Supt. Fassett: Level in Laity ground has been extended during past week 25 ft, making total length of level in ore 147 ft, the ledge holding its width and showing on its face splendid chlorides. Moore & Martin's ground is improving in quality of ore as we go south. Knight's ground yielding very high grade ore and the ledges much stronger than last week. Crosscut in South Tunnel still in very hard rock.

Candelaria District.

NORTHERN BELLE.—*True Fissure*, Aug. 18: The southwest drift on the fifth shaft level has been advanced ten ft during the week. Its total length is 192 ft. The crosscut to the south on the same shaft level has been extended 11 ft. The stope on the fourth shaft level is producing ore of excellent grade; the main drift being in the same body of sulphurets as last reported. The total production of ore from the mine has fallen off materially within the past two weeks, so that the running of mill No. 2 has been reduced to half time. The present yield of ore is 38 tons daily. All the work of prospecting is being pushed vigorously in every direction. The bullion shipments for the week ending August 16th amounted to $7,777.43, and aggregate $17,969.68 on August account to the same date.

MOUNT DIABLO.—The drift below the stope from lower winze No. 2 shows a strong ledge of low grade ore, while the stope above this drift is giving some $60 ore, and the ledge is improving in appearance. The stope near winze No. 1, below the third level, is yielding a little $50 ore. The stope above the third level, near winze No. 4, is giving some $200 ore from small bunches. The stope above the west drift from the Callison winze is not looking so well, but shows a little improvement in the center, and is yielding considerable ore assaying $75 per ton. Two bullion shipments were made during the week, one of $6,650.78 on the 9th instant, and another of $7,441.63 on the 13th.

Esmeralda District.

MT. CORY FIRE.—Esmeralda *Herald*, Aug. 18: News reached this place on Thursday last about 1 P. M. that the boarding and lodging houses of the Mt. Cory Mining Co. at the site of their reduction works, had been destroyed by fire about noon of that day. Since writing the above, in consequence of the fire, we visited the site of the reduction works. Everything has a business appearance, and we were surprised at the progress made in the construction of the works. The superstructure will be an immense one, strong and durable.

Eureka District.

SECRET CANYON.—*Sentinel*, Aug. 18: A piece of rock was found a few days ago in a crevice in the Water Jacket mine, which adjoins the Page & Corwin in Secret canyon, that assays $924.61 per ton in silver, A number of other samples are to be assayed, and if they prove valuable, work will be commenced.

Humboldt District.

COVE MEADOWS.—Reno *Journal*, Aug. 18: The copper mines recently located in Cove Meadows district, Humboldt Co., are said to be extensive. The locators are from Surprise Valley and Alturas, California. Patterson, Clark and Haynes have eight or ten miners at work on one of their copper mines, which is from twelve to fifteen ft wide. They intend to take out a thousand tons of ore before erecting smelting works.

Tuscarora District.

ELKO CON.—*Times-Review*, Aug. 16: Since last report, shaft No. 2 has been placed in good order. Started up machinery for permanent work yesterday, the 15th inst, and resumed sinking to-day.

GRAND PRIZE.—West drift, 300 level, extended 21 ft; total length 53 ft. The vein is 12 inches wide, showing good ore in spots, and looks promising. South drift, 400 level, extended 14 ft, total length 93 ft. The ore produced is high grade.

ARGENTA.—Since last report north crossent 400 level extended 11 ft; total length 24 ft.

BELLE ISLE.—On the 450 level the north drift has been extended 14 ft.

NORTH BELLE ISLE.—Contractors have encountered favorable ground and good progress has been made in the drift south on the 300 level.

NAVAJO.—The station at the 650 level is being cut out as rapidly as possible. The compressor is on the ground, and will be running soon.

INDEPENDENCE. In the drive south on the 400 level, we have made fair progress. Total length of drift 944 ft.

ARIZONA.

SILVER KING.—Pinal *Drill*, Aug. 14: Silver King is now lively. The King mine is down 900 ft vertical, including the old works. They have laid surface pipe 600 ft connecting with the water tanks. All the property of the company is within reach of three great streams at any moment, and the ventilation in the mine is perfect. The mine is looking as well as ever. There are no known bounds to the ore body. The mill runs constantly and is in better shape than ever. They run 12 tables, 20 stamps and work up 60 tons per day in concentration.

PINE SPRING.—*Courier*, Aug. 10: The ten ton shipment of silver nuggets and rich ore from the Pine Spring mine ought to open the eyes of sleepy San Franciscans. It will be in the city in about 12 days. Mr. Austin, who arrived recently from the mine, assures us that $100,000 is a small valuation to place upon the stuff that has been taken out of the shallow shaft. The extension on the Pine Spring known as the Cash Entry has five ft of ore which has sampled $274.45 to the ton.

BIG BUG.—The Silver Belt mine, Big Bug district, is still in bonanza. From 30 to 35 men are employed in and around the mine. An average of 120 tons a month is being shipped to Pueblo, Colorado, for treatment. The rock is rich, easy to work and should be treated at home. G. W. Bowers & Co. are doing well with their Chip mine and mill. The south extension has just been sold for $5,000. New York people have just purchased the Deposit mine. Yuma county, for $18,000.

COPPER.—Prescott *Miner*, Aug. 10: Mr. Murray, one of the owners with Governor Tritle in the United Verde property, informed us to-day that the smelter was working like a charm, yielding eight tons of copper bullion per day. On the 6th inst., the company shipped 24 tons, the result of three days' work.

AROUND HOWELLS'.—The Belle furnishes all ore necessary for the smelter. The amount of bullion produced daily is about five tons, worth from $400 to $800 per ton.

COLORADO.

GUNNISON.—Georgetown *Miner*, Aug. 4: The Legal Tender, at the head of Tonichi creek, shows 30 ft of solid ore at the bottom of a 60-ft shaft. It runs from 50 to 100 ounces and a 12-ton carload is shipped every other day to Canyon city. Mr. Johns, formerly of the Grant smelter, at Leadville, says the vein is the largest for high-grade ore he has ever known in Colorado.

TELEPHONE.—A mill-run from the Telephone lode, T. J. Cantlon & Co., owners, returned last week for first-class 704 ounces silver and 30% lead per ton. The second class ran 75 ounces. A 2,500 pound lot, first and second class, netted over mill charges, $645.62.

VULCAN.—The stope beginning 100 ft east of the Egan tunnel is now 180 ft long and no where over 30 ft high, with about 270 ft above that to raise on. There is ore the entire distance varying from two to twelve inches in width. It consists of sulphurets, and high grade galena. The last mill run of three tons returned for first-class 476 ounces, second class 216 ounces and 23% lead.

BIG CHIEF.—Twelve men are running three shifts daily on the Big and Little Chief drifts. The former is in 110 ft, the latter 50. The Big Chief crevice at the creek is 100 ft wide, and prospects well in gold. Twenty thousand dollars has been paid down towards the mill. Two Germans, a Lutheran minister and a brewer in the east, worth millions, are reported to be at the head of the enteprise.

BIG STRIKE.—A new district ten miles southeast of Chicago creek was prospected last week by Billy Man and another. They made four locations, some specimens from which, returned respectively 327, 107 and 100 ounces silver. The lodes begin right at grass roots, and one of them has a crevice 20 ft wide.

LITTLE ALICE PLACER MINE.—A gentleman from Silver City showed the mining reporter several pieces of native silver taken out of the sluice boxes on the Little Alice placer claim. This mine has been considered more of a gold than silver producing property, and this find naturally leads one to the conclusion that there is a belt of silver veins passed through that section. The finding of these nuggets has created quite a sensation and a number of prospectors are at work.

WILL PAY NOW.—Large quantities of ore are now coming out. Low grade stuff, running from 25 to 60 ounces, which in the early days was thrown away as worthless, yields a profit now. Old stopes are being re-opened and old dumps sorted.

NOTES.—*Miner*, Aug. 11: A party of lessees on one of the prominent mines at Georgetown, had a run of a lot of ore last week, which gave $1,120 first-class, and $346 second class, per ton. The Paymaster lode at Decatur, Mr. Sam. Roberts reports to be producing 15 tons per week assaying 64 ounces silver and 70% lead. The Ben. Dare lode is a new discovery in Cotton Wood gulch. It shows a well defined crevice and is claimed to be an extension of the Swiss lode. Assays of the surface quartz ran as high as $120 silver and gold.

IDAHO.

LITTLE SMOKY.—Ketchum *Keystone*, Aug. 9: The Silver Star and Salamander mines, on Little Smoky, have been sold to the Philadelphia Co. of this place, for cash $51,000. The Silver Star is developed by two 100-foot shafts about 100 feet apart and a shaft of less depth about 500 ft from the first, all on the ledge, which is thus shown to be continuous. The vein is large, averaging six feet in width.

SILVER KING.—The Silver King mine, in Beaver gulch, Sawtooth district, has been sold to Matthew T. Scott, of the Davitt, for $125,000. It has produced about $40,000 worth of milling ore, most of which now lies on dump. This ore averages in value 100 ozs., and often contains large samples worth 400 ozs. per ton. The mine is but a few miles from the mill of the Columbia and Beaver Co. It is easily accessible.

NOTES. The Queen of the Mountains is developing handsomely and has paid expenses from the start. Harry Hill, the Supt, informs us that ten or fifteen tons are ready for shipment to the Philadelphia smelters. The Idaho now looks better than ever, and is producing more than enough to pay development work. At Vienna Mr. M. K. Evans of Ketchum, is developing the Vulcan and Mary Graham lodes, the latter of which he has bonded. The Vienna mill continues to run without cessation. It has not been shut down once since starting. James Davison is preparing to ship fifteen tons of high grade ore from the Pride of Idaho on East Fork. The O. K., at Bullion, is shipping large quantities of high grade ore to the Philadelphia smelters here.

SAWTOOTH. *Times*, Aug. 8. John Church, who has been working three months on a prospect, has struck a foot and a half of ruby and native silver. The name of his location is the Silver Eagle, and the strike has created a sensation. There is a greater number of prospectors in the hills about Sawtooth, than at any former time. Matt. Hannan is extracting very rich black sulphurets of silver from the Mountain View. Col. Brodhead and George Griffith are having rich black sulphurets and brittle silver ore, averaging 800 ounces to the ton, taken out of the Scotia mine. They have 12 tons of this ore on the dump.

MONTANA.

NORTH PACIFIC EXHIBIT.—Butte *Miner*, Aug. 8: A *Miner* reporter yesterday inspected at Caplice hall the collection of specimen ores, gathered in Summit Valley district, for the Northern Pacific exhibition cars, and there seems to be little doubt that in their exhibits from place to place throughout the United States and probably in Europe, more real benefit will accrue to our mining interest, than could be derived from any other exhibition of ores in which Montana has ever been represented. Then follows a list of some 25 contributing mines, with the assay value and the composition of each specimen in silver, gold, and copper. The silver showing is from 100 to 2,500 ounces per ton.

ANACONDA.—The Anaconda Co. is pushing work on the concentrator and smelter—the largest enterprise of the class in the United States. An express is run twice a day to the Warm Springs station, and visitors from Butte and Deer lodge crowd the streets.

BOWLDER.—Helena *Independent*, Aug. 9: The Bowlder mine near Basin city, owned by an Indiana Co., has during the last three months under a lease paid handsomely. Some of the ore ran as high as $40 per ton in gold saved in the mill, and still the principal value of the mine product is in silver. The lease expired on the first instant and the corporation now contemplates changing their mill so as to enable them to save the silver. At present it only saves gold.

NEW MEXICO.

MONASKA MINE.—Kingston *Tribune*, Aug. 9: There are between 60,000 and 70,000 pounds of ore at the Monaska mine, already sacked and awaiting shipment, besides large quantities in the sorting room awaiting sacks. Some five or six tons of ore have already been shipped. The 1st, 2d, and 3d levels are in very rich ore. As an example the output of ore was, in one instant last week, 180 sacks of ore in two shifts, the ore assaying from 400 to 12,000 ounces per ton. The bottom of the shaft is in rich ore, but sinking has been suspended awaiting the arrival of pumps—which are on the way—the water coming in so fast that work could not be prosecuted to advantage. Twenty-four men are employed on the mine. The hoisting machinery is working finely.

SILVER MONUMENT.—One hundred and seventy-two sacks of the richest looking mineral yet mined in the Apache district has been taken from the Silver Monument mine since the last shipment. The first shipment milled $1.40 in silver; the last gave $240, and the ore on the dump now ready for shipment is expected to yield $500 per ton. The shaft is now about 130 ft deep.

OREGON.

CALUMET MINING CO.—*Oregonian*, Aug. 14: The Union *Record* says: Sol. Center, superintendent of the Calumet, has been making preparations for working the ledge, and for opening a trail to the same. This great copper mine, doubtless the richest and most extensive ever discovered, is in the Granite range, 30 miles east of Union, in Union county, and was discovered in 1879. The company has secured M. F. Holbrook, an old pioneer and practical mountaineer, to locate the trail. The work of developing the mine will be carried on energetically. Mr. Center daily expects eight or ten practical miners direct from Lake Superior, who will at once be put to work, and should the mine turn out as expected, at least 200 men will be employed there this fall.

UTAH.

SOUTHERN UTAH.—Cor. Salt Lake *Tribune*, Aug. 15: A rich find has been made in the mountains near St. George. A ton or more of ore is on the dump, some specimens ranging as high as $130 in silver. Before drifting 20 ft, a two ft vein was struck. A shaft 87 ft has been sunk in this. A drift 20 ft deep has been run horizontally into the hanging rock. This ends in the vicinity of a cave, exhibiting a high grade of carbonate ore. Prospecting is done by contract. Gillispie, Lund & Co., of Silver Reef, are developing this claim. Watson M. Nesbit is the manager. The merit of the discovery is due to him. Ten full claims designated the Mammoth mine, have been entered. This lies in the center of the Beaver Dam Mining district, bordering on Nevada on the west. Twenty-five miles from St. George and 12 miles south of Santa Clara river, a rich copper mine has been discovered.

Working Placer Mines Where Water is Scarce.

A correspondent of the *Mountain Messenger* (Sierra county, Cal.) writes as follows:

I had heard of a wonderful self-acting dam in operation in Davis' ravine, up the North Fork, about six miles above town, built by Abraham Moser, a former resident and miner in Shasta county, where these dams have been worked several years. Having seen different appliances for mining in various parts of the world, I determined to see this novel arrangement, and started up there on Friday last. On the way I noticed there were more men mining on the old river and its banks than any of the other streams around Downieville, for the Middle and East Forks are almost entirely deserted, even by Chinamen. I arrived and was welcomed by Jim Gilson and Mr. Moser. The dam had just emptied itself, and they were rolling away the big bowlders, loosening the gravel with their picks. It takes about two hours for the dam to fill, and then about that time to prepare for the cataract. Jim was enthusiastic, and said: "Be the powers, when she goes we have to sthand from under; be jabers she's a daisy—works while we are sleeping, an' makes things howl. She'll be off again in half an hour," and I waited to hear the howling. Presently there was a loud, rumbling roar, and "here she comes" from Jim. We could see the fine spray, like mist, rising, coming down the steep ravine, and the water leaping, bubbling and boiling in a white foam. It took down a log twelve feet long and two and one-half feet in diameter, and we could hear the big howlders, some more than a ton in weight, groaning and grinding beneath the furious water.

All traces of the loosened rocks in the channel for five or six feet wide were gone. In five minutes the water subsided, to be again repeated in two hours. Every particle of gravel and sand was washed from the bedrock on the line of the stream. The gold can easily be picked up, as the bottom is lava. When the dam was again near full, I went up to see the next operation, and observe how it worked. On top and at right angles with the dam is a beam or lever thirty-five feet long, resting on an iron pin at about one-third the length of the beam. The outlet from the dam is nine feet long and two feet deep—that is, eighteen feet of water—with ten feet of pressure suddenly let loose, and what we would call the gate is an apron, made of canvas, nailed on its upper edge to the beveled aperture. It does not rise like an ordinary gate, but partly rolls up, like a theater curtain, when that end of the beam rises. At the lower end of the beam is suspended a tub, with small holes in its bottom, and about sixteen feet from and near a level with the top of the dam, when the gate is down. From the lower edge of the top of the dam is a common sluice box, sixteen feet long, with a ten-inch high gate in it to hack the water ten inches over the surface of the dam.

This gate has a small lever, to the lower end of which is a wire connected with an oil can underneath the box. The oil can has holes in the bottom. When the water in the dam runs over the small gate, it fills the oil can; that brings down the small lever, and raises the gate in the sluice box, allowing ten inches of water to rush into the large tub; that fills instantly and brings down the large beam that is ballasted. The upper end raises the apron or canvas gate, then there is a rush and the roar of eighteen square feet of water with ten feet pressure. By the time the water has rushed out of the dam the water in the tub has run out of the small holes in its bottom, the weights at the end of the lever above the dam have brought that end down, the curtain is closed, and again the reservoir begins to fill; the water runs out of the oil can suspended below the sluice box, and the small gate comes down to its place; and thus it works, day and night, twelve times in twenty-four hours; and two men can do the labor of ten or twelve with more ease than the ordinary way of mining, and scarcely leave a particle of gold behind them. The old ravines that have been rich can by this process almost all again be made to pay handsomely. After the dam is once built it is the most attractive process of mining there is, and when it comes into general use, as it surely will, it will be the most popular. Thousands of ounces of gold will find their way into Downieville that would not be brought in by any other process at working the old, deserted ground. The miners can pay a visit and see the operation for themselves, and may then understand it better than any attempt at explanation. But it is, as Jim Gilson says, "Be my soul she's a power; works at night like a giant; by day she's a daisy, and makes things howl."

CALIFORNIA PETROLEUM.—A dispatch from Bradford, Pa., says: A well-known Pennsylvania oil operator, recently returned from the petroleum districts of the Pacific coast, gives a glowing account of the nature and profits of the operations there. He says the finding of oil in the California districts is as certain as it was in the Bradford field. The drill always finds deposits, and no failure—at least in three of the districts—has yet resulted. It costs $7,000 to put down a California oil well after the tools are on the ground, or twice as much as a Pennsylvania well; but after it is down and flowing or pumping, the California well is a much more valuable piece of property than the other.

Idaho Coal Fields.

The Wood River *Times* says: A. L. Rinearson, the well known surveyor, has come from Boise to look after some business matters. Mr. Rinearson brought with him a small quantity of the coal which was found in the Squaw creek country about a year ago, and which he has been busily engaged in developing ever since. With what he brought here he has had tests made at the blacksmith shops in town, and with the most satisfactory results, the coal being as good, in all respects, as any blacksmith need use.

Mr. Rinearson did not bring the coal here to advertise it for the purpose of creating a demand for it, as he has a good home market at $20 a ton for all that he can extract, and this without any trouble on his part. Dave Conghanour, superintendent of the Gold Hill mines, at Quartzburg, who has been paying $120 a ton for his coal until recently, has made a contract with Mr. Rinearson for his entire winter supply for all purposes.

The new coal fields cover an area of twelve miles square, or four townships, and crop out for the entire distance. But four persons have as yet become interested, to wit: Messrs. Miner, Rolfe, Stone and Rinearson; but it cannot be long before quite an industry will spring up there, and the coal fields be all taken up. The find under consideration is hardly thirty miles distant from the Oregon Short Line, and only twenty miles distant from Boise, the terminus of the connecting line.

The importance of this find to Wood River and to the great Northwest generally cannot be overestimated. It will secure to us a first-class fuel at the price of a second or third-rate article, and thus be of incalculable benefit in various ways. In the development of the smelting industry of Wood River this new coal will play an especially prominent part, as the coke produced from it will materially reduce the cost of smelting, and enable us to reduce at home large quantities of ore that would otherwise have to be left in place, or shipped and sold on a very small margin of profit.

The new coal will not be available for the Wood River market for a year or so; but by that time the mines will doubtless be sufficiently opened to insure a steady yield.

For awhile the coal will have to be brought to Hailey over the Oregon Short Line to Shoshone, thence over the Wood River branch. But in time a direct line of railway will doubtless be built from Wood River to the coal fields—a distance of only ninety-eight miles in an air line—and we will then have the coal brought here at minimum cost.

Raising Coal from Deep Shafts.

The question of raising coal in deep shafts is slowly but surely demanding more and more attention from the mining and mechanical engineer. Every year the area of unworked coal lying at shallow depths from the surface is becoming less, and the resources of England for supplying the current and increasing demand lie at increasingly greater depths; hence many new sinkings have been carried down much deeper than those of earlier date; and, looking forward beyond immediate wants, the total area of unworked and unproved coal in the United Kingdom is no doubt very large, but much of it will be found at depths greater than any as yet reached. Some writers have quoted 4,000 feet as the limit of accessible depth, beyond which the increase of temperature and other difficulties will prevent the mineral being worked. Other authorities have estimated it up to 7,000 feet. In the year 1866 a royal commission was appointed to investigate the quantity of available coal, and the report placed the maximum depth at 4,000 feet, a limit which has been adopted by many scientific gentlemen. The deepest mine in England is Rosebridge, 2,418 feet; that is, 806 yards deep. This has been at work for some years, yielding a fair quantity of coal. The deepest coal mine in the world is one near Charleroi, Belgium, namely, St Andre shaft, at the Poirier colliery, which is 2,724 feet; that is, 908 yards deep—830 meters. The coal is raised by an iron wire flat rope, seven inches broad, and composed of eight strands, its weight being 9 tons, 11 cwt.—9,700 kilograms. The Simon Lambert shaft, in Belgium, is 3,489 feet; that is, 1,163 yards deep; but this is only an exploration shaft, and not worked, being partly filled with water. At the St. Andre shaft the winding is slow, and the quantity of coal raised about 260 tons per day. There is another deep shaft near Charleroi, the Sacre Madame colliery, at Dampreney, which is 2,498 feet, that is 833 yards deep, where the coal is raised from bottom to top in fifty-seven seconds. This is about the same speed as that run at Rosebridge. It may be inferred from these facts that the depth of 4,000 feet is not too great an assumption of the ultimate limit of coal working; and considering the great area of unworked coal lying between the average or the greatest depth of the present shafts in England, and the contemplated depth of 4,000 feet, there is little necessity, at least for some time to come, of entering into any theoretical opinions or calculations to prove the possibility of raising coal, in one lift, from the greatest possible depth at which coal could be worked. It is probable that the limit of depth will not rest or be governed by the mechanical appliances used in raising the coal, but by temperature due to depth and the weight of the superincumbent strata.—*Coal Trade Journal.*

A New Kind of Quartz Mill at Grizzly.

Of late much attention has been attracted among miners at Grizzly to a new invention in the way of a quartz mill that is now being tested there. It is called the Dyer Cannon Ball mill, and those who have seen it work are confident that it will be a success. The mill is in the shape of an upright cylinder, the ore being thrown into the top where it is broken into small pieces, while below are some revolving iron balls that reduce the hardest quartz to a powder. With a very small expense self-feeding apparatus can be attached to the mill. Screens can be used the same as on an ordinary mill, and its appliances for saving gold are as perfect as those in any stamp mill can be. Heretofore all attempts at making a good cheap mill have proved failures. Men in the East who have little acquaintance with the nature of quartz and its reduction, have invented and sent out mills that would rattle to pieces and wear out with a few weeks' run. The inventors of the Cannon Ball mill are old miners who have had many years experience in the reduction of quartz in the northern part of the State. They put up one of their mills on the Eagle King mine near Grizzly about six weeks ago, with the agreement that if it did not work satisfactorily it was to be removed without any expense to the mining company. It was successful beyond the highest expectation of those who saw it operate. Miners came from every direction to see it, and all were very favorably impressed, despite the general prejudice there is against all others than stamp mills. The cost of one of these mills of the largest size is less than $500 when all ready to work. An ordinary ten-stamp mill costs from $5,000 to $6,000. Any kind of power can be applied to the Cannon Ball mill. With from two to three horse power it will reduce from six to eight tons of ore a day, which is almost as much as can be reduced in a ten-stamp mill. The machinery is simple, and the parts exposed to wear can be replaced as easily and cheaply as the shoes and dies in a stamp mill. Only one man is required to operate it. After the six weeks' run at the Eagle King mine, the mill was in as good condition as when first put up. It not only proved the mill to be a success, but also the mine. The visiting miners were delighted with the sight of the amalgam that kept piling up on the plates. It only took a few days' run to pay the price of the mill. This is a good mine, and will, no doubt, be booming as soon as Mr. Camp, the superintendent, who has been very sick, recovers his health sufficiently to attend to it. Other Cannon Ball mills will soon be put on other mines around Grizzly. The owners offer very liberal terms to any poor miner who has got a ledge. They offer to put up a mill for any one who will get out fifty tons of $10 ore. They will reduce the ore and take their pay from the proceeds. This will enable any poor man who has a small ledge to get a mill of his own. Heretofore poor men have not been able to work mines because of the great cost of erecting mills, and the expense of hauling the ore for miles to a mill soon eats up all the profits. Many a mine has proved a failure because the owners spent all their money in building a mill, and then were not able to open the mine. Our county is full of small ledges that would pay to work, and if the Cannon Ball mill continues to work as successfully as it has in the past, hundreds of miners will soon find independent and profitable employment. The introduction of this mill may mark a new era in quartz mining, and not only prove a great benefit to its owners, but also to the county.—*Placerville Democrat.*

Pioneers of the Comstock.

The Reno *Gazette* says: The first locators of the Comstock lode seem to have but little interest in it now, and they are scattered far and near. Alva Gould, who staked the party of prospectors that discovered silver in Gold Hill in 1859, lives in Reno and runs a fruit wagon around through the ranches in the valley. Abe C. Curry is dead. A. G. White, of the Murphy and White, is in the sheep business. He lived some years at Tecoma, Nevada, but moved north last year. John Murphy made a raise and died in San Francisco. R. D. Sides is at work on Theodore Winters' ranch in Washoe valley. John D. Winters is in California. He was in Reno a couple of weeks ago. Jos. Kirby is in Virginia City. Henry B. Comstock suicided in Boise City in 1868. Emanuel Penrod is in Elko county mining. Pete Riley and Pat McLaughlin are dead. John Bishop has been in Reno inside of a month. He is not rich. H. B. Camp is in New Mexico. James Corey is working a mine on American Flat. Joseph Webb is dead. E. Belcher is in the cattle business in Evanston, Wyoming. Abernethy is at Suisun and Baldwin is at Napa on a farm. Casteli froze to death at Meadow Lake. J. C. Osburn is dead and Joseph Rogers shot himself in Virginia. Sandy Bowers is buried on the hillside back of the Bowers mansion in Washoe valley, and his wife is telling fortunes. Len C. Savage has been dead some years and his wife is a respected citizen of Reno. Norcross is foreman of a planing mill in San Francisco. James Finney, "Old Virginny," is dead. Not one of the old boys has a cent's interest in the Comstock, and few of them much property of any kind.

THERE is no truth in the report that the steamship *Wellington* will bring a cargo of coolies for the Wellington mines.

Oregon Copper.

The Walla Walla *Union* says: "About a year ago a vein of copper ore was struck in Baker county, Or., and has since been partially developed by a Walla Walla company, organized by H. E. Holmes, A. Reeves Ayers, T. J. Anders, J. M. Boyd, A. B. Weed and Frank D. Boyer. Recently, Dr. Boyd went over to Seattle, and the *Post-Intelligencer* of that place is moved to relate as follows: 'It will be remembered that about twelve months ago copper was discovered in vast quantities in Baker county, Or., and that M. V. B. Stacy, John Leary and E. S. McComas became the owners of three claims on the principal lode. A company in Walla Walla, represented by H. E. Holmes and others, also became the proprietors of the three adjoining claims. Considerable sums of money were expended last year in prospecting by both companies, and the ore was brought prominently before San Francisco and Eastern capitalists, who, having it assayed, pronounced it equal in richness to anything yet discovered. The attention of the Lake Superior copper company was called to it, whereupon Captain Hoatsen, superintendent of the Lake Superior Calumet mining company, was sent out to examine and report upon the mines. The result was a consolidation of the Walla Walla company and the Seattle company, Captain Hoatsen agreeing to immediately commence the development of the mines. The captain, who is at present in Seattle, reports that two chimneys of copper in sight are of immense value, providing the vein runs true and are unbroken, which can be fully demonstrated upon an outlay of about $5,000. The Lake Superior company takes one-fifth of the consolidated mines, paying $100,000 therefor, conditioned upon the lodes proving as good as they appear on the surface. M. S. Booth, in the interest of the Copper King company, is now at the mines, and yesterday he was wired to return to Walla Walla and meet Captain Hoatsen and the gentlemen connected with the Walla Walla company, sign articles as trustee of the consolidated company, and turn over the personal property of the Seattle company to the consolidated company. The trustees of the consolidated company are principally citizens of Walla Walla and Seattle, John Leary and S. M. Booth representing the Seattle interests as trustees. Captain Hoatsen, who visited these mines, states that if they turn out one-tenth as rich as the veins now exposed would indicate, the consolidated mine is worth millions of dollars.'"

Washington Territory Iron.

Fifteen years ago Hon. Arthur A. Denny discovered a valuable ledge of iron ore up near the Snoqualmie pass, on the west side of the mountains. Subsequently Messrs. A. A. Denny, A. Mackintosh, Jerry Borst, and S. H. Taylor became interested together, and took claims. They now hold 13,000 feet of iron territory. Until very recently nothing has been done toward developing these valuable deposits of mineral. A short time ago the gentlemen above named placed funds in the hands of C. K. Jenner, Esq., for the purpose of developing their property. He now has a force of thirty men engaged in clearing a road up to the mine, erecting cabins and carrying in supplies. This force will be worked during the entire season on the property. The quantity of iron ore owned by these gentlemen is practically inexhaustible. There is absolutely no end to it. Mr. Denny informs the *Chronicle* that he has obtained assays from competent parties which shows a per cent of from 80 to 87 iron. This is remarkably pure and the iron is of the most excellent character, equal to the best produced in the United States at this time.

The railroad surveys for a line over the mountains via Snoqualmie pass cross these ledges. They are from the present line adopted by the Northern Pacific via. Stampede pass, not to exceed nine miles distant at the nearest point. There is not the slightest doubt that a railroad will be run to the mines within a comparatively short time, and that its product will be made into articles of commerce at this place. This mine is one of the many sources of latent wealth which seem to literally hedge this city about.—*Seattle Chronicle.*

THE Smoke Abatement Institution is a London notion. It was recently stated, at a meeting of the same, by the Duke of Westminster, that it was an admitted fact that a sum amounting to no less than £1,000,000 was annually lost in London alone in the shape of unconsumed fuel, which escaped in the form of smoke, and that damage was caused to property to the amount of fully £2,000,000. Here is a fortune for a Yankee inventor.

OIL IN COLORADO.—A Denver dispatch says: For three years or more capitalists here have prospected for coal oil in the vicinity of Canyon city, in this State, but with indefinite results until Wednesday night, when a vein was struck in the Land Investment Company's well, which has since yielded at the rate of 40 barrels per day, and of excellent quality, demonstrating to a certainty that oil exists in paying quantities in that vicinity.

ARRIVALS from Quatsom, B. C., report that the West Vancouver coal company of San Francisco have struck a fine seam of bituminous coal in their claim.

The Engineer.

Aerial Navigation.

Inventors seem determined to make aerial navigation a practical success. The latest important effort in that direction is referred to as follows by the *Scientific American*:

A certificate of incorporation has been filed in the office of the Secretary of the State of Illinois for the "Aerial Navigation Company of Chicago," the object of the incorporators being "the transportation of passengers and freight through the air." It is asserted that the machines to be manufactured by this company are a perfection of the one tested at Hartford, Conn., several years ago, which at the time attracted considerable interest. Probably this refers to several trials of a balloon made by Mr. E. F. Ritchel, of Bridgeport, Conn., who exhibited in Hartford, in June, 1878, a balloon with propelling apparatus attached by which the upward and downward movements of the balloon could be governed, and by which in calm weather its course could be directed.

The balloon was a horizontal cylinder of silk, twelve feet long and twenty four inches diameter, capable of containing 3,000 feet of gas. Suspended to it by cords and steel rods was a flat frame of brass pipe, pointed at each end, and having a seat for the operator. In front of the seat was a gear wheel with two cranks, connected by a vertical shaft and a horizontal shaft of two peculiar wheels, one at the lower end of the vertical shaft under the frame, and the other in front of the operator, and this wheel was attached to the shaft by a universal joint so that it could be turned a distance of about thirty degrees from the shaft in a horizontal plane by the feet of the aeronaut. This wheel was the propelling power and also the steering device. The levitating power of the balloon was barely sufficient to raise the apparatus and its load, the vertical propeller assisting if a rapid rise was desired, and bringing the balloon down without emitting any gas.

At one trial, on a calm day, the balloon rose from the baseball grounds at Colt's Meadows, Hartford, passed over Colt's factory, and nearly over the Connecticut river, turned about and returned, descending to the ground at the place from which it started, the distance being probably half a mile and return, the balloon's height after rising from the earth varying from three hundred to four hundred feet, or thereabout.

At another trial, on the succeeding day, with quite a stiff breeze blowing, the aeronaut was unable to turn his balloon around, or to stem the wind, and was forced a distance of nearly nine miles, when he descended and came back, with his balloon, by carriage. But on this occasion he descended once on his trip to the dooryard of a farmer, procured a glass of water from the well, and rose again, hoping to make a return trip.

No accurate test was ever made of the propelling or lifting power of the two fans, but they were sufficient, as proved by repeated experiments, to raise, lower, and steer the balloon except in a strong wind, the operator rotating the cranks at the rate of one hundred revolutions per minute, producing, by means of pinions, a revolution of the fans of 3,500 turns per minute.

A Gigantic Dock Enterprise.

So great has become the demand for water front in London that the East and West India docks company of that city has boldly embarked upon an enterprise for obtaining the necessary room by improving the river Thames at a point many miles below the city. In fact, it implies the formation of an entirely new entrepot for the heavy shipping business of that great mart. The plan is nothing more nor less than the construction of docks at Tilbury, on the Thames, opposite Gravesend, of such magnitude that the *Globe* says: "On the whole, this dock extension promises to be the most remarkable that even London has ever witnessed, and will leave all other ports in the world far behind." They will have a tidal basin with a depth of forty-three feet, and the largest vessels afloat will go in and out without regard to the tide. The contracts call for four dry docks, with a total length of 1,730 feet, a floating derrick with a lifting capacity of 100 tons, special wharves and abattoirs for the cattle traffic, 15,000 lineal feet of quay berths, from forty to fifty miles of permanent railroad tracks, and a large hotel for the accommodation of passengers. "Tilbury is certainly at a considerable distance from London," says the *Globe*, "but with the railway facilities to be organized a few miles more or less will really be a matter of no great importance, while it is undeniable that, with the huge ships of the present day—and they still seem to be continually advancing in dimensions—the avoidance of a few miles of river navigation, with its windings and shallows and fogs, and the necessary cost of tonnage and pilotage, must be an immense advantage." The contracts call for the completion of the work within two years and a half, of which one year has already elapsed.

Over the Ocean on Wheels.—A dispatch from London, dated July 29th, says that Terry, the man who left Dover at 9 o'clock yesterday morning on a floating tricycle, crossed the English channel, and arrived safely at Calais at 5 o'clock in the afternoon.

Useful Information.

Horseshoes.

Horses were not shod in Egypt, Assyria or Palestine. The latter country was supplied with horses by the Egyptians. Solomon paid 150 shekels of silver, equal in value to $75, for each horse. This was a high price, the difference in relative value of a shekel and a given weight of wheat being considered. Isaiah speaks of horses whose "hoofs shall be counted like flint"—a valuable quality where they were shoeless. The Syrians and Hittites were supplied with Egyptian horses by Solomon, who thus turned an honest penny by this means.

Aristotle and Pliny mention the covering of horses' feet in stony places to protect the hoof from breakage and wear, but it is probable that such a covering was a bandage or boot, and used principally on long journeys. Suetonius refers to the dismounting of Vespasian's muleteer to shoe his mules. Wrappings of plaited fiber, such as hemp or broom, were used, as was also leather. In Japan the horses have clogs of twisted straw, of which a large supply is carried on a journey; when worn another is immediately applied. The American custom of shoeing would no doubt appear a barbarous custom in their minds. Captain Cook refers to the fact that the Siberians and Kamtschatkaus use traveling socks for their dogs.

Camels in old times were similarly provided. These boots were drawn on over the feet, and it does not appear that iron or other metallic plates were nailed to the hoofs. Such boots were shod with metal for the rich. The mules of Nero were shod with silver; those of his wife, Pappea, with gold. For less stately purposes mules were shod with iron. Homer mentions brazen-footed steeds, probably a merely metaphorical expression implying strength. Mithridates and Alexander experienced great difficulty with their cavalry, owing to the soreness of the unprotected feet of the horses in long marches. The first certain mention of shoes being nailed to horses' hoofs is in the works of Emperor Leo, ninth century. The practice of shoeing horses is said to have been introduced into England by William I.

In two respects the shoeing of horses in Holland differs from ours. First, to prevent slipping, the forehoofs are pared away to the toe, and the shoe so fitted that the toes do not touch the ground when the foot stands flat, the weight resting on the middle and heel of the shoe. Second, the shoe is nailed on perfectly flat and close to the foot, which is flattened to receive it—the iron is thereby deprived of all spring, and the hold of the nails is undisturbed. The frog comes in contact with the ground.—*Blacksmith and Wheelwright.*

Asphalt as Fuel.—The large amount of asphalt found in this State and many other portions of the globe furnishes inventors a good field for the study of some effectual means to utilize it as fuel. It is said that many of what were at first thought to be coal mines, especially in Mexico, are really deposits of bitumen. Now, while asphalt is highly combustible, there seems to be at present no practicable method hitherto suggested to utilize it as fuel, owing to its ready melting when subjected to heat. It is likely, however, that with the demand for cheap fuel now felt, especially in California, and in those sections near which our principal asphalt beds are found, some effective method might be devised to make practical use of its heat producing qualities; burning it, perhaps, after reducing it either to a liquid or vaporized form. The inventor of such a process could command a handsome fortune for the use of the right in this country. The products of the new oil wells in Vera Cruz, much of which are said to be too heavy for illuminating purposes, might also be utilized in the same manner.

Oily Substances in Rice.—According to G. Campari ("Annals of the Milan Society of Applied Chemistry"), oily substances are contained in large quantities in the embryo of the rice, which he finds to be composed of 95.54 per cent of fatty acids, and 4.46 per cent of glycerine. Treatment with bisulphide of carbon produces a yellow wax-like substance which readily saponifies with bases, melts at 32° C., becoming quite solid at 28° C., with a specific gravity of 0.93005. It is completely soluble in ether, chloroform, and benzine; its composition appears to be C 79.2, H 10.9, O 9.9, per cent. The fatty acids melt at 36° C., emit a perceptible pear-like odor, and yield, when saponified and heated with magnesium acetate, a body which melts at 62° C., and exhibits the composition of palmitic acid—$C_{16}H_{32}O_2$.

Cherry Wood Again in Demand.—Those to whom fifty years is a memory readily recall the cherrywood tables, bureaus, drawer chests that were then in fashion, when the more gaudy and more costly mahogany had but lately come in. It is an evidence of a return to good taste that the wood of the cherry tree is again in favor, not only as it exists in old furniture, but in its new requirements. It is largely used in cases for musical instruments—melodeons and organs—and in furniture—chairs and tables—after being "ebonized," or blackened by acids and dyes. But it is also coming again into use in its natural color. One of the finest banking houses in the Eastern States is finished entirely in cherry, and it is beautiful. The wood, filled and not varnished, has a soft glow not possessed by any other, and has none of those distortions of grain that are so unpleasant in mahogany. The timber is chosen from the wild cherry, which in New England and the North generally does not usually grow to a girth of more than 20 inches, but in some of the Western States and in the South frequently attains a diameter of 24 inches. The domestic fruit cherry gives some good specimens of small timber, but as the tree is rarely sacrificed until it is past bearing and is decayed, this source of supply is precarious. Like all close-grained timber, the best specimens are those which grow singly in exposed situations and not in a dense forest. The facility with which cherry can be worked makes it a favorite with the cabinet-maker. *Ex.*

Postal Notes.—It is only a month before the public will have the new postal notes, the limit of their preparation being September third. They will prove to be a great convenience, as the sender can transmit any sum from one cent to five dollars. The New York *Tribune* illustrates the convenience of the new arrangement by stating that "a lady living out of town who wants to send $3.79 to a dry goods store in New York, will hand that sum, and three cents fee, to the postmaster. He will give her an order with the figure three punched in the dollar column, the figure seven in the column of dimes, and the figure nine in the column of cents. This is simple and easy, and offers no chance for fraud."

Scientific Buffoonery.—Some scientists seem to delight in doing what is calculated to shock the sensibilities of the unlearned, even going so far in some cases that their own sensibilities must be pretty well tested. For example, M. Paul Bert not long ago entertained a party of friends with crocodile steaks, and Dr. Hermes, director of the aquarium at Berlin, feasted his confreres on the eggs of a snake, a huge python recently received from India. How much better for humanity would it be if these men of science, whose fame and influence are world-wide, would set an example of sobriety, and exhibit some experiments illustrating the advantages of simplicity of diet, instead of seeking to startle the world by such repulsive exhibitions! —*Herald of Health.*

Gold Waste in Jewelers' Shops.—A pine floor laid in a gold-worker's shop in ten years becomes worth $150 per foot. A Syracuse jeweler once bought for less than $50 some sweepings that gave $208 worth of gold. A tub in his cellar, into which is blown the dust of a polishing lathe, accumulates $50 a year. A workman in his shop carried off on the tip of his moistened fingers $30 of filings in a few weeks. Workmen sometimes oil their hair, and then run their fingers through it, leaving a deposit of gold particles, which they afterward wash out.

Good Health.

Importance of Ventilation.

One of the great evils arising from the aggregation of large numbers of people, as in cities, is the vitiation of the air in the halls, rooms, closets and cellars of our dwellings. Thousands of people are carried off annually from the entrance of such gases into our houses, and its unnecessary retention there in consequence of imperfect ventilation.

Of course no gas will rise from the sewer into our homes except it be enough lighter than air to force its way up, and often through the best constructed traps. It rises to the highest part of our halls and rooms, above the windows even, if open. By contact with air—it may in some cases be warmer or colder, moister or drier—a heavy resultant is precipitated to the bottom of our rooms. If our rooms are not ventilated at the bottom, the accumulating heavy gases, the most deadly of all, gradually fill the space upward until it reaches the height of our beds, the heads of our little ones, and finally the nostrils of adults, before it reaches an opening in the wall; while if there was a ventilator near the floor, or an opening under the door, it would flow off without rising under the same law as water flows, and without injury to the human system.

True Principles of Ventilation.

Let no one rest in a room closed at the bottom, no matter how open at the top, and consider the place well ventilated. The breath that leaves our bodies, like the light sewer gas, rises upward, and in contact with cool air, falls in part as a heavy gas to the floor, and will finally contaminate the air up to the point of ventilation before it can flow off, under the same law that a tumbler holds all the water poured into it until the fluid reaches the top. Another point, your breath rises above you in a room, and no fresh air from without can reach your nostrils from an opening above without passing through and mixing with air already contaminated with your exhalations.

Now, if an opening is made below the hight of the head, whether we are reclining or standing, the coolest air always entering at the lowest point will supply our nostrils with the purest atmosphere.

If no opening is made at the top, of course our exhalations, lighter than air, rise above us, and no matter how open our room may be at the bottom, they are held in the same manner that light gases are held in an inverted vessel.

If there is an opening at the top as well for all impure air to pass off before becoming cool and heavy, the fresh air coming in below the point of breathing will be as fresh and pure as that outside. In a cold or windy climate, those who are delicate should carefully experiment as to the amount of opening which is best for themselves at both top and bottom, always remembering, however, that the nearer the extreme top the upper openings are made, the more perfect will be the ventilation. In some cases it will be well to commence with moderate ventilation and increase gradually as one becomes accustomed to it until the most desirable amount is reached, which may be different, according to conditions, with different persons.

Those who have children or invalids in their care, who need older and stronger minds to act for them, should not pass the matter of ventilation lightly by as of little importance, because in their own strength, or other fortunate circumstances, they have hitherto prospered without giving it thought or attention.

Those who are growing old and feeble may add much to their strength, comfort and length of days by careful and well-regulated ventilation.

Keepers of hotels, and health resorts especially, may add much to their profit by so arranging the ventilation of their rooms that guests will rest themselves into good humor and health, to the liking of the establishment, and the praise of the climate and everything pertaining to the comfort and health of the place.

There are many landlords and landladies in California, who, through both ignorance and indifference, are killing scores of inmates, simply by not conveniently providing the means of ventilating their rooms at both the top and bottom, when only one "almighty dollar" would pay for the entire alteration necessary for good ventilation. They are not only slowly and surely destroying their patrons, but making victims for doctors who do not believe in ventilation.

Oakland, August, 1883.

Poisonous Honey.—Few people know that in bad seasons honey is apt to be poisonous. This arises from the fact that in such seasons the bees are obliged to gather it from poisonous flowers. Great care should be taken to remove all poisonous plants from the neighborhood of the hives. A specimen of honey from Trebizond, gathered from the *rhododendron ponticum*, which is common in that neighborhood, was sent in 1834, by Mr. Keith E. Abbott, to the Zoological Society in London, and in 1859 it still retained its poisonous qualities. In 1796 a great many people in Philadelphia died from eating honey gathered from the flowers of the *kalmia latifolia*. In good seasons the bees avoid poisonous herbs.

Neuralgia as a "Warning."—One of the London medical journals declares that the great prevalence of neuralgia—or what commonly goes by that name—should be regarded as a warning indicative of a low condition of health, which must necessarily render its subjects peculiarly susceptible to the invasion of diseases of an aggressive type. It is always essential that the vital forces should be vigorous, and the nerve-power in especial in full development; but neuralgia indicates a low, depressed state of vitality—a poor and weak state—and should be promptly placed under treatment.

Barley.—Barley is a very nutritious article of food and easily digested. The American grain is richer in starch than the European. Some samples contain as much as 69 parts of starch in 100, with 45 parts of albuminoids, 3 to 4 parts of mineral matter, and over one part of phosphoric acid. Ground into a fine flour and mixed with one-third its weight of equally fine oatmeal flour to improve the taste, and we have an article for gruels for the sick excelled by nothing else, and far superior in every respect to beef tea.

Noises in the Ear.—The most unpleasant accompaniment of disease of the ear is sometimes so distressing that the patient is rendered almost frantic. Indeed, cases of insanity have been traced to this cause alone. Some cases may be relieved by simple inflation of the ear, which may be done by grasping the nose with the thumb and forefinger in such a way as to close it completely, closing the mouth, and then making an effort to expel the air through the nose. This should not be repeated oftener than two or three times a week.

Hot Water Bottles.—For many purposes dry heat is better than moist, as for warming the feet or hands, and in many cases of neuralgia. Water cools more slowly than most solid substances, and hence a bottle filled with water will retain its heat a long time. The water may be made to retain its heat still longer by adding salt. A still better fluid is a solution of acetate of soda, which may be made by dissolving ordinary baking soda in strong vinegar as long as effervescence continues.

Granulated Eyelids.—We have found the hot spray applied to the eye one of the most useful of all means of treating this disease. If a spray apparatus is not at hand, simply laving the eye with water as hot as can be borne without inconvenience may be employed. The application should be made daily for several months, as this disease is one which requires months, and in some cases years, for its successful treatment.

Saturday Morning, Aug. 25, 1883.

TABLE OF CONTENTS.

EDITORIALS.—The Nichols Furnace; Copper; New Ore Feeder, 113. Passing Events; Sulphur, 120. Blasting in Mines; The Mineral Exposition, 121.

ILLUSTRATIONS.—The Nichols Smelting Furnace, 113. Section and Plan Showing Bore Holes for Blasting, 121.

CORRESPONDENCE.—Arizona Mining; Columbus District, Nevada, 114.

MECHANICAL PROGRESS.—Machine Foundations; The Properties of Oils; Proper Size of Grate-Bars; Copper for Roofing, 115.

SCIENTIFIC PROGRESS.—The Conservation of Solar Energy; Artificial Production; Peroxide of Hydrogen; Deep Sea Explorations; Nitrogen Selenide; Cooling Dwellings in Summer; The Art Which Produces a Cabbage, 115.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 116.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 116-7.

THE ENGINEER.—Aerial Navigation; A Gigantic Dock Enterprise; Over the Ocean on Wheels, 119.

USEFUL INFORMATION.—Horseshoes; Asphalt as Fuel; Oily Substances in Rice; Cherry Wood Again in Demand; Postal Notes; Scientific Buffoonery; Gold Waste in Jewelers' Shops, 119.

GOOD HEALTH.—Importance of Ventilation; Poisonous Honey; Neuralgia as a Warning; Barley; Noises in the Ear; Hot Water Bottles; Granulated Eyelids, 119.

MISCELLANEOUS.—Working Placer Mines where Water is Scarce; Idaho Coal Fields; Raising Coal from Deep Shafts; A New Kind of Quartz Mill at Grizzly; Pioneers of the Comstock; Oregon Copper; Washington Territory Iron, 118.

NEWS IN BRIEF—On page 124 and other pages.

Passing Events.

The city is in holiday attire, and business is carried on just at present only in a feeble way, as so much attention is paid to the processions, receptions, and various festivities of the visiting Knights Templar. It would take more space than our columns afford simply to enumerate the various occurrences in this connection. Suffice it to say California's noted hospitality is recognized and appreciated, and all that can be done has been and is being done for the entertainment of our visitors.

News from the mines is uninteresting as far as special events are concerned, except the news of the important find of ore at the greatest depth in Eureka district, Nevada. At the new Locan shaft on the Eureka Con., which cost, with its machinery, $700,000 and three years' work, now at a depth of 166 feet below the lowest workings on the old mine, $40 ore has been struck, and splendid results are anticipated. This is a highly important strike for the "Base Range."

A complete copper furnace plant of the character described in another column of this week's PRESS has been furnished to the Southwestern reduction works, Ivanhoe, N. M., John Magruder, manager; Cochise Copper Co., Peabody, Arizona, F. F. Thomas manager. There are also two furnaces forty two inches in diameter in operation at the San Pedro mine, N. M.

IN our foundry notes last week we inadvertantly spoke of the improved Cranston hydraulic elevator as being in use at Cherokee, Butte Co., instead of at Yreka, Siskiyou Co., where there is a fine one giving satisfaction.

THE settlement along Wood River exteuds to fifteen miles below Hailey, where the river passes through a canyon in the table lands some five miles before reaching another valley.

Sulphur.

Its Occurrence and Production on the Pacific Coast.

Deposits of sulphur abound in many parts of the Pacific States and Territories; the mineral being, in some instances, abundant and quite pure, and in others quite the reverse. The most extensive and valuable deposits of sulphur yet found in this region of country is that of Rabbit Hole Springs, Humboldt county, Nevada, though the first discovered and worked is situated near Clear Lake, in California, where a refinery having a capacity of six tons per day was erected and commenced operations in 1864.

The sulphur here occurs in a decomposed extensively fissured volcanic rock. Through the orifices, steam and sulphurious vapors issuing, deposit the mineral near the cooler surface, where it is found intermixed with earth, silica, foreign matter in proportions varying from 10 to 35 per cent. Solfataric action is still going on in the neighborhood, the water in some of the springs bubbling with intense heat and noxious gases issuing abundantly from the fissured rocks.

A curious feature of this deposit consists in the occurrence of cinnabar, a notable percentage of which is found associated with the sulphur. The crude material here having been shoveled into wheelbarrows, was carried out and thrown into a furnace and there heated. Passing from this furnace into a receiver and then into large iron kettles where it was purified, the liquid mineral flowed into wooden molds, in which it became solidified and was then ready for market.

In five or six years the quantity of sulphur turned out here amounts to several hundred tons annually. Though an article highly acceptable to the trade was produced, the proprietors of these works were finally obliged to suspend operations, owing to the low prices at which foreign sulphur could be laid down in San Francisco.

Two miles from the locality above described, on an elevation known as "Chalk Mountain," occurs another deposit of sulphur of large superficial dimension, though nothing is known as to its depth. The rocks here, also extremely fissured, have been much decomposed by the action of steam and acid vapors, giving them a chalky appearence. Nothing has ever been done with this deposit.

Sulphur at Rabbit Hole Springs.

The more valuable portion of these beds belong to the Humboldt Sulphur Co. They are about thirty miles northwest of Humboldt station on the C. P. R. R. Though not yet much explored, these beds are known to be very extensive, several large bodies of high-grade mineral having been opened up, and surface indications of a promising nature being met with over an area of several hundred acres. At several points bodies of nearly pure mineral 200 feet long, from thirty to forty feet wide, and of unknown depth have been developed.

The sulphur here occurs in strata reposing under a thin layer of ashy-like earth, which, being scraped away, exposes in many places great masses of brimstone, so solid that some force is required to break it out. Large pieces are sometimes quarried here. A block weighing 1,200 pounds was taken out and started for the Centennial expositiou, but in reaching the railroad was broken in pieces while being hoisted into a car.

In 1865, this company put up works on the ground for beneficiating the crude material, having previously shipped considerable quantities of selected mineral to San Francisco. At these works, which have a daily capacity of twenty tons, steam is employed for melting and refining purposes. The output of these works since being started has averaged about 1,200 tons per year, though much more could have been made had inducements offered. The company employs twenty men, all white, at three dollars per day and found, their operations continuing the year round without intermission.

While most of the sulphur made here has found a market in San Francisco, some has been disposed of to the reduction works and acid factories in Nevada. The Humboldt company have expended on their property between $60,000 and $70,000. The deposits of this company being situated in a barren and timberless country thirty miles from the railroad, the cost of these improvements, as well as current expenditures, has been large. They have been obliged to import nearly everything, fuel included, at heavy expense. Wagon transportation across the desert proving a burdensome item, the company, hoping to lighten the same, had recourse several years since to a steam wagon for performing the service. The experiment, which was attended with a heavy outlay, was a failure.

Notwithstanding the cost of producing sulphur at the above locality is so very considerable, this article could still be made there at a profit were the manufacturers all to keep the entire home market. This company could afford to supply the entire wants of this coast at the average rates that have obtained for the past two years, say $40 per ton, could such prices he assured them. As soon, however, as prices so appreciate that the home producer begins to ship freely, the foreign importer offers his stock at figures ruinous to the former, driving him out of the market, or forcing him to sell at a loss. With his rival out of the field, or so crippled that he is no longer formidable, the importer advances prices to the old standard. But, despite these sharp practices, sulphur on the Pacific coast, like borax, salt and some other commodities, has been greatly cheapened through importers having been forced to compete with the home producer.

In Various Other Localities

Throughout the extreme West sulphur has been met with in such quantity as to attract notice, and sometimes lead to attempts being made towards utilizing the same. Ten miles north of Humboldt salt marsh, in Churchill county, Nev., is a sulphur-bearing bed covering some thirty acres. Some of the mineral here is solid and quite pure, though the most of that on the surface is mixed with a large percentage of earth and other impurities. Holes sunk to the depth of a few feet at different points on this tract indicate large deposits below. With such slight prospecting, however, nothing positive can be affirmed in regard to either their extent or fertility. In the center of this tract occurs a crater-like depression, whence a strong odor of sulphur is emitted. As the locality is far from the railroads, difficult of access, and the country around exceedingly barren, and but little inhabited, this deposit is likely to remain for a long time neglected.

One mile and a half to the westward of that remarkable group of thermals known as Steamboat springs, in Washoe county, Nevada, occurs a sulphur-containing belt composed of a light colored formation resembling chalk or steatite and underlaid by magnesian limestone, traversed by small veins of iron and other minerals. Imbedded in this formation are numerous small strata of sulphur, some of it quite pure, though the major portion is largely mixed with impurities.

A good deal of labor has been expended here without remunerative results, the method of exploiting these deposits having been by shafts and open cuts, through which the sulphur was removed. Though located within a mile and a half of the Virginia and Truckee railroad, and otherwise favorably situated, no work has been done in these mines for several years past, the cost of collecting the crude material having been too great and its grade too low to warrant a continuance of operation.

Near the Fish Lake Valley marsh, Esmeralda, in the same State, is a bed of sulphur, apparently of considerable extent; but as it has never been worked, or even carefully examined, little more is known about it than the mere fact of its existence. Between Coso and Little Owens lake, in Inyo county, Cal., is a group of springs having the form of miniature mud volcanoes, about which occur deposits of sulphur, some of the surface exposure being quite pure. How much of the mineral there is below, or what may be its quality, has not been ascertained, but little work having ever been done here. In the foothills of the Coast range, at a point about thirty miles westerly from the town of Colusa, are sulphur beds of moderate extent and richness. A refinery was put up here in the early history of this industry, but the enterprise, for reasons already mentioned, came to an end after a short and profitless career. There are deposits of this mineral in the Azuere mountains, Ventura county, but their value remains undetermined.

Consumption of Sulphur on the Coast.

The consumption of sulphur here, like that of salt, is comparatively large, having amounted for the past ten or twelve years to as much as 3,500 tons per annum. Most of this is consumed by acid factories. A good deal is used on the vines in California, some by the powder works, there being also the usual requirements of druggists and manufacturers and miscellaneous consumers to be met.

The two principal acid works in California—the Judson acid works and the Golden City—use up annually in the manufacture of sulphuric acid about 1,000 tons of sulphur each; the three smaller acid works in California and one in Nevada use up perhaps one-fourth as much. With the exception of about 1,000 tons produced by the Humboldt company, the supply of this substance is obtained from Sicily, with an occasional cargo from Japan. Before any sulphur was produced on the Pacific coast the price of the refined article was maintained at about $50 per ton. Since sulphur begun to be manufactured here the price has seldom exceeded $40, and has much of the time been as low as $35 per ton. But for importations from abroad enough of this commodity to satisfy all demands could be produced at home. The duty on flour of sulphur amounts to $20 per ton with 15 per cent ad valorem added; on refined sulphur $10 per ton, the crude article being admitted free. Of this tariff the domestic manufacturers would make no complaint, but they say that large quantities of the refined articles are brought into the country under the name of crude sulphurs, thereby defrauding the Government of its dues, and the manufacturer of the protection he needs.

The cost of transportation from the deposits of the Humboldt company from San Francisco amounts to over $20 per ton. It reduces the profit or the product of their works to a narrow margin. As English ships coming to San Francisco to load with wheat bring the Sicily sulphur at very low rates, the market is always kept well supplied from that quarter. Some ten years ago small importations began to be made from Japan which it was then thought might become a prolific and reliable source of supply. Such, however, it has not turned out to be, shipments thence having been estimated on quantity, and arriving at such long and uncertain intervals as have precluded buyers from depending upon them.

LEAKY TUBES.—The proper way to plug up a leaky tube in a marine boiler is thus described by Edwards in the "Catechism of the Marine Engine:" Suppose the tube is 3 inches in diameter and 7 feet long. You take two white pine plugs 3 inches in diameter, tapering off to 2⅞ inches, and about 4 inches long. Next, bore a three-fourths inch hole through the center of the plug. Take a five-eighths inch bar, 7 feet, 4 inches long, with a thread cut 2 inches in length on each end. Run the bar through the tube, put in the pine plugs, and drive them in flush with the tube. Place a saucer-shaped washer filled with red lead, putty, or boiler-maker's cement, on each plug, and screw up tight with nuts. Iron plugs are sometimes used instead of wooden ones, but they are inferior to dry white pine plugs, for the reason that when the pine plugs become saturated with the hot water, which they do in a short time after insertion, they swell, and make a perfectly tight joint, whereas iron does not.

MINT DIRECTOR BURCHARD gives the product in precious metals of Silver Bow county, Montana, for the calendar year 1882, at $3,740,000, and for the Territory at $6,620,000. This is a very satisfactory gain upon the preceding year's product, which was given: Gold, $2,330,000; silver, $2,630,000; base metals, $1,090,000; total, $6,050,000. These figures bear testimony to the steady advance being made in the mining industry of the Territory, and prove that Silver Bow is the banner county of the Territory.

THE Silver Belt mine, Big Bug district, Arizona, is still in bonanza. From 30 to 35 men are employed in and around the mine. An average of 120 tons a month is being shipped to Pueblo, Colorado, for treatment. Ore goes via the A. P. railroad. The rock is rich, easy to work and should be treated at home.

THE ten-ton shipment of silver nuggets and rich ore from the Pine Spring mine ought to open the eyes of San Franciscans. It will be in the city in about twelve days, and we respectfully ask the doubting Thomases to examine the lot.—*Prescott Courier.*

A PARTY of engineers are engaged in surveying and prospecting for a route through Kern county for a narrow-gauge railroad, proposed to be built with a double track from San Francisco to Boston, by the People's narrow-gauge railroad company.

Specimens of sulphur are shown in the California State Mining Bureau from the following places in Nevada: Steamboat springs, Washoe Co., Smoky valley and Humboldt.

Blasting in Mines—No. 5.

Conditions of Disruption—Continued.

To show how these principles are applied in practice, we will take a typical case of a heading, seven feet by nine feet, as shown in Fig. 1. In this case we have at starting only one exposed face, which is perpendicular to the direction of the driving. Hence it is evident that we shall have to proceed by angling the holes. We might begin in any part of the exposed face; but, as it will hereafter appear, the most favorable position is the center. We therefore begin at this point by boring the series of holes numbered 1 on the drawings. These holes are angled towards each other; that is, the two sets of three holes vertically above each other converge in the direction of their lower ends, as shown in the sectional plan (Fig. 2). In this instance we have assumed six holes as necessary and sufficient. But it is obvious that the number of holes, as well as their distance apart horizontally, will be determined by their depth, the tenacity of the rock, and the strength of the explosive used. When these holes are fired, a wedge-shaped portion of the rock will be forced out, and this result will be more effectually and certainly obtained if the charges be fixed simultaneously. The removal of this portion of the rock is called "taking out the key." The effect of removing this key is to leave the surrounding rock unsupported on the side towards the center; that is, another exposed face is formed at right angles, or nearly at right angles, to the first.

Having thus unkeyed the rock by the removal of this portion from the center, it will evidently be unnecessary, except for convenience, to angle any more of the shot-holes. The second series, therefore (numbered 2 on the drawings), may be bored perpendicularly to the face of the heading. When this series is fired, the lines of rupture will all run to the unsupported face in the center, and from hole to hole, if the shots be fired simultaneously, and the annular portion of rock included between the dotted lines 1 and 2 will be removed. If the shots be fired successively, the first will act under the condition of one unsupported face; but as another unsupported face will be formed by the removal of the rock in front of this charge, the succeeding shots will be subject to more favorable condition. The firing of this second series of shots still leaves the surrounding rock unsupported towards the center, and consequently the same conditions will exist for the third series (numbered 3 on the drawings), the firing of which series will complete the excavation.

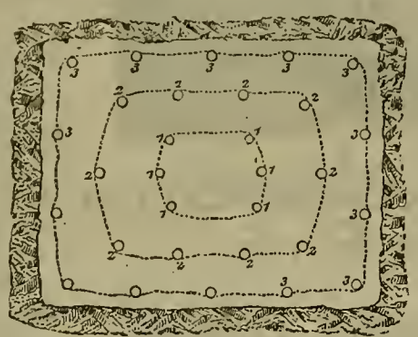

Fig. 1.

Fig. 2.

Fig. 4.

Fig. 3.

SECTION AND PLAN SHOWING BORE HOLES FOR BLASTING.

The longitudinal sectional elevations given in the drawings show clearly the position of the charges relatively to the unsupported faces of the rock. The plans are shown in Figs. 2, 3 and 4, where the holes corresponding to the letters in Fig. 1 are shown. These are from "Andre's Coal Mining."

It may be remarked here that, owing to the want of homogeneity in the rock, and to the existence of joints and fissures, in practice, the outer line of rupture will not run so regularly as indicated, in this assumed case, by the dotted lines. This circumstance will influence the position of the holes in the next series, and furnish an opportunity for the exercise of judgment on the part of the blaster.

There exist, also, other circumstances which will influence the position and the number of the holes in a very important degree, and which therefore must be taken fully into account at every advance. One of these is the irregularity of the face of the excavation. Instead of forming an unbroken plane at right angles to the direction of the heading or the shaft, this face is broken up by projecting masses and more or less deep depressions. Obviously these protuberances and cavities will influence, in no inconsiderable degree, the lines of least resistance, the latter being lengthened or shortened, or changed in direction by the presence of the former, which give existence to unsupported faces to which the lines may radiate. These conditions must in every case be taken into account when determining the best position for the bore-hole. Of yet greater importance is the existence of joint planes and bedding planes. It will be evident, from a consideration of the nature and mode of occurrence of these planes as described in the first chapter of this work, that they may constitute unsupported faces to which the lines of rupture may run. A bed of rock may be, and frequently is, cut up by these planes into detached blocks of greater or less dimensions, according to the more or less perfect development of the different sets. Hence it becomes necessary, in determining a suitable position for the blasting charge, to consider such planes as unsupported faces, and to ascertain the direction and the length of the lines of least resistence under such conditions. If a charge be placed in close proximity to one of these planes, not only may the lines of rupture run in unforseen directions, but the greater part of the force of the explosion will be lost by the escape of the gases along the plane. The same loss of force may be occasioned by the presence of a cavity, such as are of frequent occurrence in cellular or vughy rock. When the joint planes are fully developed, their existence can be ascertained by inspection; but when their development is imperfect, there may be considerable difficulty in discovering them. In such cases the rock should be carefully inspected, and sounded with a hammer or pick. When a cavity is bored into, it should be rammed full of clay, and the boring continued through the clay; or if sufficient depth has been obtained, the charge may be placed upon the clay, which will prevent the wasteful dissipation of the gases. As none of the aforementioned circumstances recur under precisely similar conditions, no general rules of much service can be laid down; they are matters upon which the blaster must be left to use his own judgment; and to do this effectively, it is obviously necessary that he possess some knowledge of the materials with which he deals.

A somewhat different mode of unkeying the face is occasionally adopted when the nitroglycerine compounds are employed as the explosive substance. In such cases, instead of angling the holes in the center of the face, these are bored, three or four in number, close together. When fired with a charge of the strong explosive, the thin partitions of the rock between the holes, and the rock immediately surrounding these to a slight depth, are crushed to dust by the force of the explosion, leaving a large hole in the center of the face, to serve as the cavity caused by the removal of the key in the former case. The relatively small diameter of the hole, however, affords a less extent of unsupported face than the cavity, and for this reason, as well as that of the small useful effect produced by these first charges, the method must be considered as wasteful of explosive material. The only justification for its adoption is to be found in the increased convenience of execution afforded by the perpendicular direction of the holes, in certain circumstances, when machine drills are used.

The Mineral Exposition.

A Creditable Display at the State Mining Bureau.

Notwithstanding the difficulties under which the State Mineralogist labored in preparing for a special display of minerals during the Conclave, he has succeeded beyond his expectations in getting together a collection which is admired by all who see it. The attendance has been very large and the visitors appreciative. To very many of them the whole mineral display is entirely novel, and they see many things never before examined.

There are some 87 cases altogether, and there are tables through the center and down the sides of the main room for the larger specimens that may be handled. Aside from the minerals there are many other things worthy of examination and which attract attention. A number of persons who have visited the rooms declare the exhibition of minerals to be much ahead of that at Denver last year. While there, there were large masses of ore, etc., the variety and excellence was by no means as good.

Taken altogether, the Mining Bureau has done itself credit in affording our visitors so excellent a chance to view our mineral products. California is the most largely represented, as might be expected, and by far the best display of any one county is that of Inyo, which has equal to six cases of minerals—or four cases and a large table. It would be impossible to go into any great detail in a single article like this, but we will endeavor to give, briefly, a sketch of what is shown by the

Counties of this State.

Though many of them are not, by any means, as fully represented as they should be. On a future occasion we shall go more into detail; but what follows will show the variety of our mineral products, and, to some extent, the comparative mineral resources of the counties, which we report in alphabetical order.

Alameda, Alpine and Amador.

Alameda county shows salt, cement, chrome iron, carbonate of magnesia.

Alpine county exhibits enargite, silver ores, and crystallized diallogite, a very rare mineral; also gold ores.

Amador shows gold bearing pyrites, handsome marble, iron ore, gold sands, lonite coal, chrome iron, clays, copper ore, rich gold ore and diatomaceous earth.

Butte, Calaveras, Colusa and Contra Costa.

Butte county has a case for itself and shows a number of very interesting things, among them gold platinum, diamondiferous sands, diamonds both cut and uncut, pyrites, gravel, cement, iron, asbestos, slate, gold amalgam, retorted gold and placer gold. The Spring Valley mine of Cherokee figures largely here.

Calaveras has rich gold ores, limestones, marbles, stalactites, copper ores which are very rich; a "cat's eye" the most beautiful ore ever found in the State; fine iron ores; splendid manganese, yellow ocher and steatite.

Colusa shows very rich copper and gold ores. There is also ore from the curious Sulphur Creek mine, where there are such interesting geological features, and a mine is being manufactured, so to speak. Gold and cinnabar are associated in the ore.

Contra Costa has only copper ores, coal and clays.

Del Norte, El Dorado and Fresno.

Del Norte has a small display of very rich copper ores and mica.

El Dorado exhibits mica, copper, chrome iron, Roscoelite, limestone and marbles, pyrites of iron with gold on the faces, magnetite, clay, talcose slate, gold ores and mispickel.

Fresno has molybdenite, zircon sand, andelusite, steatite, rich gold quartz, chrome iron and cinnabar.

Humboldt, Kern, Lake and Lassen.

Humboldt county has no reputation as a mining county, yet it brings forward gold ores, platinum and actinolite.

Kern county has many rare and beautiful marbles, lithographic stone, kaolin, steatite, gypsum, antimony, silver ores, gold, galena and garnet sands.

Lake county has plenty of cinnabar and sandstone, native sulphur, diatomaceous earth, obsidian clays and ornamental stone.

Lassen county exhibits limestone, lignite, rich gold quartz, etc.

Inyo County.

Inyo county has the best display, as stated, among the counties. It consists principally of gold and silver ores. It is astonishing to think that one county of the State could have within its borders so great a variety of ores. There are specimens from many different mines at different depths. The whole collection is of so much interest that we reserve it for a special description in another issue.

Los Angeles, Marin and Mariposa.

Los Angeles sends up some very handsome pink calcite, gypsum, garnets, vivianite, steatite, erythrite, alum, mica, galena, magnetite, manganese, antimony, copper glance, sederite and diatomaceous earth.

Marin shows some fine steatite, and stone suitable for pavements and building, oxide of manganese, good clay, gasper and copper ores.

Mariposa exhibits gold, building stone in variety, granite, feldspar, quartz crystals, copper, manganese, gold and aluminium.

Mendocino, Monterey and Mono.

From Mendocino are sent gold bearing beach sands, gold platinium, zircons and lignite.

Monterey county shows fine sands for glass making, clays, bituminous shale, gypsum, coal, white marble, crude petroleum and carbonate of magnesia.

Mono county has two cases of its own of very fine minerals principally gold and silver ores from different mines. The display is very creditable and we shall allude to it hereafter more fully.

Napa, Nevada, Placer and Plumas.

Napa shows cinnabar, manganese, iron, silver (?), obsidian, basalt, jasper and gold.

Nevada county is very poorly represented, and it is its own fault. As our leading mining county, its citizens should have taken some interest in the matter. Gold is shown from several mines, gold cement, very fine porcelain clay, iron ores, copper cement, etc. A whole set of products of Spenceville copper mine, illustrating the metallurgy of copper, is shown. Some fine steatite is also exhibited, calcite, manganese, building stone, scheelite, a very rare mineral, and the first ever found in the State; sulphate of baryta, marbles and silicified wood.

Placer county exhibits steatite for fire-proof materials, diorite, granite, good building stones, fine fire clays, marbles, iron, lonite, white sands for glass, magnetite, nickel, copper ore, chrome iron, silicified woods, gold ores in great abundance, free gold, salt water from springs, hydraulic concentrations and crystallized iron.

(Continued on Page 124.)

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, Etc.
Working Tests (Practical) Made.
Plans and Specifications furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO,
(Formerly Huhn & Luckhardt.)
Mining Engineers and Metallurgists

JOHN TAYLOR & CO.

IMPORTERS OF AND DEALERS IN

Assayers' Materials,

MINE and MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.

☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hill also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an Impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weighs 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons In 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING AUGUST 14, 1883.

283,188.—TONGUE SUPPORT—D. C. Ballard, Centerville, M. T.

283,197.—SAW PLATE AND INSERTED SAW TOOTH—J. J. Bowen, S. F.

283,069.—HARROW—Brown & Williams, Roseville, Cal.

283,365.—SASH FASTENER—Fred'k Dudley, Eugene City, Or.

283,221.—SAW HANDLE—Jas. N. Dudley, Petrolia, Cal.

283,335.—HASP LOCK—J. C. Franklin, Lena, Or.

283,095.—BAG SEWING MACHINE—H. P. Garland, San Quentin, Cal.

282,983.—STEP-LADDER AND HOIST—E. D. Haven, Albany, Or.

282,985.—FLUID METER—F. G. Hesse, Oakland, Cal.

283,112.—CAN HOLDER—Ivey & Uren, Seattle, W. T.

283,252.—SEAM FOR UNITING PIECES OF LEATHER—Quan Kai, S. F.

283,349.—CHRONOMETER ESCAPEMENT—A. W. Kientoff, Dalles, Or.

283,257.—COMPOUND PUMP—H. C. Langrehr, S. F.

283,120.—SAFE—Lauth & Hardy, S. F.

283,128.—LOCK HINGE—E. E. Masters, Woodland, Cal.

283,300.—HYDRAULIC PILE DRIVER—Surprenant & Ferguson, Astoria, Or.

283,180.—ORE FEEDER—Wm. E. Wild, S. F.

10,518.—TRADE MARK—J. R. Williams, Stockton, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Pateut Agency, the following are worthy of special mention:

SAFE.—John N. Lauth, Howard, Center Co., Penn., and Orlando B. Hardy, S. F. No. 283,120. Dated Aug. 14, 1883. A chamber is formed in the earth below the surface and surrounded by masonry, or other suitable substance of considerable thickness. It is preferred to build within this structure chilled iron plates, so as to make it entirely burglar-proof if the masonry should be partly dug away, while the masonry will be sufficient to make it fire-proof. This chamber is sufficicutly large to receive the safe, which is exactly fitted to it, and may he lowered into it or raised above the surface. The safe may be made comparatively light and have doors on more thau oue side, so its contents may be easily reached without the necessity of standing room withiu it. The safe may all be made of comparatively thin material except the top, which is heavy and thick. When the safe is lowered iuto the chamber it will he as nearly fire and burglar-proof as possihle. It is raised by hydraulic or other pressures.

HARROW.—Timothy S. Brown and George Williams, Roseville, Placer Co., Cal. No. 283,069. August 14, 1883. This inprovement in harrows consists in the construction of the tooth-bolding bars, their shape, the means for receiving the teeth, and the braces and other details of construction. They inteud to couple several sections together, aud hy reason of their side bend, make the entire device cover appreciably more ground than it would if it were straight. The sections, beiug light, may be thus increased and a very effective implement provided.

LOCK HINGE.—Egbert E. Masters, Woodland, Yolo Co. No. 283,128. Dated Aug. 14, 1883. These improvements in lock hinges are in the pawl and rachet mechanism by which it operates. The object is to provide a useful hinge for screen or inside doors, window blinds, gates, etc., which require to be held open temporarily. The door may be kept closed or in any desired positiou.

THE best Spring medicine known is that wonderful tonic, Brown's Iron Bitters.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced and Tulare counties.
JARED C. HOAG—California.
B. W. CROWELL—Colorado, Utah and Montana.
M. H. JOSEPH—Eureka, Nev.
L. M. LEIBY—San Bernardino and San Diego counties.
J. J. BARTELL—Yolo county.
E. P. BILLINGS—San Luis Obispo Co.
REV. S. GOODENOUGH—Santa Clara county.
H. W. FOLSOM—Los Angeles county.
C. E. CURTIS Kern and Inyo counties.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

The Mineral Exposition.

(CONTINUED FROM PAGE 121.)

Plumas shows copper, magnetite, gold quartz and hematite.

Sacramento, San Benito and San Diego.

Sacramento exhibits chrome iron, gneiss, granite, gypsum and hornblende.

San Benito shows stihnite, limestone, magnetite, nickel ore(?) and lignite.

San Diego county has quite a collection. It exhibits gypsum, selenite, copper, diatomaceous earth, pumice stone, chalcedony, gold quartz, copper, magnetite, stalactites from mud volcanoes. The very rare mineral lepidolite and blue calcite.

San Francisco, Sau Bernadino and San Joaquin.

San Francisco county has polished specimens of serpeutine, picrolite, pumice, hydro magnesite, jasper, building stone, and the first fossils found on the peuinsula.

San Bernardino county has cases of its own, and a very attractive and elegant display of Calico and Providence Mountain ores. One of the cases was paid for hy subscription, and the other by Mr. Ewing, of Providence Mountain, a phhlic spirited gentleman. In addition to the ores referred to, there is shown the first nitrate of soda found in the State, natural crystals of borax, copper ore and refined horax.

San Luis Obispo, San Mateo and Santa Barbara.

San Luis Ohispo exhibits mineral waters, dolomite, onyx, petroleum, asphaltum, aurifer-ous pyrites, clays, chrome iron, silver and cinnabar.

San Mateo contrihutes limestone, crude petroleum, zinc blende, huilding stone and chrome iron.

Santa Barbara shows quicksilver, picrolite, gypsum, diatomaceous earth and asphaltum.

Santa Clara, Santa Cruz, Shasta and Sierra.

Santa Clara county exhihits chrome iron, Iceland spar, gypsum, lignite, copper, steatite, sandstones, quicksilver ores, antimony and iron.

Santa Cruz only shows limestones.

Shasta, also, has limestones, copper, magnetite, iron, asbestos, silver and gold.

Sierra has good gold specimens, chrome irou, lead and cement with gold.

Siskiyou, Solano, Sonoma, and Stanislaus.

Siskiyou county exhibits gold, basalt, calcite, platinum, chrome iron, jasper and aragonite.

Solana has in her display the first bloodstone ever found in the State. She has onyx marble, too.

Sonoma shows chrome iron, cinnabar, steatite, actinolite, copper, paint rock, clay, diatomaceous earth, hornhlende, obsidian, graphite, jaspers and mangancse.

Stanislaus shows gypsum and telluride ores.

Tuolumne, Trinity and Tulare.

Neither Tehama nor Sutter counties are represented.

Trinity has cuprite in native copper.

Tulare exhibits silver, iron, steatite, zinc blende, asbestos, rose quartz, copper, stilnite, jeffriesite and silver.

Tuolumne county has one case of its own. In it are marble, magnesite, kaolin, magnetite, sandstone, chalcedony, gold quartz and sulphurets. The gold specimens are mainly from the Soulshy mine, the superintendent of which, John Leechman, paid for the case himself. The Soulsby company gave most of the specimens.

Ventura, Yuba and Yolo.

Ventura county exhibits gold, galena, silver and gypsum. Yuba contributes gold. Yolo has cinnahar, aragonite—which is one of the rarest minerals known—metacinnabarite, gypsum, iron and steatite.

We have not space on this occasion to go into more detail concerning the general exhibit. There are several private collections, each of great interest; cases with fossils and ethnological specimens, flasks and pans of quicksilver, cases of shells, birds and a great quantity of interesting things, descriptions of which we shall reserve for a future number of the PRESS.

A TRUE tonic medicine, a blessing in every household, is Brown's Iron Bitters.

Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting snbscriptions and advertisements for this journal and our other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & Co., Publishers,
No. 252 Market St., S. F.

News in Brief.

THE new cable road on Market street in this city began running on Tuesday.

THERE was a destructive cloudhurst at Silver King, A. T., on Tuesday evening.

DAKOTA, it is thought, will give a yield of over 17,000,000 bushels of grain this year.

THE Arizona and New Mexico road is completed to within five miles of Clifton, A. T.

THE Empress Eugenie has gone to Carlshad. She is breaking down from dyspepsia and depression. An American doctor has been called to attend her.

THREE thousand five hundred tons of machinery material have arrived at Colon for the canal, and they expect twenty-five hundred tons more shortly.

THE members of Plymouth church have unanimously indorsed the proposition to extend the vacation of their pastor, Henry Ward Beecher, so he can lecture.

THE total exports from the United States to South America during the last fiscal year were $23,808,000, as against $46,829,000 from France, and $80,596,000 from England.

THE largest sailing regatta ever held in the world took place off Marblehead Saturday, under the auspices of the Beverly Yacht Club. Of 237 vessels entered, 158 started.

DR. BAYOL writes that he has traversed a large and unexplored tract on the left bank of the Niger, and has placed the whole country as far as Sego under the protection of France.

CASSIMICIOLA is a town on the island of Ischia, which was recently destroyed by an earthquake, is rapidly being rebuilt and already 154 wooden houses have been erected and occupied.

REPORTS of the harvest prospect from all parts of Ireland are very encouraging. In the northern, the midland and southern counties, the crops are full and promising. The potato yield is large.

THE King of Bavaria has ordered a single private performance of "Parsifal" at the opera-house at Munich, with all the original scenery and scenic effects. The King sits alone in a curtained hox unseen. It costs him $12,000.

THE new postal notes will be ready for circulation Septemher 3d next. They are now being secured in books of 500 each, and distrihuted through the registration division of the New York postoffice to the postmasters of the country.

THE Northern Pacific issues a circular that connection will be made 60 miles west of Helena, M, T., by the 25th, and the road will be ready to receive frcight on and after the same date, to and from all points in the Pacific Northwest.

THE mayors of Fargo, Grand Forks, Bismarck, Tower City and Jamestown have signed a call for a eouvention of representative men of the region lying north of the forty-sixth parallel to take measures to protect the interests of northeru Dakota.

THE Londoners have taken to the Thames throughout the summer months, and eat, drink and sleep in what are known as house hoats. These usually contain a snug dining-room and sitting-room combined, two or three small bedrooms, a kitchen, and a veranda.

INFORMATION is wanted at this office of one Joseph Craig, formerly of Cass county, Illinois, who came to California in 1849.

PRINTERS, AUTHORS, INVENTORS, PATENTEES, BUILDERS, MANUFACTURERS, MACHINISTS, MERCHANTS, and other trades-people can have satisfactory Engravings and Electrotypes made at moderate prices by the S. F. ENGRAVING Co., No. 405 KEARNY ST. Send photographs, sketches, drawings, models or samples for estimates. Map and Woodcut Engravings enlarged or reduced by the aid of photography, at less than one-half the cost of the originals and in a short time. Photo-relief, Zincograph and other improved methods employed.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

Stock and Grain Land.

Parties wishing to purchase good stock raising lands, unaffected by severe drouths, will do well to address the undersigned. The lands can be purchased cheap, in lots from 100 to 2,000 acres. It is partly low table and rolling land, partly clear and level. Good for vine and fruit raising. Will raise vegetables and all kinds of grain. Crops certain every year. Near town and a $10,000 public school house. Price, $3 to $5 per acre. Good local market for fruit, vegetables, grain, poultry and dairy produce. Address the proprietor,

EDWARD FRISBIE,
Anderson, Shasta Co., Cal.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

SUFFER

no longer from Dyspepsia, Indigestion, want of Appetite, loss of Strength lack of Energy, Malaria, Intermittent Fevers, &c. BROWN'S IRON BITTERS never fails to cure all these diseases.

Boston, November 26, 1881.
BROWN CHEMICAL CO.
Gentlemen:—For years I have been a great sufferer from Dyspepsia, and could get no relief (having tried everything which was recommended) until, acting on the advice of a friend, who had been benefitted by BROWN'S IRON BITTERS, I tried a bottle, with most surprising results. Previous to taking BROWN'S IRON BITTERS, everything I ate distressed me, and I suffered greatly from a burning sensation in the stomach, which was unbearable. Since taking BROWN'S IRON BITTERS, all my troubles are at an end. Can eat any time without any disagreeable results. I am practically another person. Mrs. W. J. FLYNN,
30 Maverick St., E. Boston.

BROWN'S IRON BITTERS acts like a charm on the digestive organs, removing all dyspeptic symptoms, such as tasting the food, Belching, Heat in the Stomach, Heartburn, etc. The only Iron Preparation that will not blacken the teeth or give headache.

Sold by all Druggists.

Brown Chemical Co.
Baltimore, Md.

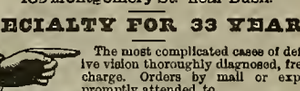
See that all Iron Bitters are made by Brown Chemical Co., Baltimore, and have crossed red lines and trade-mark on wrapper.

BEWARE OF IMITATIONS.

18th Industrial Exhibition
—AND—
Mechanics' Fair
of San Francisco, 1883,
Will Open at the NEW PAVILION on Larkin, Hayes, Polk & Grove Sts.,
—ON—
TUESDAY.....SEPTEMBER 11th
And Continue until October 13th.

This will be the most comprehensive Exposition yet held in this State of Manufactures, Art and Natural Products. A GRAND CONCERT and other extra attractions each afternoon and evening.

PREMIUMS.



A liberal list of Premiums, consisting of Gold, Silver, and Bronze Medals, Diplomas, and Cash, will be awarded to meritorious exhibits.

Members of the Mechanics' Institute, in good standing, are entitled to double and single season tickets at half rates.

Intending exhibitors should lose no time in applying for space.

Full information will be given and sent on application to the Secretary, 31 Post Street.

P. B. CORNWALL, President.
J. H. CULVER, Secretary.

Only "PEBBLE" Establishment.
1863  1883
Muller's Optical Depot,
135 Montgomery St. near Bush.
SPECIALTY FOR 33 YEARS.

The most complicated cases of defective vision thoroughly diagnosed, free of charge. Orders by mail or express promptly attended to.
Compound Astigmatic Lenses Mounted to Order. Two Hours Notice.
Dewey & Co. { 252 Market st. } Patent Agt's.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Pateuts and Assignments; Every legitimate branch of Paten Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru-Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Swoden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queenslautl, Tasmania, Brazil, New Granada, Chile, Argentino Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our ageucy. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for pateuts can rest assured that their communications and busiuess transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to savo our patrous the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of pateuts or purchasers of patented articles, cau often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happeued that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

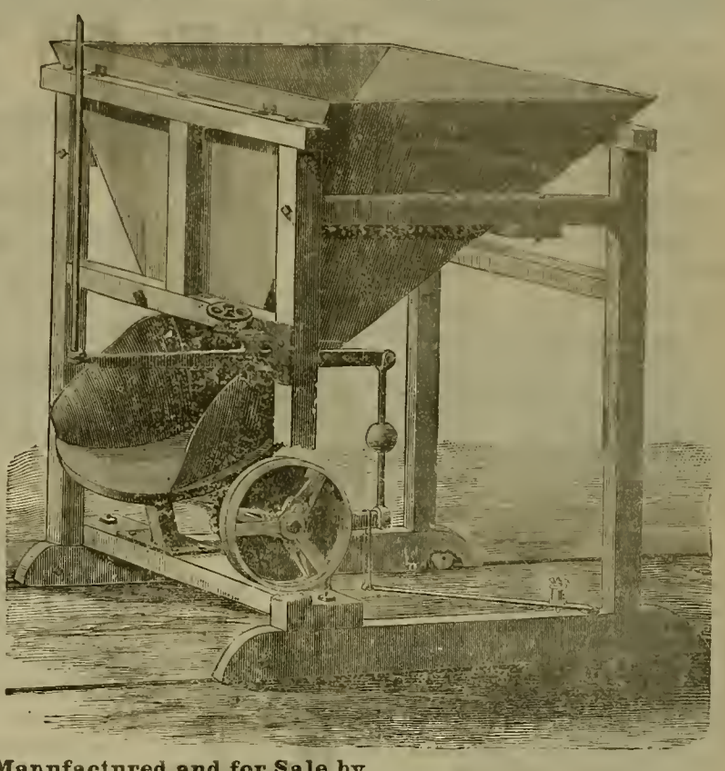
United States and Foreign Patent Agents, publishers Mining and Scientific Press and Pacific Rural Press, 252 Markct Street. Elevator, 12 Front St., S. F.

"Challenge" Ore Feeders.

OVER 1100 HAVE BEEN IN SUCCESSFUL OPERATION.

Awarded First Premiums at the Preceding and last Industrial Fairs of the Mechanics' Institute of San Francisco.

TWENTY PER CENT. MORE ORE CRUSHED WITH FIFTEEN PER CENT. LESS WEAR OF IRON THAN BY THE OLD METHOD OF HAND-FEEDING.



The opposite cut illustrates the recently-introduced Gripand-Boring Attachment, which replaces the Weight originally used and result in an obvious improvement.

The practical operation of the large number of these machines now in use demonstrates the fact that the principle upon which a perfect Ore Feeder must be constructed is that of a *carrier* and not that of a shaking table. Uniform feeding is impossible upon the latter plan. The ore must be *evenly carried* upon a steadily advancing platform table to the line of point of discharge, and there be simply dropped. Jerky or spasmodically acting contrivances will not answer the purpose for feeding wet or sticky ores, nor for the ores of mines where they may change from sharp quartz to an intensely tough material of quartz and earthy matter.

The Feeders are in Successful Practical Operation in the Following Quartz Mills, and are giving Perfect Satisfaction to their Managers.

And in many other Mills in the Mining Districts of the entire United States, and as well in Nova Scotia and Australasia. The superiority of these Feeders over others manufactured has been so thoroughly demonstrated that it is not deemed pertinent to cite the numberless instances of this fact.

Manufactured and for Sale by

THE "JOSHUA HENDY MACHINE WORKS,"

Nos. 49 and 51 Fremont Street, San Francisco, Cal.,

Manufacturers of Quartz, Saw Mill and General Machinery. Agents for "BAKER" ROTARY PRESSURE BLOWERS, WILBEARHAM ROTARY PISTON PUMPS, P. BLAISDELL & CO.'S MACHINISTS' TOOLS, and the Celebrated "HOT POLISHED SHAFTING," from the Akron Iron Company, Akron, Ohio. Also Manufacturers of New and Dealers in Second-Hand Boilers, Engines and all Descriptions of Machinery.

CATALOGUE AND PARTICULARS FURNISHED UPON APPLICATION.

Mining Companies.

Persons interested in inco.porations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

San Francisco, August 2, 1883.

At a meeting of the Board of Directors of the above named company held this day, Dividend No. 57, of twenty-five cents (25c.) per share, was declared, payable MONDAY, Aug. 13, 1883, at the Farmers' Loan and Trust Company, in New York, or at the office in this city.

WILLIAM WILLIS, Secretary.

OFFICE—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, Cal.

ASSESSMENT NOTICE.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California; location of works, Drytown, Amador county, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 31st day of July, 1883, an assessment (No. 5) of eight cents (8c.) per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, 523 California St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of September, 1883, will be delinquent and advertised for sale, at public auction, and unless payment is made before, will be sold on Thursday, the 27th day of September, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. MARTIN, Secretary.

OFFICE—Room 6, 523 California Street, San Francisco, California.

COKE. PATENT. COKE.
This COKE is exclusively used by Prof. Thomas Price, in his assay office, by the Selby Smelting and Lead Co., Prescott, Scott & Co., Risdon Iron and Locomotive Works and others in this city. Large supplies are regularly forwarded to consumers in Salt Lake and Nevada, to the Copper Queen Mining Co., Longfellow Copper Mining Co. and other consumers in Arizona.
The undersigned are in receipt of regular supplies from Cardiff, Wales, and offer the COKE for sale in quantities to suit purchasers.

Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.
It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.
While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. SEND FOR CIRCULAR. Address

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

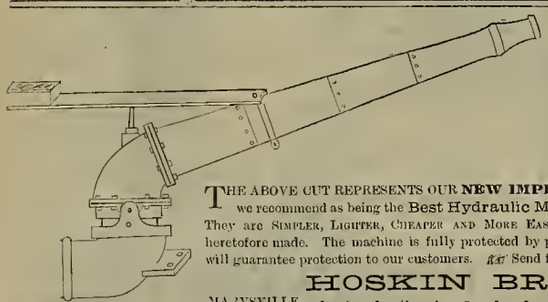
Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

EXCELSIOR BLASTING POWDER,

Manufactured by the



EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro-Glycerine Powder, as safe to use and handle as any other Nitro Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

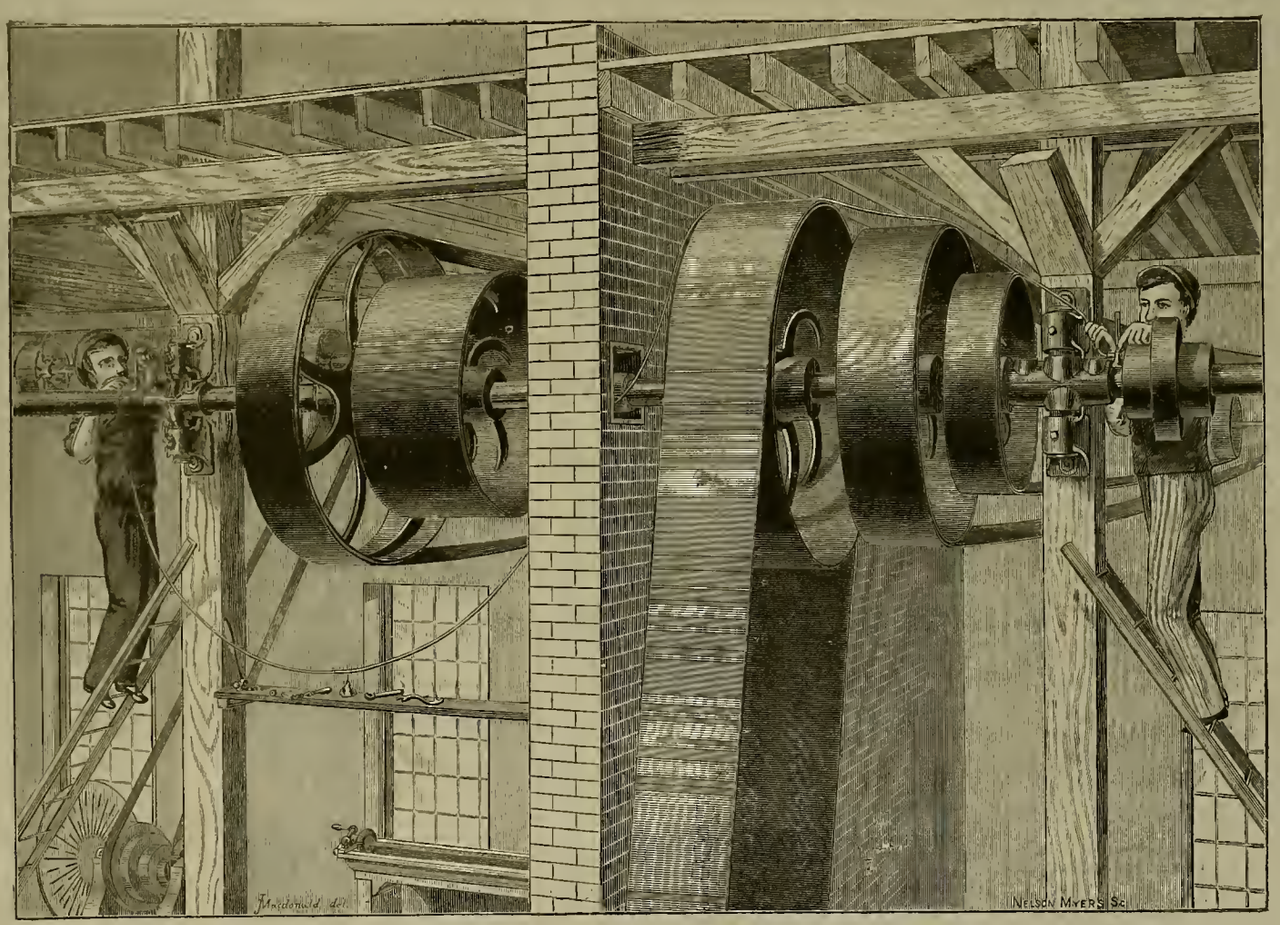
MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.



BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 1, 1883.

VOLUME XLVII Number 9.

Macdonald's Hydrostatic Level.

A device for leveling that will be found very useful, particularly among those who are engaged in the erection of machinery, or have occasion to use a level in cramped and complicated positions, as well as for any other service to which the ordinary spirit level may be put, has lately been perfected and patented by Mr. Jas. Macdonald, of New York City. The cuts on this and page 137 give a clear idea of its application. Fig. 1 is a sectional and

APPLYING MACDONALD'S HYDROSTATIC LEVEL.

Fig. 2 an outside view of a standard, of which there are two for each level. In Fig. 1, A is a brass tube secured to the base B and slotted vertically on opposite sides at F, and as seen in Fig. 2. C is also a brass tube into which the conical valves E E are fitted, and it is slotted vertically, corresponding with A. The glass tube D is held between the valves E E by watertight joints of rubber at J J, and is graduated in thirty seconds of an inch, each quarter being numbered 1, 2, 3, etc., from the bottom; the graduations being placed opposite the slots in C. The upper conical valve contains the screwed cap H and a vent hole G, which, when in the position shown, communicates with the atmosphere through a corresponding hole in A, at the same time the lower valve opens a communication through the arm L, with the rubber hose M, by which the two standards are connected together. These holes or ports are closed by applying the thumb and fingers to the nurled edge of the cap H and turning to the right till the movement is restricted by the stop pin N, in the base B, which extends into a slot in the lower valve E. The tube C and the lower valve E may be separated to give access to the glass by removing the pin I. K is a loose ferrule by which the end of the rubber hose M is held on the arm L and attached to the standard. When in use, the level is kept constantly filled with water to a point about half way up the graduated gauges. The operation of filling may be easily performed by removing the cap H from the standards or by simply opening the valves in each and using the hose as a syphon. The valves E E are so arranged that the operation of screwing the caps in will close them.

The immediate functions of these valves are to prevent the escape of water when the level is not in use, and at the same time to confine whatever air there may be above its surface in the standard, so that it cannot become mixed with, or mechanically suspended in the water in the hose, which, if allowed, would prevent its surfaces from indicating the level. It will be seen that when the valves are closed the scale on the glass tube, which is the only part of it left uncovered, will be carried under the sides of the outer tube A, and be more effectually protected.

When the position of two points relative to a horizontal line is to be determined, a standard is placed on each, the valves E E are opened, which admits the atmosphere, and the water immediately finds its level. The difference in altitude, if any, between the points on which the standards are placed, will be the difference between the points on the graduated gauges at which the water rests. Thus, if 9 was indicated in one gauge and 6 in the other, the former would be three-quarters of an inch below the latter. The same results may be obtained by placing the top of the standard under the points to be leveled. As the basis of the standards are only 2″ in diameter, they may be used in small spaces and cramped positions, a condition that is often met with, especially in line shafting.

The flexible tube may be passed over, around or through any obstructions that there may be between the points to be leveled, and if extra length of hose is wanted it may be added by means of the coupling shown in Fig. 3, which consists of a short grooved nipple, on which the ends of the hose are stretched and held in position by means of the ferrules shown. The workmanship and finish is good in every particular, handsomely nickel-plated, and provided with a suitable case for keeping it in when not in use. Mr. Fred. A. Hodgson, 294 Broadway, New York, is the agent for the United States and Canada.

Kaolin Location.—A ledge formation of what is said to be kaolin has been discovered in the vicinity of Rush creek, two miles northwest of this city, and considerable excitement is being created over the development. A quarter section of land has been located there under the placer mining laws, while other parties have made quartz locations along the ledge for a distance of 6,000 feet. There is a ledge formation of clay varying in thickness from 50 to 80 feet, and inclosed between granite walls. A tunnel has been run into it in one place a distance of 25 feet, and Captain Moore, who worked in potteries in the old country, says the deposit is very valuable.—*Nevada Trans.*

John W. Mackay has been elected President of the Postal Telegraph Company, to fill the vacancy existing since the resignation of Joel B. Erhardt.

CORRESPONDENCE.

From the Southwest.

[From our Own Correspondent.]

From Prescott to Ash Fork is called 50 miles, and by some, 60 miles; the stage fare is $10; and the last 15 miles is so rough and rocky and the stuffing in the cushions, if any, is so very solid that you feel almost sure the seat is made of well-seasoned hard wood.

Mr. Stewart is the general agent, and all the drivers on the line through from Maricopa to Ash Fork seem so very courteous and careful for the comforts of travelers, it must be inferred that all the blame for the hard bumps and bruises must be divided between the road commissioners and the stage proprietor, Mr. Salsbury, of Benson. But the public just now feel wonderfully favorable toward Salsbury, and would say as long as he will drive on the furnace business with his fast increasing facilities to reduce all kinds of ores, and advance the cash on prospectors' samples, as well as on thousands of tons lots, as soon as sampled and assayed, we can excuse him for slight negligence in the matter of cushions in the coaches that are so soon to give place to palace car accommodations. The fashion followed by lady tourists of carrying a large pillow, with a gingham slip buttoned over it, is a very commendable part of stage and car outfit.

Leaving Prescott in a beating thunder storm, I did not occupy my engaged outside seat, and could see but a small portion of the fine scenery that we passed during the afternoon, before night closed in upon us. We could here and there see a very comfortable farm dwelling, painted white, and some small patches of corn and potatoes that were looking well, but the wrinkled corn leaves seemed to say, "want rain." We passed some valuable stock ranges where the water is sufficient and the range very extensive. There are now several from the outside States and Territories looking for stock land. The principal flowing waters are already appropriated, and now more or less digging will generally be necessary to get the required water supply. Once in five or ten years there may occur a very dry season, when both feed and water will be scarce.

The two Great Railroads now Running Across the Territory

Will offer some security for supplying a large amount of both feed and water. The A. and P. R. R. have a large number of tank cars for conveying water to many of their stations where as yet they have failed to get a supply. The stock of Arizona is greatly advanced in value as an investment, from the fact that when a dry year should happen it could be early provided for by importing by railroad some food, and exporting most of the stock in a yet merchantable condition. Those who distinctly remember the trials of journeying over hundreds of miles, and freighting provisions and household necessities and farming tools, can appreciate the advantages of a railroad as others cannot. The people in northern, middle and southern Arizona are today nearer San Francisco, Chicago, New York, or even nearer to Liverpool, than they previously were to Los Angeles or San Diego, their nearest points of supplies. Families and business men of means will not now dread the journey nor hesitate to make a sojourn in Arizona while in such easy nearness to any part of the world with railroad, mail and telegraph.

The Climate of Arizona

Varies much with the altitude, but the average of Arizona climate is very good, the wooded hills very pleasant and healthful. The miners in nearly, if not all of the mines, can work the entire year as far as cold or heat is concerned. I could better appreciate this important feature when I passed directly from the mines of Prescott and experienced the July sunshine on the Colorado river bottom at the Needles, on the border of the California desert. While the usual gauge of the thermometer is about 120°, and some claim a register of 132° in the shade, the thermometer was corroborated by the fact that the butter was melted as thin as olive oil, and handled only with a spoon, and the sand, as well as the lumber exposed to the sun, was too hot for the bathers' feet. Here at the Needles is where the Atlantic and Pacific ends, or rather joins the South Pacific, which, in connection with the Central Pacific, makes a short through route to San Francisco (now only lacking the completion of the bridge across the Colorado river, which is nearly completed). The Atlantic and Pacific begins at Albuquerque, in New Mexico, runs along the 35th parallel over an interesting and new route, although full of evidences of being one of the

Oldest Settled Portions of the Continent.

The cliff dwellers are gone, and left no record except their dwellings under the cliffs of the rocks—neat and well-built stone and mortar walls. These walls have well-shaped stones, square corners, and both sides smooth and even, with corners right-angled. From the measurement of several of these rooms, they seem to have preferred to have them right-angled parallelograms, with the length twice the width, but not at all uniform in size. One room measured was 8½x17 feet, another 5½x11 feet. These may join one to another under the same cliff, but do not communicate one with another by any inside doors. The outside entrance door is small—only large enough to admit a full-grown person; but this opening shows careful, true shaping, straight sides and parallel, but the lower line broken. This door was placed about two and a half feet above the floor. Above the door was a small opening to allow the smoke to escape.

About three miles from Casino station—a pleasant walk over level, rich grazing and sparcely timbered land—we come to an immense gorge in rocky strata, a deep canyon of bare and very

Precipitous Rocky Sides.

The channel more than 1,000 feet below the country level, was now dry, though the well worn rocks spoke of torrents that had rushed through there in very crooked channels. Standing on the edge of this chasm you can count many of these cliff dwellings built under the projecting strata, where a softer strata had fallen out, leaving an opening between the two solid strata. Here they had carefully walled up the front and sides, leaving only room to pass carefully in front to enter their small door. They certainly must have been very sober, for by one misstep they would be precipitated hundreds of feet below on craggy rocks. These lodges could none of them be reached by any direct descent from above, and no rock rolled or sent from above could reach them even when entering their dwellings and yet outside. It takes a good climber when piloted to the right place to make the descent to get to the bottom and then up to any of these dwellings.

No implements of any kind are now found, no inscriptions left. The pieces of pottery which abound may be that of more modern tribes, who may at some time have temporarily occupied these retreats.

There are several localities where are found these cliff dwellings. A correspondent of the Burlington *Hawkeye*, who was along, considered this one of the richest enjoyments of his trip, for he was satisfied that he and the guide, Scotty, climbed to one point where white man's feet had never before been—to an elevated plain and fortification, and probably what had been used as a storage for their provisions.

Game.

We saw no antelope, though they abound, but saw three gangs of wild turkeys; in two of them were broods of young ones.

Ash Fork, where the freight for Prescott is shipped by land schooners or trail wagons, is a P. O. town of perhaps twenty houses and cabins—several good beginnings for mercantile houses. Mr. M. Wood, the principal shipping agent, is an obliging, energetic, reliable business man, and has a large amount of merchandise and mining machinery to forward to different towns and mining camps in Yavapai county. The same amount of business would soon build up a town elsewhere; but here the expectation that a branch railroad will soon be built from this or some more convenient point to Prescott prevents any permanent improvements from being made here. As yet no efforts have succeeded in getting

Water in any of the Wells,

Which may form some excuse for the extensive and wholesale use of "John Barleycorn" and his demijohns, who are robbing the teamsters and railroad hands of all their earnings, their common sense, honesty and decency, and preparing them to board at hospital, States prison or insane asylum, at the expense of taxpayers.

Results of Whisky.

Whisky here, and at the different stations, is doing its accustomed work of degrading, and destroying every principle of honor, honesty, justice or decency, and all carried on by legalized licensed bosses. I will spare any description of the loathsome spectacles presented as evidence of their progressive work, and take it for granted that wherever men are *licensed* in this same business, they will give enough of similar results. The hopeful side of the question is found in a remark made by one at another station. He said, "As soon as we get rich and respectable, we will quit the business and move somewhere among strangers." Aside from the moral aspects of the question, there is not today anything so damaging and so thwarting to all settlements and progress in mining developments as this great curse of the nation, legalized and maintained by our high courts. Nor would I wish to be understood that only the new camps on new railroads are fully controlled by these doggery keepers, for the same is too true in every little mining camp; as soon as there is any prospect of one paying mine, at least one licensed deadfall must be planted near by. If a small smelter, or a quartz mill is built, from five to ten saloons are hastily erected. While visiting a smelter in Yavapai county, the furnace had to "be banked," *i. e.*, draw off metal fused and the slags, and remove the blast pipes, and plug up the holes, and let all remain quiet for about ten hours. Asking why, was told, "Have no ore at the furnace, the mine car broke, and the blacksmith was drunk and could not fix it, and the ore could not be put forward to the dump."

I left Ash Fork near sunset to visit the Colorado river at the Needles. Before dark we came to the "Muleshoe," where to gain an eminence they double back three or four miles, making the long narrow bend of a muleshoe, and then bringing you very near by, but above the lower end of the shoe. The scenery is grand and diversified; here well timbered, and mountains, then plains bare, or covered with small scattering small trees; water generally lacking and but few bands of sheep or cattle near the road.

The altitude of the road and the nearness to high mountains insures always a pure and healthful atmosphere.

Those desiring recreation and the enjoyment of

Grand Natural Scenery,

Combined with hunting and fishing, they can find it abundant on this route. From Ash fork to Peach springs, sixty-five miles, you descend 2,000 feet and are yet about 5,000 feet above the sea level, and if you desire to see the grand canyon of Colorado, Peach springs is the starting point. Eighteen miles drive down New river wash is a pleasant introduction to the grandeur you find when you reach the junction of Diamond River canyon one mile before its entrance into the Colorado. At this very interesting point, Young & Farlee, of Peach springs, who own the toll road and the stage line, are building a two-story house for the comfort of their visitors and passengers, who all need at least two days to do the climbing and seeing the wonders of these illustrated pages in geology—Palisade, Steeple, Cone, Haystack, Chimney, Castle or Dome—it matters not what fancy names may be applied to these monuments. They are on so grand a scale, that the name seems to be entirely lost. "I would not missed seeing that for anything," said an Ohio judge as he returned more tired than his trusty mule that had just elevated him about 2,700 feet in carrying him from the canyon to Peach springs.

The road is free from all dangerous aspects, nothing to shock the nerves with sense of impending danger. The famous springs with the peach orchard is in this canyon, four miles from the depot. They now belong to the A. and P. R. R., who have a steam engine pumping the water over the ridge into tanks for the supply of the railroad engines. The peach trees and the garden now are neglected, while their former owner has taken his $2,000 and gone to seek lands elsewhere. About 100 miles of heavy down grade on the railroad brings you to the low plane of the Colorado river, where perspiration can be had without any artificial aid, and one day will suffice to give full appreciation of the higher altitudes.

I forgot to explain to you that the rumbling thunder heard at Hackberry station, and causing some apprehensions of floods and washouts, was only the stamps of the Hackberry quartz mill about one mile off working some of their rich ore lately struck in their mines. John Howell is just naturally lucky in stopping right with a mine till it pays him the money. Some say, "he isn't so very smart, but just knows enough to hire the right kind of men to run his different works." And that little mill by the side of the railroad with so many small sacks standing around, was a small sampling mill where disinterested parties crush and sample ores, and by the assay of these samples the price of the ore is fixed and sales made.

Large Establishments

Are now being erected in good mining centers, especially in Colorado, to receive the full shipment of ores to crush, sample, and then supply dealers with samples, and receive bids on those samples and sell as advised by the owners of ore.

The mines near the railroad can ship their ores to the sampling mill, where the larger pieces are broken and all properly mixed and piled evenly, and this pile divided, and a fourth of it taken and passed through a crusher to give it a more uniform fineness, when it is piled on the floor in the same shape as was the larger pile and carefully divided, and from it another sample taken, and this passed through a finer crusher, and so on reduced, divided and sampled until a small quantity, as a sample, is reached, and this sample is then reduced to a fine powder, and bottled and marked with the number of the lot thus sampled. Buyers and sellers rely on this as the true average sample for assay value of the entire lot. In large lots this sampling process costs two dollars per ton. It seems to be the umpire between the prospect miner and the capitalist with his reduction works, and does away with all dickering in the transactions, and insures equity to both parties.

Mohave County Mines

That formerly were so inaccessible, and yet worked to profit, can now smile as they hear the locomotive scream echoed through her deep canyons and mountain cliffs. Mohave, rich in mines and in its flocks and herds could afford to wait for outside capital to come with a continental railroad through their favored lands and give them a market at their doors for their staple products—metals, meats and wool. Was pleased to see the genial face of Robert Steen, sheriff of Mohave county, who honored the same office for several years in Nye county, Nevada. I say pleased to see him, but disappointed in not being able to speak with him. He seems to be his own hired man and doing the hard work himself.

Mohave has a very small area of agricultural lands, lying mainly in the valley of Big Sandy, and a small portion on the Colorado. Her pride is in mining and stock raising—each of which enterprises is yet in its infancy—and offer, as do all the northern counties, good opportunities to the prospector for mines, or cattle ranges, and for health resorts. The altitudes, as given for the A. and P. R. R. stations, range from 4,890 feet at Peach Springs, to 6,935 feet at Flag Staff, 122 miles from the summit of the route and the great pine timber belt of the Territory. From this summit eastward 343 miles to Albuquerque, in New Mexico, the elevations vary slightly, and decline to 5,006 feet at Albuquerque. The altitude can be greatly varied within ten miles north or south of the railroad at some points. I have been more particular to mention some of these points, because I have met parties who claim to have fled from the cold Northern and Eastern States in the first stages of consumption and asthmatic troubles, and now claim to be sound and healthy, as the effect of a high, dry and mild, yet invigorating atmosphere.

This is nature's sanitarium, and all open and free to select Government or railroad lands, for all are ready for the settler. No hostile Indians within hundreds of miles.

The Only Indians

You will see on the route are near the New Mexico borders, and they are hard at work in their corn or grain fields or making hay while the sun shines. Several of these Indian families got on the cars at one of the stations at night, and no white man gives better attention to the comforts of wife and children than did these Pueblo Indians. There are immense tracts of coal fields within five miles of the road, with veins of great thickness and excellent quality.

The Petrified Forest,

Of miles in extent and well timbered with crystallized trees giving the finest specimens for the lapidary of precious opals and the various named gems, and often the hollow center of the tree is fully set with glittering quartz of various colors. One of our fellow travelers who had visited Mammoth cave, Niagara, and the great sights of the world, said this impressed him as grand beyond any other, and considered it worth the trip. He chided the idea of going across the Atlantic ocean when greater wonders are to be found here right at home, and made now so easily accessible even to the aged and the invalid. This whole Territory north and south is a land of antiquity, filled with wonders and mysteries, and abounding in vast treasures, inviting capital, energy, science and mechanical skill to successfully develop these resources and plant here the broad principles of American institutions. The present aspect is favorable and progress is sure and onward.

B. W. CROWELL.

Albuquerque, N. M., Aug. 15, 1883.

What Bodie District Produced.

Below is given the bullion shipments made by four of the companies operating in this district during the first six months of 1883. There has been considerable gold dust sent out by private parties of which there is no record. The figures given show up well and indicate that our mines are not yet exhausted, as many people imagine. There is a good field yet to be explored in this district, and when the mining industry emerges from under the cloud that seems to hover over it and depress it, still better results may be looked for. The Syndicate mill was closed from January 1st to April 1st:

STANDARD CON.

1883.	Gold.	Silver.	Total.
January	$5,499.03	$13,904.52	$99,403.55
February	107,347.28	14,466.10	121,813.38
March	75,899.10	9,311.52	85,210.62
April	97,939.10	14,796.16	112,735.26
May	98,984.98	12,671.36	171,656.34
June	98,416.03	13,956.95	112,372.98
Total			$643,192.13

BODIE CON.

1883.	Gold.	Silver.	Total.
January	$10,980.43	$15,088.42	$26,077.85
February	9,577.62	16,712.53	26,290.15
March	7,754.69	13,705.69	21,460.38
April	9,692.86	15,395.04	25,087.90
May	13,277.51	18,902.44	32,179.95
June	7,996.53	10,188.09	18,184.62
Total	$59,288.64	$89,992.21	$149,280.85

SYNDICATE.

	Gold.	Silver.	Total.
January	$8,562.58	$864.70	$9,217.39
April	4,552.95	315.97	4,868.92
May	5,589.82	393.52	5,987.34
June	8,416.15	626.35	9,042.50
July	8,683.96	615.72	9,299.68
Total			$38,415.83

BODIE TUNNEL.

January	$9,644.95
February	10,471.19
March	12,249.43
April	10,467.64
May	6,714.31
June	3,194.71
Total	$52,742.23

The grand total foots up $83,631.04. The Bodie Tunnel Co. made only two shipments during June, the mill closing down before the end of the month. The shipments of the Standard mine during July amounted to $95,208.24. In the Syndicate statement the shipment for July is included.—*Bodie Free Press.*

ENCOURAGEMENT FOR OUR COPPER MINERS. It may encourage our owners of copper mines to know that the Calumet and Hecla copper mine, on the south side of Lake Superior, yields but four and one-half per cent of metal. The copper mines of Sweden are worked at a profit, notwithstanding the ore yields but one or one and one-half per cent, and a little silver, while the Newfoundland copper mines, which are considered very valuable, yield (according to the return of sales at Swansea) only six and one-quarter per cent. Our copper prospectors would hardly take a second look at even the best of the ores mentioned above. What they want are ores that show from thirty to sixty per cent.—*Enterprise.*

MECHANICAL PROGRESS.

Some Unobserved Phases of Electrical Progress.

The attention of the general public has been drawn of late years to the subject of electricity through the attraction of the dazzling electric light. Of the progress made during this period in other and perhaps more important applications of the science to the useful arts but little is known, since such matters rarely find their way into the popular literature of the day.

We refer here principally to the advances made in the application of electricity to chemistry, metallurgy and galvano-plating, which, though less attractive than the application of the science to illumination, are collectively of much more industrial importance. In the field of electro-chemistry, for example, eminent chemists and electricians have buised themselves in testing the theoretical views and opinions of their predecessors, have demonstrated the correctness of some of them; have modified others; and in some cases have advanced new theories.

The method of analysis by electrolysis, which until lately was but rarely employed in the laboratory, has, by reason of the discovery and systematic development of a number of new and reliable methods of determination and separation, not only become a valuable aid to the chemist in analytical work, but has become of the highest importance to the metallurgist.

The analysis of certain minerals and metallurgical products, which, until the origination and improvment of the electrolytic methods of separation, had been a procedure of great difficulty, is now readily accomplished, with rapidity and certainty, with their aid.

In metallurgy, the production on the large scale of metals, in a state of extraordinary purity with the aid of the electrical current, is now an accomplished fact, and the method is now firmly established as a technical and commercial success. Its eminent practical value is shown by the introduction of the electrolytic process in some of the most extensive metallurgical establishments.

In close connection with the application of the electrical current to metallurgical work, the utilization of the heat of the voltaic arc for the smelting and working of metals deserves to be mentioned. In this direction, the electrical smelting furnace of Siemens—a device that has attracted profound attention in scientific circles—suggests the possibility that within a few years the metal worker may have placed at his disposal a source of intense heat, which may prove of enormous value.

Again, the separation of metals from particles of mingled iron, and the purification and concentration of ores of iron, by electrical means, has come to be quite a useful and important operation.

Galvanoplasty, or the art of producing metallic deposits upon objects of metal, etc., for artistic or useful purposes, has of late years been enriched by a long series of new and improved methods, which have had the result of elevating its practice from the stage of empiricism to the rank of a recognized branch of applied science, based upon accurate scientific methods. The role which the dynamo-electric machine—by which mechanical energy is directly converted into electrical current—has played, in developing and extending this important branch of electrical technology, we have elsewhere pointed out. It has contributed more than any other cause to the immense extension of the art of electro-plating in all its branches; it has called nickel plating into existence; and by greatly cheapening the cost of a multitude of artistic and useful objects, has placed within the reach of those of slender means, even, the possession of beautiful and serviceable wares of great variety which are not distinguishable in elegance of appearance from the most costly articles which are of necessity the exclusive property of the rich.

In addition to these notable evidences of progress, we might enumerate a large number of new and interesting inventions and discoveries, extending the application of electricity to the most diverse branches of industry, and these are being extended day by day. It is true that many of these will probably not stand the crucial test of practical application, but this fact does not detract from the strength of the assertion that the most valuable applications of electricity to the industries are those which are only brought indirectly to the knowledge of the general public.—*Manufacturer and Builder.*

Concerning Belts.

The *Trade Review* has collated a few useful hints as to belts, from various but recent sources. A new belt needs to be "bedded down" to the pulley before it can do effective work. A riveted belt takes longer to do this than those which have the plies cemented or sewed together. Increasing the width of the belt is generally a benefit, especially when the tension is heavy. When a belt commences to get full of animal oil and dirt it loses its efficiency. For slipping belts various remedies are proposed. Printers' ink gives temporary relief, but creates glaze. Coal tar and flour have been recommended for exposed belts running close over water. For rubber belting, whiting, applied as a dry powder, is good. Oiling with castor oil, to make pliable, is highly recommended for leather belts; but neatsfoot oil should never be used, nor should oil in any form be used on rubber belts. The best plan, both for the preservation of belts and the protection of life and limb, is to box them. Among the elements that enter into belt depreciation are, length, width, thickness, strain, friction or power to transmit tension, proper adjustment, temperature, manner of joining and moisture. Oak tanned belts last one-third longer than those chemically tanned. Running the belt on too tight a pulley will generate heat, decompose the oil and organic matter in the belt, and hasten its decay. Vertical belts are the most difficult to manage. Short driving belts depreciate more rapidly than any others. It is estimated that such belts need renewal every 10 or 12 years, and that for flouring mills the depreciation is 10 per cent; for iron workers, 12½ per cent; and for wood workers, 20 per cent. An experienced engineer says he has made a belt last him 10 years, by each Saturday evening turning the inner side out, washing it well with warm water and soda, scraping and oiling it, and then going over the same operation Monday morning before starting the machinery. By doing this and keeping his pulleys clean, he finds that they will run at full speed with five pounds of steam when the belts are on loose pulleys, while a larger engine alongside, to which no such attention is given, cannot run with less than 38 pounds under like conditions.

New forms of belts are constantly appearing. Hair belts are in use in Germany, but their cheapness over leather belts is doubted. A new method of manufacture, applicable to rubber, woven tissues, or gutta percha, consists in making the belt with longitudinal ribs or grooves, to increase its strength and prevent stretching and variations. Still another is to groove one side of the belt the same as saw teeth, then to put these two pieces together, thus obviating warping.

Mechanical Progress, as Shown at the Paris Exhibition in 1878.

The report of M. Hirsh, Secretary of the jury in charge of the department of machinery at the late Universal Exhibition at Paris, has just been made public, and though too much time has elapsed to make it probable that it will be of any material service, save for comparative reference in the future, some of the views that he advances are worth noting and reproducing. The paragraphs quoted below, from *Science*, relate to his summary of results:

"One remarkable feature of the exhibition was the absence of valueless and eccentric devices. * * * In studying progress it is noted that the gain is considerable in every direction. In the production of steam, the more general use of heaters of the feed-water is observable; the use of tubular and of the safety forms of boilers is increasing; superheating is oftener practiced; better material and workmanship are seen.

"In steam engine practice, the use of higher steam of greater expansion, the adoption of two types exclusively—the compound of the Wolff type and the American forms of single cylinder engines—greater speed of piston and rotation, the use of better material and workmanship, are the characteristics of recent practice. Rotary engines are given up. Air and gas engines are extensively used, but only for small powers. Among the hydraulic motors, the turbines are principally used, and have attained great perfection in practice as in theory. Aerostation has made no great progress, notwithstanding the interest it continually awakens.

"American exhibitors distinguish themselves by the boldness and ingenuity of their designs, and by their entire independence of tradition. Their devices are adapted precisely and effectively to their work."

The following quotation from M. Hirsh's work summarizes briefly his opinion of the American method of design and construction: "*Les Americains s'attachaient avec energie a l'idee primiere, a l'idee juste; ils l'amelioraient, la perfectionnaient, et meme au prix des grandes complications de mechanisme, ils finissaient par la faire triompher, et par l'imposer de nouveau a l'Europe.*" The English of which quite complimentary allusion to our mechanical methods is, liberally rendered, as follows: "The Americans aim directly at the object to be reached; they improve, they perfect, and, even at the cost of great complication of mechanism, they end by triumphing, and by forcing Europe to accept their results."

WIRE DRAWING.—It was not until some time after 1300 that wire-drawing became an art. A race of wire-drawers, who made iron wire by hand and afterwards by water power, then sprang up in Germany and became famous in Europe. Wire-making was introduced in England about the middle of the fifteenth century. This industry was commenced in the United States at the beginning of the present century, and it is needless to say that it has grown to enormous proportions within the past few years.

A POINT ABOUT BLACKSMITHS' FIRES.—A common trouble in country blacksmith shops is the going out of the fire while the smith is doing work away from it. This annoyance can be prevented by keeping at hand a box containing sawdust. When the fire seems to be out, throw a handful of sawdust on the coals and a good blaze will quickly follow. This may seem a small matter, but there are many who will find my suggestion a useful one.—*Blacksmith and Wheelwright.*

SCIENTIFIC PROGRESS.

Effect of Alcohol upon Digestion.

It cannot be claimed that we have yet learned all that is to be known about our stomachs and the reactions that take place within them, notwithstanding the fact that one man, at least, lived for many years with an *open window*, as it were, in his stomach.

Every contribution to our knowledge of the subject based on real, first hand, experimental proof, has some value, hence we think that the recent experiments of Dr. P. J. Spenzer upon the effect of wine on the medical properties of pepsin are worthy of careful and thoughtful attention, imperfect as they are.

Pepsin, also known as chimosin, is one of the active ferments of digestion. For medicinal purposes it is prepared by scraping the well washed stomach of a hog, and in this state possesses the property of dissolving a large quantity of coagulated albumen, such as the white of egg. Dr. Spenzer, in his paper read before the Ohio State Pharmaceutical Association, gives the amount of white of egg (hard boiled) that will be dissolved by one grain of the pure pepsin, of different makers, when mixed with eight drops of pure concentrated hydrochloric acid in six hours. The amount varied from 68 to 170 grains, with an average of about 80 grains.

He found that the acid alone would dissolve half as much as the acid and pepsin, or 40 grains, and that eight drops of acid and 100 c. c. of ten per cent alcohol would dissolve as much albumen as the ordinary commercial pepsin and acid would together. This would make alcohol equal to pepsin as a digestive agent for egg albumen. For raw beef the case is quite different; acid and alcohol having less power than acid alone, while acid and milk sugar dissolved as much meat as the best pepsin with acid.

It is to be regretted that alcohol was not tried in combination with pepsin.

In conclusion, Dr. Spenzer states his conviction that an hour's exercise in the fresh air is equal in digestive power to any usual dose of pepsin, regardless of maker. When commercial pepsin is used it should be as fresh as possible.

H. Seeman has proved that free hydrochloric exists in the stomach, although the presence of peptones prevents its detection by means of methyl violet. This is probably one reason why it has so long been an unsettled question whether it was hydrochloric or lactic acid that gave the acidity to the gastric juice.—*Scientific American.*

Centrifugal Force.

Professors Ayrton and Perry exhibited at a recent meeting of the Physical Society an ingenious lecture apparatus for demonstrating the laws of centrifugal force. As was properly pointed out by Professor Ayrton, the ordinary lecture apparatus of this kind do not really demonstrate the laws of the subject, but simply show the effect; and a new and more scientific class of apparatus is demanded by the extension of scientific teaching. Professor Perry and he had been engaged in designing new apparatus to meet the wants of their City Guilds students, and the apparatus shown was one of the instruments in question. It consists of a rotating vertical axis carrying an aneroid chamber filled with mercury, which also rises in a graduated capillary tube projecting from its middle. A metal arm projects at right angles from the aneroid or diaphragm side of this chamber, and carries a sliding weight which can be shifted to different distances on the graduated arm. On rotating the axis the centrifugal force of the projecting arm pulls on the elastic diaphragm of the mercury chamber, and the mercury within it having more room sinks in the capillary tube by a corresponding number of degrees. The apparatus is capable of demonstrating the law of centrifugal force with accuracy, according to experiments which have been made; and, as Professor Guthrie remarked, it could be used for indicating the speed of wheels and shafts. We may add that there is already a mercury counter in existence, in which a closed mercury chamber is rotated, and the parabolic concavity given to the mercury by the centrifugal force is employed to measure the speed.—*Scientific American.*

NEW AND STALE BREAD.—A celebrated French chemist, M. Boussingault, has recently been engaged investigating the nature of the change which takes place when bread becomes stale, something which has hitherto not been understood. In the course of his experiments a circular loaf, twelve inches in diameter and six inches thick, was taken from an oven heated 240° Reaumur, and a thermometer forced into it three inches. The themometer indicated 78° R. (207.5 F.) The loaf was then taken to a room, the temperature of which was 66° F., and temperature of loaf sunk to 73° F. and in twenty-four hours to 66°, and in thirty-six hours to 63.5°. In the first forty-eight hours it lost only two ounces in weight. After six days the loaf was again put in the oven, and when the thermometer had indicated its temperature had risen to 156° F, it was cut open and found to be fresh, and to possess the same qualities as if it had been taken out of the oven the first time; but it had lost twelve ounces in weight. Experiments were made with slices of bread with similar results, proving conclusively that new bread differs from the old, not by containing a large proportion of water, but by a peculiar molecular condition. This commences and continues to change during cooling, but by again heating the bread to a certain temperature, it is restored to its original state. It is the mechanical state which makes new bread less digestible than old. The former is soft, elastic and glutinous in all its parts, and ordinary mastigation fails to reduce it to a sufficiently digestible condition.

EXPLOSION OF CARBONIC ACID.—L. Pfaundler placed a sealed glass tube, which was about two-thirds full of liquid carbonic acid in a bath of carbonic acid and ether, which had been reduced to a temperature below 100° (−148° F.), in order to obtain crystallized carbonic acid. Beautiful, transparent, strongly refracting crystals soon appeared, which completely filled the submerged portion of the tube, while a layer of fluid carbonic acid floated over them. After a few minutes the upper end of the tube, which was exposed to the air, suddenly exploded with a loud report. The same tube had previously been often exposed to a temperature of more than 31° (55.8° F.) It is possible that the glass, at this low temperature, became so brittle that it could not bear the steam pressure of the still fluid portion of the carbonic acid and the influence of the temperature of the air. But it seems more likely that the solid carbonic acid burst the tube in consequence of its thermal expansion. *Ann. der Phys. und Chem.*

THE auditory nerve, divided into some three thousand harp-strings, is incapable of receiving impressions from finer vibrations than those pertaining to sound. The delicate organism of the inner ear may be injured so that ordinary audition is impossible; yet, if the little harp be intact, the proper rates of vibration may be communicated to and received by it through other nerves which lie in the immediate neighborhood. A deaf person may often be made to hear the twanging of a stretched cord or wire, one extremity of which is held in the teeth. The sound is communicated through the bones of the head to the inner ear. The audiphone held to the face or any fleshy part of the person will give no result, and it is valueless to those whose teeth are "marvels of art." Nor will the audiphone accept the lower jaw as even passing good substitute, for the mechanical separation of this from the head bones interposes at the joint an imperfect conductor.

VIBRATORY sensation is capable of development. Practice in the microscopist gives him a power of vision which the uninitiated little dreams of. The piano tuner will discover an inharmonious element in a musical chord, which to another would be utterly unappreciable. The tea taster will detect a shade of flavor or value between samples which to the uneducated would be precisely similar. The physician readily recognizes the odors of diseases, in some instances, when these are sufficiently concentrated, but when the vibratory antagonism of the molecules of these have separated them until there is no more than the highest homœopathic attenuation in the atmosphere, there may still remain sufficient of both quantity and intensity to reproduce the parent disease.

EFFECT OF PRESSURE ON THE MELTING POINT OF ICE.—The experiment of Bottomley, which apparently illustrates the fact that increased pressure lowers the freezing point of water, is well-known. A wire weighted at both ends is thrown over a cake of ice and cuts through it. The ice melts beneath the wire and freezes above it. Professor Guthrie, at a meeting of the Physical Society held in London, April 28, 1883, gives his reasons for believing that the wire conducts heat to the ice from the atmosphere and that the experiment does not illustrate the well-known fact that increased pressure lowers the freezing point. A silk wire, weighted to the same amount as a metallic wire will not cut through a block of ice.

LAND CULTIVATION OF SEA WEEDS.—London papers say that "the secretary to the Royal Botanic Society recently tried the novel experiment of planting sea weeds in ordinary earth. It would naturally be supposed that these 'flowers of the ocean' would not flourish away from their native element; but this is not the case, most of the specimens planted having grown admirably in soil which is constantly kept in a moist condition." The result is both curious and suggestive, and worthy of trial this side of the ocean.

STARCH FROM SUGAR.—Everyone knows nowadays that we can make sugar (one kind at least) out of starch; but as yet we are no more able to reverse the operation than we are to combine carbonic acid with water or alcohol to make sugar. Bohm's experiments go to show that in the plant both operations take place, viz: making sugar from carbonic acid and the conversion of this sugar into starch, the chlorophyl grannles being the agent that aids in this change under sunlight.

PROF. VOGLER considers that a part of the duty of observers at meteorological stations should be to ascertain the quantity of oxygen in the air from time to time, as he believes that the percentage of it varies, or is intimately connected with barometric changes.

Mining Share Market.

There is not much of interest to chronicle in connection with the mining share market. Little activity has been shown or no developments of any exciting kind have occurred for some time in any of the mines called on the Board. On the Comstock the present points of interest at the north end are the south drift in the Union Con., and the joint Sierra Nevada winze below the 3000 level. The Sierra Nevada folks have not yet gone into the north drift, left at their south line by the Union Con. Co., for the reason that the supply of air is insufficient for three gangs of miners. This drift and that south in Union ground being on the same line makes square work north and south. The drift will be extended a proper distance into the Sierra ground before a crosscut is made. They are making good headway in the Ophir in opening out on the 150 level in the old ground. At Gold Hill some ore is still being extracted by the Yellow Jacket, and considerable work is being done in the way of exploration; but at the Crown Point and Belcher not much can be done until the mills on the Carson river are able to resume crushing to their full capacity.

Bullion Shipments.

Ontario, Aug. 21, $8,727; Alice, 23d, $11,138; Ontario, 23d, $4,595; Horn Silver, 23d, $12,000; Ontario, 25th, $4,568; Horn Silver, 25th, $12,000; Stormont, 26th, $2,620; Hanauer, 26th, $3,850; Ontario, 26th, $4,410; Horn Silver, 26th, $12,000; Alice, 28th, $11,176; Hanauer, 28th, $7,200; Crescent, 28th, $8,365. During the week ending August 25th, inclusive, there were shipped from Salt Lake 43 cars of bullion, 1,086,750 pounds, sent East; 21 cars of ore, 440,000 lbs., sent to Colorado, and one car white lead, 22,500 lbs., sent East, making a grand total of 65 cars, aggregating 1,549,070 lbs. Mt. Diablo, 28th, $21,634; Tombstone, for July, $83,000; Mt. Diablo, 23d, $6,568; Bodie, 27th, $7,073; Standard, 27th, $13,663; Northern Belle, 27th, $3,647.

THE production of copper in 1882 was 91,646,232 pounds, worth, at an average of 17½ cents per pound in New York, $16,038,091. For the first half of 1883 the production is estimated at 58,000,000 pounds, worth, at an average in New York of 14.65 per pound, $8,500,000. The spot value of copper at the point of production is a matter which cannot be stated with any accuracy, nor was any attempt made to ascertain the number of tons of copper ore mined. In 1882, 3,325,000 pounds of blnestone, worth $191,187, were made; and in the first half of 1883 the manufacture of bluestone is estimated at 1,662,500 pounds, worth $95,593.

THE Salt Lake *Tribune* hears that arrangements are being entered into with local smelters to have the ore from the Bullion, Beck and Champion mines, in Tintie district, melted in this valley, instead of shipping it out of the Territory as ore. There are over 100,000 tons of ore to work up.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

BLUE GRAVEL.—Amador *Dispatch*, Aug. 25: This claim is about nine miles above Sutter Creek, on the Wise toll road, and has indications of being one of the richest and most extensive gravel discoveries ever made in the county. The claim embraces about 40 acres, every portion of which prospects well from the surface to the bedrock, about 12 ft. The mine has a most favorable location, being a part of a basin or flat some 200 ft below the summit of the ridge and on which a large reservoir has been constructed. They will have plenty of free water for several months

MAMMOTH.—*Ledger*, Aug. 25: A contract has been let to run the remaining 400 ft of the upper tunnel, to strike the shaft. The contractor is an Austrian; the price is $3.50 per ft. The last contract was for $3.75 per ft.

REPORTED STRIKE.—Reports are in circulation of an important strike at Amador City. In the South Spring Hill claim, in running a crosscut, a ledge 4 ft wide was cut. The rock, it is said, shows plentifully in free gold.

THE MIDDLE BAR TUNNEL.—The work of starting the big tunnel at Middle Bar was inaugurated Wednesday afternoon. The water supply, however, was found to be inadequate. There is some defect in the laying of the pipe. This may take a day or two to remedy. The contract has not yet been let, although parties stand ready to take it at $10.25 per foot. In a few days this huge undertaking will be in full blast.

MISCELLANEOUS.—The Morgan claims at Murphy's gulch are still idle, and it is not likely that work will be resumed for several days yet. The Plymouth Con. M. Co. declared its third dividend on the 9th instant, of 50 cents per share, amounting to $50,000. The Oneida mill is at work on rock from the Jackson mine. The Kennedy mill is running on ore from the St. Louis claim near by.

AMADOR CON.—Sinking at the Amador Con. still progresses. I am informed that only 50 ft more remains to be sunk before drifting will be in order. It is said that good ore has been struck in the shaft.

Calaveras.

WEST POINT.—Cor. of *Chronicle*, Aug. 25: The main shaft of the Scorpion mine is down to the depth of 100 ft, with the finest kind of prospects. No. 2 shaft of the same mine is down about 90 ft. They are sinking an air shaft, which will enable them to get at a rich body of ore which heretofore they have been unable to get at on account of foul air. In the Star of the West the prospects are encouraging. They are still sinking on very rich rock, and are down to the depth of 230 ft. The machinery and building, formerly of the Carlton, is now being put up on the Henry mine. The main shaft of this mine is down 100 ft. On the Wide West mine Mr. Sterling has erected a large water wheel for hoisting and pumping, and has commenced sinking on a 4 ft ledge. The Ohio Con. mine is situated between the south and middle fork of the Mokelumne river, and has the largest ledge that has ever been developed in this section of the country. It is cut 18 ft wide at the south end of the ledge, and a tunnel run into it 81 ft; the ore will mill from $35 to $45 per ton. At the north end they have run a tunnel on the vein, which is 5 ft in width, and the ore will mill from $500 to $1,000 per ton. There is rock enough in sight now to run two 50-stamp mills for the next 20 years. We hear that it is the intention to erect two 50-stamp mills, one on each fork of the river.

Fresno.

MT. RAYMOND.—*Expositor*, Aug. 22: S. L. Hogue has recently returned from Fresno Flats. He reports times very lively. He says the Mt. Raymond silver mines are attracting much attention, and he predicts that there will be as big an excitement over them as there was over Bodie and Mammoth a few years ago. He says that Dr. Ball and Robert Harlow showed him specimens that assayed over $200 per ton in silver.

A MOUNTAIN OF SILVER.—The Mariposa *Herald* of 24th inst., says of Mt. Raymond, in a dispatch of late date: Mr. Smart, Constable of Fresno Flats, was in Mariposa Saturday. He said that every man in Fresno Flat had gone to Mt. Raymond. We left on horseback for the Flats. We proceeded to interview the mine owners. Every man we talked to was interested in a claim, and not one of them was worth—in his mind—less than a million dollars. Mt. Raymond for 4 miles was represented as a solid mass of silver ore, that assayed from $100 to $150 per ton, all smelting rock and easy to mine. Seventy locations had been made and a new mining recorder elected. From 50 to 75 prospectors were on the ground and hundreds on the way. One saloon had been started and a boarding-house would be opened in a few days. Old prospectors and good miners asserted that the famous Comstock was a prospect-hole in comparison, and that next year the biggest mining camp ever seen on this coast would be at Mt. Raymond. Several claims had been bonded by the agents of Senator Sharon and George Hearst.

Mono.

STANDARD CON.—Bodie *Free Press*, Aug. 21: During the week there was extracted and shipped to the mill 1,116 tons of ore; crude bullion received 2,480 ounces. The east crosscut 1200 level was advanced 14 ft; total length 48 ft. North drift No. 1, 1000 level, was run 12 ft; total length 291 ft. The vein is 2 ft wide.

BODIE CON.—During the week ending the 18th there was 144.085 tons of ore hauled to the mill and 145.275 tons crushed. The average assay value of the pulp was $40.01 per ton; that of the tailings was $6.36.

BODIE TUNNEL.—The west crosscut on the 250 level was advanced 13 ft during the past week. The south drift on the 200 level was extended 10 ft. The ledge looks well, and higher assays are being obtained.

BULWER CON.—The west crosscut from the north drift, 500 level, is in 409 ft; progress 13 ft, in hard ground. The south drift from west crosscut No. 1, 500 level, is in 221 ft, showing a vein 2 ft wide.

Nevada.

MAGENTA CON.—Grass Valley *Union*, Aug. 22: Arrangements have been made to put up hoisting and pumping works on the Magenta Con. mine, and the work of placing the steam machinery will soon be commenced. The machinery will be set up over the old shaft, which is down 350 ft. The Magenta adjoins the Empire mine on the same lead.

BULLDOZER.—Tri-weekly *Herald*, Aug. 25: J. C. Locklin is engaged in prospecting the Bulldozer mine on Deer creek, opposite Worrel's ranch. Mr. Locklin has an overshot water wheel supplied with water from the creek and conducted to the wheel by a ditch, 2,000 ft long. This wheel furnishes pumping and hoisting power. Already 15 tons have been taken out and crushed with satisfactory results.

San Bernardino.

LAVA BEDS.—Cor. Calico *Print*, Aug. 25: The Morning Star Co. are working their complement of men. The various openings and other workings are showing up, without exception, bodies of high grade silver ore. I am informed that in a few days a shipment will be made. An assay office is in coarse of construction. The Sampson mine, which joins the Morning Star on the east, is being opened up with a small force of men; in the two openings made exceedingly rich ore is being extracted, giving promise of large deposits as depth is attained. The Meteor is owned by the Morning Star Co., and is looking well, carrying the same character of ore as that in the other mines. The Mammoth Chief, owned by the Clark Bros., is a splendid property. The Clark Bros. also own the Desert Queen which adjoins on the west. The Lizzie and Rattler are on the north of the Morning Star and show great promise, as also does the Glittering Star. The Wide West is being opened by Mr. Oakes and Jack Pascoe. They have a fine prospect. The above mentioned claims are all that have any work done upon them at this writing. Many other valuable claims will be opened this fall that will add to the general prosperity of the camp.

Shasta.

BULLY CHOOP.—Cor. of Anderson *Enterprise*, Aug. 25: The west tunnel on the Cumberland is in 195 ft. They will have to run twenty ft further to strike the supposed crossing of the Mammoth and Occidental ledges, when rich developments are expected. The Bully Choop shaft is down about 60 feet. I understand it is the intention to sink to a level with their lower tunnel and then form a junction. Mr. Thompson of the Caucasian, is taking out ore which he intends to have crushed. The Davis Bros. expect to resume work on the Pound Cake in a few days.

FURNACEVILLE.—Cor. of *Courier*, Aug. 25: The Afterthought will close down about the first of next month. Mr. Stewart, the Supt., is a man that will see that everything is right. He has the mine so well opened, that he is satisfied that it will pay well if sufficient ore can be worked. No work has been done in the mine for several days, but the chances are favorable that mining will be resumed soon, to continue all winter. There is a large quantity of wood at the mill, and all other necessary material to start with at once.

DEADWOOD.—*Democrat*, Aug. 22: We are informed that Frank Ballou has struck a quartz ledge in the Deadwood district that prospects $100 to the ton. The ledge is twelve inches wide and well defined. Dent Young has struck more rich quartz on Spring creek, from which he pounded out $20 in a mortar one day last week.

Sierra.

RUBY MINE.—Downieville *Messenger*, Aug. 25: The Ruby M. Co. discharged a number of men last week because the channel, 110 ft above the main tunnel, seemed to have been cut off both on the north and south by a deep channel filled with mountain lava. This deep channel has been known ever since the company ran the main tunnel, but no sustained effort has been made to prospect it. Later they started a tunnel 30 ft from the bottom of the main tunnel and pushed it eastward until they cut the rim. Down this rim has been sunk incline No. 2. Last Monday gravel was struck in this incline, and a good prospect obtained, one piece weighing $5. The prospects are now very flattering. This deep channel is undoubtedly the old Rock Creek channel. * * Since the above was written we learn that the incline is down 4 ft below the bottom of the main tunnel, the bedrock still pitching 1 ft in 3. It is a splendid bed of free gravel about 6 ft thick and getting thicker and coarser as it goes down, with a good prospect in gold. Supt. Jennings has started the main tunnel for it. Its being below the tunnel is of no great moment, as a few hundred feet north will bring the bedrock up. Our information comes from one who has had 30 years' experience, and who says: "In my judgment it is by far the best layout for a paying mine that the Ruby has ever had."

SUNNYSIDE.—The Sunnyside Co. have commenced work on their claim, having built a cabin about 400 ft up the ravine above the breakout on the Kimball ditch, where several thousand dollars were taken out years ago from a small spot.

Trinity

EAST FORK.—*Journal*, Aug. 25: James Moor tells us that Day, Moor & Co. have their arastra on East Fork completed; that they are now engaged in digging a ditch which will probably be completed within two weeks—that there is plenty of water in the creek for working purposes; and that they will be crushing rock from their rich ledge before many days.

STILL IMPROVING.—We learn that the Blakemore ledge, in Eastman district, which has been rich from the croppings down, has been found richer than ever during the past week.

QUICKSILVER.—Louis Girard, who has had charge of the retorts at Altoona, running on ore from Fred. Loring's mine, informs us that 32 flasks were produced.

Tuolumne

PATTERSON MINE.—Sonora *Democrat*, Aug. 25: This mine has been in steady operation, with a 20-stamp mill for many months with results so satisfactory that the owners are making some costly improvements. A new six inch pump, run by a Knight's wheel is being placed in position in the shaft. The shaft is down 620 ft, and is an incline, which gives a perpendicular depth of over 500 ft. This pump will handle all the water at a depth of 1,000 ft, to which depth it is intended to sink the shaft. The new machinery will be ready for operation by the first week in September. In the meantime the mill is undergoing some necessary repairs. When new levels are run, and the mine thoroughly opened, it is proposed to add twenty more stamps.

GREEN MINE.—The Green Mine presents an active scene; the mill is constantly crushing, while the

mine is being opened deeper. W. A. Clark, one of the owners, came down Tuesday with the result of the last crushing, which was a handsome amount of retorted gold.

DIVOLI.—The Divoli Bonanza mine, under the supervision of Capt. Colby, is prospecting immensely, a large body of rich milling ore being extracted.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Enterprise*, Aug. 25: The north drift on the 2000 level is progressing at the rate of 30 ft per week. On the 3000 level the north drift of the Union Con. has reached the Sierra Nevada line, but has not yet been extended as the supply of air is not sufficient. The joint Union Con. winze below the 3000 level is being sunk at the rate of 13 ft per week.

GOULD AND CURRY.—Good progress is making in east crosscut No. 2, on the 2500 level. It is in a vein of a favorable character. The pump at the Osbiston shaft is running at about eight strokes per minute.

UNION CON.—The north drift on the 3000 level has been carried up to the south line of the Sierra Nevada, and a south drift has been started in the belt of porphyry between the 30-ft and the 7-ft ore veins. The joint Sierra Nevada winze below the 300 level is being sunk at the rate of 13 ft per week.

IMPERIAL.—The work of overhauling the gallows frame at the Imperial hoisting works was commenced yesterday. It is intended to explore and mine the old upper levels of this mine, the Alpha and Exchequer.

HALE AND NORCROSS.—Although the winze below the 2600 level was drained a day or two since, but little has been done in the bottom owing to stoppages at the Combination shaft.

BEST AND BELCHER.—The drifts on the 2500 level are very wet, and it is found necessary to make frequent stoppages to allow the ground to drain out. The wet section lying between this mine and the Con. Virginia is, however, being steadily narrowed.

OPHIR.—West drifts Nos. 1 and 2, on the 150 level, are passing into ground of a promising appearance. The ore taken from the croppings is being sent down to the tunnel level through the old Mexican shaft.

YELLOW JACKET.—A large amount of ore has been opened up, but the quantity that can be reduced at present is limited, owing to the low stage of water in the Carson river.

MEXICAN.—Very fair progress is made in the raise going up from the 2900 level, though the rock is exceedingly hard. The north drift on the 3100 level is making rapid progress, in a favorable formation.

CON. VIRGINIA.—The south drift on the 2700 level is making fair progress.

UTAH.—Are making good headway in the north lateral drift on the 1350 level.

ANDES.—Some low grade ore is being encountered and of late considerable bodies of fine-looking quartz.

SCORPION.—The west drift on the 500 level continues in favorable material.

SAVAGE.—Nothing is being done on the 2600 level, but a start will be made soon.

CALIFORNIA.—At the joint Con. Virginia drift are taking up and conducting the water to the 2800 tank.

CHOLLAR.—Crosscutting will not be resumed until the new hydraulic pump has gone into operation.

ALTA.—Pumping water will be the regular business at this mine for three or four months.

UNION SHAFT.—Are easing timbers at the 2300 station.

Esmeralda District.

LOST INDIAN.—*Herald*, Aug. 25: A three foot vein of very fine looking gold and silver bearing quartz was cut last week. Umpstead & Latipe, are confident that the Lost Indian is a bonanza. Five tons of ore, now on the dump, will average $100 per ton. These gentlemen also own the Central mine, situated near the Lost Indian. A cut has been run tapping the vein at a depth of 20 ft, and has uncovered a four-ft ledge of $20 ore. In Powell Creek canyon, near Tom Stevens', they have a claim known as the New Discovery, from the croppings of which assays have been made, giving the flattering returns of from $200 to $700 per ton.

PERMELIA.—Nine miles south of Benton is the Permelia mine, one of the greatest gold ledges in Mono county. A shaft sunk on the ledge at the depth of 200 ft shows a body of good ore 20 ft in width. The assays from the mine average $75 per ton and upwards.

Pioche District.

THE DAY MINE.—Pioche *Record*, Aug. 18: The Day mine is in better shape than for a long time. It has been thoroughly put in order; the tunnels and drifts have all been cleaned out. The ore bodies have been drifted into and ore can now be extracted with little trouble.

COMET.—This district is coming to the front. There came to Poujade's ore-buying establishment, since our last issue, four lots of ore. They sampled 270, 302, 208 and 544 ounces, or in dollars assay value $336, $390, $268 and $703 per ton. All these came from Comet district, the richest being from the East Redemption mine, worked by Burrows & Glover.

BOWERY.—Pete Williams is extracting high grade ore in the Bowery mine. He is of the opinion that he has found the ledge that was lost years ago. He struck the ore at the side of the shaft.

Paradise District.

WILD GOOSE.—Winnemucca *Silver State*, Aug. 20: Yesterday a bar of bullion of the assay value of $2,832.51 was received at Wells, Fargo & Co.'s office here from the Paradise Valley mill. It was the first bar produced under the new management, and the ore which produced it was from the Wild Goose mine.

Tuscarora District.

ARGENTA.—*Times-Review*, Aug. 23: North crosscut, 400-foot level, extended 15 ft; total length, 30 ft. Ground continues very hard.

NORTH BELLE ISLE.—In the south drift, 300 level, the formation has been favorable and the drift advanced rapidly.

GRAND PRIZE.—West drift, 300 level, extended 20 ft, south drift extended 11 ft. South drift, 400 level, extended 10 ft.

ELKO CON. Fair progress has been made in sinking shaft No. 2. Present depth 91 ft, made the past week 12 ft. The streak of quartz shows great improvement. Hoisting machinery in perfect order and running smoothly.

BELLE ISLE. No. 1 drift north, 350 level, has been advanced 29 ft, and further progress for the present suspended and an upraise started at this point. No. 2 drift extended 12 ft. On the 450 level the north drift has been extended 8 ft. Vein continues strong.

NAVAJO. During the past week all the heavy parts of the compressor have been put in place, and it will now soon be in running order. All other work in and about the mine, is being pushed ahead rapidly.

ARIZONA.

MONARCH OF THE SEA.—Pinal *Drill*, Aug. 18: We visited the double shaft, from which they are taking fine ore. It is solidly timbered all the way. Thence we visited the tunnel which we explored candle in hand, also the drifts; it was 275 ft deep, showing metal all the way. The parties interested in this mine spare no expense. From the northern extremity of the King to their mine, about a mile, they were building a fine, level road. At the time, they were employing all the men they could get.

BLUE BIRD.—This property, in the Martinez canyon, is developing finely. The vein is capped with quartz showing galena. They have in a 20-ft crosscut a 12 ft seam of quartz carrying gray carbonate and galena. The walls are well defined and 12 ft apart. They have drifted 12 ft of solid ore in the vein.

AUSTRALIA.—Work is going on in the shaft. Good ore is found all the way and has been hauled to the Queen Creek smelter.

MOUNT VIEW.—On the Mount View the ore is being sorted for transportation to the mill.

NACOOCHA.—On this mine work is still going on, in a shaft. They continue to obtain fine ore, galena with silver. They employ three men.

SILVER KING.—At the mine and mill the work goes on as usual.

RICH ORE.—Prescott *Miner*, Aug. 18: Mr. Craigue, superintendent of the Dosoris mine, yesterday stated that he had about eight inches of ore at the end of his 700 ft tunnel. This ore is worth $3,000 to $6,000 per ton. Nineteen men are at work in the mine and Mr. Craigue will soon ship a carload of rich ore to New York. Other gentlemen who visited the mine were dazzled with its exhibition of silver. Rich ore has been found in several extensions on the Pine Spring. United Verde Copper Co.'s smelter is running successfully. Messrs. Vanderbilt and Burton are sinking in the King Kelly mine, Groom Creek district.

HOWELL REDUCTION WORKS. Prescott *Courier*, Aug. 14: The Howell works are making a splendid record. Gentlemen who arrived last evening tell us that 100,000 pounds of bullion were yesterday loaded on teams, which are now on the road to the A. P. railroad. Twenty tons more are at the smelter, awaiting transportation. Smelter and mill are kept going night and day. Pack trains are constantly employed, bringing rich silver ore from the company's Blue Dick mine.

It is reported that Mr. Chase has struck it rich in one of his Turkey creek mines.

ARIZONA AT THE DENVER EXPOSITION.—Tombstone *Epitaph*, Aug. 14: Tombstone district makes a handsome display. There are more mines represented in this district than in any other in the Territory. The Contention mine has a fine line of porphyritic gold and silver hearing specimens. This mine has paid the owners $2,762,500 in dividends within the last four years, and is holding up to its usual output. The Grand Central mine has some fine specimens on exhibit, which are much like those of the Contention. The Grand Central has paid over $900,000 in dividends and keeps up to her usual output of 85 tons daily. This property is valued at $7,000,000. The Tombstone M. Co. are well represented by specimens from their mines, among which is a very fine one of telluride of gold and silver, which averages $4,000 per ton. This company has paid $1,850,000 in dividends.

COLORADO.

INMAN.—Mining *Gazette*, Aug. 18: The Inman lode was discovered in May by Scott Griswold. It is close to Chicago Creek in Jackson district. It is a well defined fissure vein carrying from four to nine inches of decomposed quartz at grass roots which assayed here gave silver 465 ozs., copper, 4.5 per cent. Total value, $518.25. This is without doubt the greatest find ever made on Chicago Creek and will be hard to beat in the State. The vein is not less than six feet between walls in any place exposed.
